We know of no article of consumption in the report accounts of the Board of Trade, upon which we can place our finger, that will show a greater or more continuous increase than the simple unit of the egg. Unimportant as it might have appeared some years ago, it has gone on from thousands to hundreds of thousands, and then to millions, until the quantity seems incredible, and could only be realised in extent by the measurement of tons weight. All this represents so much food required by the necessities of one portion of the population, or the luxuries of another; for the frugal and solitary breakfast of the man of letters, to mix on the table with the more numerous viands of the social family party; or to be called into sudden requisition in aid of the housewife when the casual visitor

On 1. These are the ostensible signs of consumption, have associated appears everywhere, and yields to every turn of art—in pastry of all kinds, in confectionery, in the making of ices, sometimes in medicine; in Sherry state unfit for the table it refines our Brandy leather that preserves whiteness to Due by J. Smith the fair sex. All descriptions are, but it is only the egg of the do-

mestic fowl that enters into general use. In some of the villages along the rocky portion of our coast, the sea-gulls hover in swarms about the ledges of the rocks, is for them a time of plenty; and there is danger and romance about the mode of their capture quite unknown to, or ever dreamed of, by the farmer, peasant or the servant of the commercial incubating establishments. Our home producers, as a class, are probably not much given to the study of figures, or they might be struck with the vastness of the importation of a demand that never relaxes, and a supply from abroad that continually increases—so much, indeed, that the egg merchants look upon the home source as a trifling in the scale in satisfying the wants of their customers. We have no accounts of the numbers brought to the markets of Leadenhall and Newgate, and only a rough estimate of a French authority, who gives the value of the poultry of the United Kingdom at less than one year's supply of eggs from abroad. Thus the annual import of eggs from the Continent averaged 73,000,000 from 1843 to 1847; it averaged 103,000,000 during the next five years, 147,000,000 for the next five years, and 163,000,000 for the next five years. In 1861 we received from abroad 203,313,360; in 1864, 335,298,249; and in 1866, 438,878,880, being in excess of one million a day, and valued at £1,097,197 sterling. These are facts that might well astonish the agricultural mind. The Royal Agricultural Society is evidently alive to their importance, for at the meeting for the Eastern Counties, to be held at Bury St. Edmunds in the present month, the fowling poultry was to form a prominent department. Prizes were offered for the best description of fowls, varying from 100 downwards. No similar inducements have been given by the Society since their show at Chester in the year 1858.

At the present time, although there is much attention devoted to the subject, it is principally confined to the fanciers, and upon the best description of birds, as the poultry, and their product, the egg, have not gained any general popularity amongst persons engaged in agriculture. Whether this arises from a disbelief in the possibilities of the occupation, or the difference between the tenure of the soil in England and that of France, from whence we derive our great supply, is a matter beyond our purpose to attempt any elucidation. We merely wish to place the facts before our readers, who are necessarily more interested in the sale than the production of articles. That much may be learned, both from the study of these facts and the mode in which the eggs are produced in France, we readily admit; and if the ventilation of this topic will aid in the increased supplies from at home, we shall have effected some good beyond the general reason of this journal. It is evident that more than one million sterling in value of eggs were landed on our shores that could have been raised with the greatest ease at home, and the question naturally arises, "How do foreigners thus take possession of our own markets, with all the disadvantage of having to convey a perishable cargo through the hands of shippers and commission agents, with all the risks and attendant expenses?" There has been no want of inducement in the matter of prices, for in the year 1864 the Custom-house computed the net value of eggs as low as 4s. 6d. per ten dozen; but during the last six years 6s. per 120 has been reckoned, which is also the wholesale price in France. Amongst the arrangements under the French treaty was the abolition of the duty charged on eggs. On August 8, 1864, there was a reduction to 4d. per 120, and from that time to March 6, 1860, they were entered by the cubic foot at the rate of 8d. This mode was found less convenient, and the previous system was adopted—that of number, called great hundreds, or 120, as a unit; and eggs were placed amongst free articles.

The countries from which we derive our principal supplies will be seen by the following table, with the exception of the year 1866, where the total alone has yet been ascertained:—

From	1862.	1863.	1864.	1865.	1866.
	gt. hunds.	gt. hunds.	gt. hunds.	gt. hunds.	gt. hunds.

Value	£593,813	£673,638	£835,028	£928,247	£1,097,197

In the volume of trade and navigation published by the Board of Trade, the average prices given for the computed value in the year 1865 were—Belgian 6s. 2d., French 5s. 11d., the Channel Islands (their own produce) 5s. 10d., and Spanish 6s. 3d. per great hundred. It would, however, be an erroneous impression to suppose that Belgian eggs were therefore worth more than French, the mode adopted by the authorities at the Custom-house being this: to take the average prices published in the *Economist* for that year as follows, per 120:—

January	s. d.	July	s. d.
February	7 6	August	5 7
March	7 4½	September	5 6½
April	5 9	October	8 9½
May	5 7½	November	7 8½
June	5 4½	December	8 7
	5 3		

and apply the same price to the imports of each month from all parts. The average price so applied varies from month to month, as will appear from the above quotations. Since the value attached to the importations for the entire year is the sum of the values of each month, it follows that the average value of the importations for the year varies for the several countries according to the month or months in which the bulk of those importations took place. The cargoes are shipped chiefly in steam vessels, and arrive at the ports of Southampton, London, Folkestone, Arundel, Newhaven, and Shoreham. Of the supplies from Ireland, in the absence of any positive data, it is generally supposed that they have diminished from that quarter.

The time for laying eggs takes place according to the temperature and the climate. They begin in France, and in most parts of Europe, from January to March, the forward hens laying in the earlier months, and the sluggish not until the latter. For purposes of preservation the late eggs are considered the best. April, May, and June are the months when the production is most abundant; but in July the laying slackens, to resume a certain degree of fresh activity in August and September. In October and November, which is the season of the moult, it ceases almost wholly, and is null in the month of December. To obtain eggs in this season artificial means are employed by raising the temperature of the houses, and some poulterers assert that a supply can be had in the winter by feeding the birds on buckwheat, which is then given whole, and upon meat. In parts of France where breeding is carried on as a trade, there is a separate class of persons called *coupeurs*, or hatchers. The hen is seldom allowed to lead the chickens after being hatched; the *coupeurs* entrust this office either to capons or turkeys, the hen being more valuable for laying eggs than rearing the brood. If a similar attention to the details were giving in this country, the stock of fowls which roam about the farmyard, and gather corn from the threshing, instead of being a mere adjunct and perquisite of the servants, would return sufficient to discharge the rental of many a small occupation. Such, we have understood, has been the case where the experiment has been fairly tried, and once this becomes an established notion our home supplies will increase in a greater ratio than they do at present. According to a competent

authority, at this time, what with improved native and imported varieties, we possess the best stock of egg-layers, hatchers, and table fowls in the world. In no country is the management of our best poultry-yards excelled. These should serve as a model for the rest; and, to bring up the wholesale results to their true national importance, all we require is an extension of the taste for bird-farming amongst those who earn their living on the land.

To show the seasons in which the laying is most active, and the variations that take place, we give the following figures from our import tables:—

	1867.	1865.	1866.
	Number.	Number.	Number.
January	6,999,000	13,301,000	16,386,000
February	17,851,000	22,323,000	25,794,000
March	31,848,000	32,531,000	46,537,000
April	39,930,000	48,507,000	51,471,000
May	38,177,000	37,890,000	52,334,000
June	35,332,000	36,488,000	36,476,000
July	34,549,000	34,279,000	40,565,000
August	29,711,000	28,444,000	33,818,000
September	19,547,000	24,056,000	26,917,000
October	15,864,000	20,424,000	20,694,000
November	27,836,000	23,103,000	31,018,000
December			

In connexion with this subject, we paid a visit to the National Poultry Company's establishment, which is within a short walk of the Bickley Station, on the South-Eastern Railway. This experiment in the production of poultry is the most important that has been made, and another is projected at Katern Bourn, Shenley, Herts, about fourteen miles from London. The plans for the houses at Bromley were made by Mr. Geyelin, but were not carried out to their original extent. The home, now under the management of Mr. Massey, consists of a principal building, sheds, houses, yards, &c., and market gardens occupying six acres of dry, gravelly soil. The main building is a greenhouse-looking erection, of wood and glass, 340 feet long, 20 feet broad, and 12 feet high to the central ridge. The pens are arranged along each side of the long central passage, which has a floor of red tiling, with shafts admitting cold air in summer and warm air in chill weather, ventilation being provided from above. The pens are in two tiers—that is, a ground-floor and a story, each occupying twelve feet of frontage, with a breadth of three feet from the wired front to a wall of boards, and outside the boards is a similar range of pens of the same size, having for their outside wall a framework of wood and wire. Thus, a cock and six hens have the range of an inner pen of 12 feet by 3 feet, completely shut in from the weather, and also of an outer pen of equal size, roofed, but exposed to the open air through wire of about two-inch mesh. This was thought to be rather close confinement for all of the most inactive breed of fowls, and therefore *perches* have been lately added to the building open run of about 30 feet square, in which the different *persons*, birds are permitted to exercise and scratch *traits*. When a hen wants to lay she creeps into a *guinea*, outside her pen in the central passage, and held. *Speci-* consists of a circular earthenware pan, 12 inches *office* of and 5 inches deep, containing some dry *office*. Scrupulous attention, of course, is paid to and to every detail of cleanliness in the vessels.

At one end of this building, which brood stock, are the departments hatching, and the apparatus sent Inspector, ap- the department for rabbits, the *Alkali Act*, has just the boiling-houses, pigstyes, &c. from which it appears of the premises. There were *made* in the manner of poultry on the premises; *all* *acid* during the pro- the season for laying, the *various salts*, the amount of eggs into baskets. *Thes*

of the hotels in town, but a great many are disposed of for the purpose of hatching, and are marked in pencil according to the different breeds. At present the Bromley Home is chiefly devoted to the breeding of what may be called "fancy" birds, and since the stocks are excellent, the diffusion of the best class of birds throughout the country will produce national benefits superior to the sale of mere quantities of eggs. The French varieties of Houdan, La Flèche, and Crevecoeur, are said to bear confinement, are hardy, good layers, and non-sitters, and they vary in prices from 15s. to 60s. each bird, and for eggs, per sitting of 13, from 15s. to 18s. If we might venture to offer a word of friendly advice to this and similar establishments, in which we take the liveliest interest, it would be to reduce the price of eggs. Those disposed of for domestic use are, we believe, rendered unfit for the purpose of sitting, and high prices act as a prohibition upon all such experiments. Although opinions amongst poulterers differ respecting the use of natural means for hatching, yet for the bad sitters the invention of the incubator may prove useful. Mr. Crook, who is a fancier, has by his firm in Carnaby-street, Regent-street, patented a very successful invention, to which we shall hereafter allude. In such undertakings as the Bromley Home we possess the source of supply. The arrangements for feeding, hatching, and fattening are open to visitors, and are interesting even to casual observers; for farmers, and others commercially affected, they should furnish examples for the proper and successful management of their own poultry-yards.

The increasing demand for eggs, although it has failed to elicit any corresponding or commensurate efforts in our own country, has not been lost upon our quick-witted and versatile neighbours across the Channel. The metropolis is almost wholly supplied from foreign sources, and new-laid eggs, as they are called, demand exorbitant prices, and only reach the tables of the well-to-do classes. Those who have the good fortune to accept the hospitalities of the farmhouse, in addition to the never-failing appetite on such occasions, will discover the superiority in this portion of the fare, and will gladly return with a contribution from the henhouse. The provincial towns, with trifling exceptions, monopolise the eggs from the surrounding neighbourhoods; the small farmers who do not sit the market sell their supply to the country shopkeepers, or give them in exchange for other articles. Many cottagers contrive to keep a few fowls, and where there is no pig these act as scavengers, consuming the scraps of the family, the outside cabbage-leaves, peelings of boiled potatoes, &c., and if supplied with a little corn, lay a great many eggs. There are no regular agents or dealers engaged in the trade, but the grocer or the butcher of the village takes the surplus at the usual market price, deducting his commission. The consumption of an ordinary household in the country is as much as 2,000 eggs per annum, so that the residue has no great effect upon the metropolis, nor the large manufacturing towns. Indeed, it is but egg-probable that the care of poultry has retrograded; years ago the small holdings have been absorbed by large ones, and many an active, frugal housewife has been with-
seems in our rural life who had the will and the means by the moving the market. Neither the cottager with-
sents so much (instead of his share in the village green portion of it) nor the artisan has range enough for pro-
the frugal and to advantage; therefore, in catering for
to mix on the wholesale merchant must occasionally
out the social fall visit to the markets in France, and
country in aid of the sight and activity of agents to meet

but it by whom it is carried on

in a vigorous and commercial manner, more especially in the provinces of Burgundy, Normandy, and Flanders. According to the latest agricultural returns furnished by the French Government, for 43 departments, a value of eggs and feathers produced each year was at 32,500,000 francs. This was considered to be under the mark, as the consumption of Paris alone is equivalent to 12,000,000 francs; and although, perhaps, it would be less in the provinces than at Paris, it can be fairly set at rather more than half as great. The eggs, which at Paris are worth 60 francs per 1,000, average 40 francs per 1,000 in the country. We can obtain a total of 100,000,000 francs, or, with the capital 142,000,000 francs (£5,680,000), as the annual value of French eggs. At this rate the consumption amounts to 2s. per head of the whole population. One of the French writers on this subject gives 7,000,000 eggs as the annual produce; and if we average 60 eggs as the number that each hen would lay, there would be at least 117,000,000 fowls, and these, at 3 francs apiece, would give £14,625,000 sterling as the value of the poultry stock of France. For the past year, on the same rate of 60 per head, the eggs imported into this country present the laying of no less than 7,300,000 eggs.

From a pamphlet published by M. de la Fosse, Goussainville, near Houdan, we select a few statistics of the trade in that immediate neighbourhood, which will give a correct idea of its importance. At the markets of Houdan, Dreux, and Nogent le Roi, there are annually upwards of 8,000,000 head of fat poultry, viz. :—

	Per Week.	Per Month.	Per Year.
Houdan	40,000	160,000	1,220,000
Dreux	50,000	200,000	2,400,000
Nogent le Roi	35,000	140,000	1,530,000
Total	6,000,000

This does not include the sale of chickens, poultry, and eggs, which forms a separate trade. Every village says an eye-witness, has its weekly markets, where farmers and their wives bring their produce for sale, with preference to selling at the farmyard. The police regulations in the markets are strictly enforced. The various products are classified before the market begins. Each person is bound to keep his assigned place, and not allowed even to uncover his goods, much less to sell before the bell rings, under the fine of 5 francs. At the ringing of the bell, the bustle to uncover, the rush of buyers, and the chattering, are worth while to witness. The dealers and merchants take up their stand outside the market, where they send all the products they purchase. The seller has a ticket given him, with the purchase price on it, and is paid on delivery of the goods at the dealer's stand. It seems almost incredible that even in some village markets, within two hours, such a vast amount of business can be transacted, with the greatest order and decorum. Some merchants will purchase from 2,000 to 3,000 pounds of butter; others 20,000 to 30,000 eggs, or 1,000 heads of poultry, &c., all which are taken to their warehouse to be sorted, packed, and perhaps forwarded the same day to London or Paris. The current price for every commodity is fixed and known immediately after the market opens, and depends entirely on the demand and supply. At the wholesale poultry market, La Vallée, in Paris, where the poultry, dead or alive, is forwarded from all parts of France, there are a number of licensed agents, who sell by auction to the highest bidder; this market is a curious scene from four till nine in the morning, when thousands of crates of all descriptions of poultry are cleared out and disposed of.

The eggs are sold in the markets of Paris in baskets which ought to contain 1,040 good valuable eggs. They are counted, at the wish of the buyer, by the official agent, who verifies the *déchet*, or loss; also the size, by passing them through a ring. For such there are charges for

per *mil* for counting, 60 cents per *mil* for export, and 15 cents for passing the ring; besides charges there are the duties collected by the Municipality of Paris. The production of eggs in France is, in point, unlimited; and the attention of breeders is drawn to the improvement of the breed by additions, and modes of preservation also for voyages. In consequence of the success which had attended the exhibition of the poultry of La Bresse (in 1854), a stir was created, and on the representation made to him, the Minister of Agriculture instituted an international show for fat poultry at Paris. The fowls were divided into five classes—La Bresse, Houdan, La Flèche, Normandy, and all other breeds. La Bresse he led, gaining, after a struggle with La Flèche, the gold medal for the best fowls of any class. Much success was due to the strenuous exertions of Count de Montebello, as no region had greater difficulties to surmount than La Bresse, which constitutes the *arrondissement* of Jura; in the department of Ain, and extends from the mouth of the Saône eastward to the spurs of the Jura. Fowls have certain features to distinguish them, and in the beginning of lay in February, and for a month or two, the hen lays daily, then three or four times a week, and she has laid about 160 eggs, besides rearing two or three broods. On every farm poultry is fattened to a certain extent, and until lately was little known or appreciated at Paris, though for 40 years it has been exported to Petersburg.

The prices of eggs per 1,000 have been at different periods as follows in the Paris market:—

1804	fr. 48	1850	fr. 43.79
1826	64.50	1852	45.32
1845	48.74	1853	50.19
1846	50.27	1856	60

The consumption had risen from 74,000,000 in 1807, to 4,000,000 in 1853. These are collected from ten or twelve departments which encircle the city, but more than half is furnished by Le Calvados, L'Orne, and the Maine. From the latter and the Pas de Calais are derived the English supplies. Around Houdan are the *gees* of Goussainville, de St. Lubin, and La Haye. Near La Flèche au Mans are Villaine and Boce; also the hamlets near St. Pierre Dive, Lisieux, Calvados, Beauvais in the Somme—all localities abounding in poultry. The ports at which the greatest amount of poultry takes place are Calais, Cherbourg, and Honfleur; Calais the eggs are packed in cases with straw, 1,100 the case; and at Cherbourg and Honfleur in cases of 1,200.

The total value of exported eggs, of which England has secured the lion's share, has been as follows:—

1815 to 1855, an average of ..	fr. 2,786,000
For 1850 ..	7,512,000
" 1858 ..	10,418,000
" 1859 ..	11,340,000
" 1861 ..	17,845,000
" 1864 ..	27,974,000
" 1865 ..	37,650,000
" 1866 ..	42,334,000

Now these exports have been distributed will appear by the table:—

	1864.	1865.	1866.
	kilog.	kilog.	kilog.
Belgium	46,384	84,107	130,627
United Kingdom	22,096,262	29,765,361	33,458,639
Germany	15,767	35,713	
Spain	34,789	52,632	
Italy	14,799	16,117	
Netherlands	143,200	133,763	278,659
United States	2,196	3,370	
Other countries	27,120	29,719	
Total	22,379,457	30,120,772	33,867,825

As a general definition, the districts that grow buckwheat produce the greatest abundance of eggs; and if we would prosecute this matter successfully at home, it would be well to ascertain whether buckwheat cannot be imported to any considerable extent at a cheap rate. Upon the quality and description of food egg-laying much depends.

From a review of these facts, it will be apparent how much our neighbours, the French, have accomplished; an export of one million sterling per annum in eggs is no insignificant item even in the balance-sheet of a nation. We have entered upon this subject of foreign supply as fully as the public returns and the sources of information, private and otherwise, would enable us, since we have felt its importance to our readers, especially as retailers, and also its indirect bearing upon producers. Many of the former must visit the capital city of France during the unusual attractions of this year, and they may be induced to diverge from the ordinary route. By a personal knowledge of the egg districts named, they will learn, better than by any descriptions we can give, how our admirable and talented rivals in commerce have acquired superiority in this department of business, and exemplified the saying of the great artist, and whilst imparting which maxim he probably gave to his pupils the secret to his own fame, "that by attention to trifles it is possible to arrive at perfection."

Fine Arts.

REMBRANDT ETCHINGS AND DRAWINGS.—A large and choice collection of these works is now on view at the Burlington Fine Arts Club, Piccadilly. Among other valuable etchings may be seen that of "Christ Healing the Sick," commonly known as "The Hundred Guilder." Of the five copies exhibited of this masterpiece by Rembrandt, displaying different stages in the plate, the greatest interest naturally attaches to that which in the recent sale of Sir Charles Price's collection fetched the unprecedented sum of £1,150. This work, which can be traced in an unbroken pedigree from Rembrandt himself, is lent by its present possessor, Mr. C. J. Palmer. The student of the great master of the art of etching will find examples of each distinctive class, such as landscape, portrait, sacred history, &c. The collection also contains some rare Rembrandt drawings. Among the well-known collectors represented may be mentioned Holford, Felix Slade, Seymour Haden, Fisher, Morrison, Palmer, Baron Marochetti, the Duc d'Anmale, &c.

NATIONAL PORTRAIT EXHIBITION.—Photographs have been taken of these portraits, in illustration of the official catalogue. The catalogue contains biographical and historical notices, together with an introduction by Mr. Samuel Redgrave to the exhibition and the art of portrait painting generally. About eight hundred photographs have been taken, with the consent of the owners, out of a collection numbering 866 works. The entire series has been distributed in eight volumes, and the cost of the whole, bound in half morocco, is £50. Any person, however, may select for himself a volume of 100 portraits for six guineas, or a packet of sixteen for one guinea. A single photograph can be purchased for 1s. 6d. Specimens may be seen in the exhibition, or at the office of the Arundel Society, Old Bond-street.

Manufactures.

ALKALI WORKS.—The Government Inspector, appointed under the provisions of the Alkali Act, has just presented his report for 1866, from which it appears that a further advance has been made in the manner of preventing the escape of muriatic acid during the processes of manufacture of various salts, the amount of

escape last year being 0.78, against 0.88 of the preceding year. This improvement, small though it be in apparent amount, is a real benefit to the residents in the neighbourhood of chemical manufactures, as the difference of 0.15 represents more than 15 cwt. of muriatic acid per diem, or 44 tons per week. The condensation of the dangerous acid is thus shown to be generally satisfactory, although some allowance must be still made for leakage, which it is difficult to estimate, and which it requires increased vigilance, and possibly an amendment of the Act, to prevent. The manufacture of chemical salts appears to be still increasing, the amount of salt decomposed during the first year of inspection having been 288,000 tons, in the second 310,000 tons, and during the third (1866) 371,960 tons. The report adds:—"It is possible to do a little more by careful management of the powers granted by the Act, chiefly by giving permanence to the habits begun, and giving stability to work which had been hastily done to meet the exigencies of the occasion, although impossible to use the Act so as to satisfy all the demands of the public when the works are in a very crowded district. The inspector can duly see that the proper arrangements are made, and that they are in order when he makes his visits. At all other periods he must leave the public to watch." Only one case (at St. Helen's) was heard during the year as legally an infringement of the Alkali Act. Several cases of escape of more than 5 per cent. have resulted in immediate alteration on representation. The following is the report on the alkali trade of the Tyne, signed by Mr. Richard Cail, hon. secretary Tyne branch, and embodied in the inspector's report:—

FEBRUARY, 1867.

Statistical report of the alkali trade of the Tyne branch, comprising all the manufacturers on the Tyne, and one firm having part of their works at Glasgow, which is included in the following figures, to the extent of 93 per cent. from actual returns, leaving only 7 per cent. to be computed where no return has been made, the salt decomposed being 151,700 tons.

QUANTITIES OF THE PRINCIPAL ARTICLES MANUFACTURED BY THE TYNE BRANCH IN ONE YEAR.

	Tons.	2	s.	2
Soda crystals	86,000	at	5 10	473,000
Soda ash and alkali	74,000	at	11 0	814,000
Bi-carbonate of soda	11,000	at	18 0	198,000
Sulphate of soda	2,400	at	4 5	10,200
Bleaching powder	27,000	at	14 0	278,000
Epsom salts	590	at	8 0	4,720
Caustic soda 70 per cent.	3,720	at	26 0	96,720
Glauber salts	20	at	6 15	135
Oil of vitriol for sale	9,000	at	4 0	36,000
Sulphate of copper	200	at	26 0	5,200
Muriatic acid	700	at	3 0	2,100
Hypo-sulphite of soda ..	400	at	18 0	7,200
Chloride of manganese ..	1,300	at	3 10	4,560

Total tons .. 216,330 Value £1,929,825

Computation of the principal materials used in the manufacture of the above articles by the Tyne branch for one year, in order to show the employment given to shipping, &c., as follows:—Salt, pyrites, chalk, cliff, manganese, nitrate of soda, timber (for packages), giving employment to shipping, as follows:—

Inwards, to the extent of	466,000 tons.
Outwards (manufactured goods)	264,000 "

Together..... 730,000 tons.

Coals (a small quantity of which are carried by shipping)	340,000 "
---	-----------

Total materials carried by sea and rail 1,070,000

The above amount of 1,070,000 tons of raw material is of the value of £830,925, and exclusive of all materials

used for buildings, plant, and repairs; which latter, from the nature of the acids and gases employed, cause rapid destruction, and occasion constant rebuilding and renewal.

SUMMARY.—TYNE BRANCH.

Value of raw material.....	£730,925
Tons weight of manufactured goods....	215,930
Computed value	£1,929,825
Tons weight per carriage by sea and rail	1,070,000

The inspector observes hereon, that if the same proportion is carried out elsewhere as on the Tyne, the total annual value of the alkali manufactures will be £4,750,000.

Commerce.

COMMERCE IN NEW CALEDONIA.—A paragraph in a recent number of the *New Zealand Herald* calls attention to the progress that is being made in New Caledonia between which and Auckland a regular trade seems likely to spring into activity. It will be remembered that New Caledonia, first discovered by Captain Cook in the year 1772, and more fully explored subsequently by the French traveller d'Entrecasteaux, is one of the most considerable islands in the South Pacific, and repeated attempts have of late years been made by the French Government to render it a permanent settlement. Great difficulties, however, would seem to be in the way of its advance, as it is upwards of eight hundred miles distant by sea from the nearest point of the Australian mainland, and nine hundred from New Zealand. It is about two hundred miles long by twenty-five broad, and is situated between the parallels of 20° and 23°, crossed by the meridian of 165° east of Greenwich. Any commercial importance that it might have with regard to England, would arise chiefly from its connection with the line of communication between India and the Australian colonies by way of Torres Straits, which separate New Guinea from the Australian mainland. "A fair sample of threshed rice," says the *New Zealand Herald*, "has recently arrived in Auckland from New Caledonia, which produces also coffee, sugar, cotton, and tropical fruits. We are informed that the winter is somewhat like our summer, only with more frequent rains, while the summer weather, though much hotter, is not, as might be supposed, oppressively so. The island being a long and narrow one, there is constantly a sea breeze passing over it. Extreme drought is unknown. As many as three crops of rice are taken from the same ground in the same year, the first crop only being sown, the second and third springing from the stems of the preceding one. Of maize, too, we are informed, the cultivator may take two crops in the year off the same field, or five crops in two years, though for this crop of course the land must be cultivated and planted each time. The land, we are told, is very rich, and is easily procurable from the Government. The price is 8s. per acre, but the Government will allow emigrants to take up land on five years' credit, paying meanwhile a rent at the rate of 6 per cent. per annum on the cost. As the land produces at once, and the cultivation of it is easy, men used to labour, and with only a small capital sufficient to furnish provisions for the first eight or ten months, cannot, says our informant, fail of success. Much of the land, which is for the most part open or untimbered, is covered with rich grass, and ready at once for pasturage. The coffee plant not long since was in full berry, and so heavy, we are told, was the crop that the shrubs were literally bowed down to the ground, unable to sustain the fruit. The natives, if at times troublesome, are dealt with by natives and in French fashion. There is no interference of a Parisian Aborigines' Protection Society. Englishmen, and all foreigners indeed, are placed on the same footing as French residents—with this exception, that they are ineligible to hold Government appointments."

Colonies.

AUSTRALIAN MINERAL STATISTICS.—The mineral statistics of the colony of Victoria for 1866, as compiled by the officers of the Mining Department, comprise a great mass of information, especially regarding the condition of the gold-fields. The first subject touched upon is that of mining for gold. A large decrease in the number of miners is noticed. In 1865 the mean number of miners employed throughout the year was 83,214, and last year it was 73,577, showing a decrease of 9,637. There is a decrease in the mean number of alluvial miners of 7,592, and of quartz miners of 2,045. On the 31st December, 1866, the numbers were—alluvial miners, 55,916; quartz miners, 14,878. As regards the separate divisions the numbers stand thus: Of alluvial miners there is an increase of 217 at Ballarat division, a decrease of 288 at Beechworth, an increase of 56 at Sandhurst, a decrease of 2,260 at Maryborough, a decrease of 4,096 at Castlemaine, and an increase of 135 at Ararat. Of quartz miners there is a decrease of 1,196 at Ballarat, a decrease of 1,676 at Beechworth, an increase of 242 at Sandhurst, a decrease of 165 at Maryborough, an increase of 283 at Castlemaine, and an increase of 64 at Ararat. The total number of Chinese miners in the colony on the 31st December, 1866, was 20,134, of whom all but 34 were engaged in alluvial mining. It is not easy to enumerate these people, and it is not believed that any large decrease has taken place in their numbers as compared with 1865. The average earnings per man per annum, without distinction of classes, has been £80 8s. 3d. This amount, as compared with previous years, is large, and may be accounted for partly by the aid which the miner derives from machinery and partly from the facilities afforded him of operating on new and rich quartz-reefs, which day after day are discovered by the prospector. A table of the average earnings per man since 1860 shows that at that period they amounted to £79 9s. 3d., that they declined in 1862 to £67 17s. 10d., and that since then they have progressively increased to their present figure. The average earnings in 1866 of alluvial and quartz miners respectively are given—for the former £66 4s. 1d., for the latter £132 17s. 4½d. These figures must not be regarded as absolutely correct, minute accuracy being impossible. The increase in the number of steam engines employed is not large; the number engaged in alluvial mining being 480, with an aggregate horse-power of 9,981, as compared with 473, of 8,208 aggregate horse-power, in 1865. Those employed in quartz-mining number 510, of 9,231 horse-power, and working 5,437 stamp-heads. The total value of the machinery is £2,068,527, being nearly double of that in use in 1859. The largest value is in the district of Ballarat, which is set down at £743,683. The number of distinct quartz reefs is 2,282, and there are 869 square miles of auriferous grounds, which have been worked more or less since the first discovery of the gold-fields. A great extent of known auriferous country still remains worked only here and there by small parties of miners. At the end of the year 76,546 acres of land were held as claims under the bye-laws, but the whole of this area was not being worked, 20,778 acres being protected by registration or exemption certificates. Comparing the number of men employed on some of the lands held under lease, they amount to 3,796, as against 6,487, which should be employed by the covenant of the leases. The value of all the "claims" throughout the country, as arrived at by a careful estimate, is £8,987,067, as against £8,498,924, the estimate for 1865. The returns of quartz crushed show an average of 10dwt. 16½gr. per ton. In 1865 the average was 11dwt. 17½gr. per ton. The returns from 1859 to 1866 give an average of 11dwt. 22-80gr. per ton. The average yield of gold per ton in the Beechworth district is very high, 18dwt. 3-7gr.; in the Ballarat district very low, 4dwt. 21gr. The average per ton from 145,088 tons of quartz-tailings, cement, mullock, &c., has been 4dwt. 6-43gr. The prices for

crushing quartz, &c., ranged from 4s. to \$1 10s. per ton. There has been a considerable increase in the number of races constructed. There are at the present time 2,249 miles of races in the colony made exclusively for mining purposes, and they have cost £319,934, or £141 6s. 3d. per mile. There were 94 water-right licenses for gold-mining purposes in force, for 264 miles of races and 298 acres of reservoirs. The quantity of water to be diverted per diem was 123,562,300 gallons, and the reservoirs were estimated to contain 227,515,552 gallons. The number of miners' rights for one year issued in 1866 was 46,637; only 19 were issued for a term of two years, 2 for three years, 23 for four years, and 1 for 15 years. Of consolidated rights, 283, representing 7,825 single rights, were issued. A summary of the mining companies registered to the end of 1866 shows the number to be 1,982, the number of shares 5,702,243, nominal capital £19,477,911. Ballarat stands at the head of the list, for £7,904,986, and Beechworth next for £5,239,925. Passing to other metals and minerals, the quantities raised during the year are said not to be large. Of silver ores 2,139 tons were raised, and 2,348 oz. of silver smelted; of black sand (mostly oxide of tin), 92 tons, of copper ores, 350 tons, of flagging, 10,400 square yards and 60 tons, of slate, 82 tons, and of magnesite, 6½ tons. One diamond was found at Eldorado, near Beechworth. A summary of the value of metals and minerals raised in the colony from the first discovery of the gold-fields to the end of 1866 gives the value of gold obtained at £129,909,063, silver, £3,441, tin, £185,537, copper, £3,494, antimony, £27,978, coal, £2,899, kaolin, £7,028, flagging, £13,938, besides minor items; the total of mineral produce for that period being £130,154,332.

Notes.

INTERNATIONAL LITERARY CONGRESS, PARIS.—It has already been mentioned that the Société des Gens de Lettres, of Paris, intended to take advantage of the presence of the large number of visitors attracted by the Exhibition this year, to hold an international congress, with the view of discussing those subjects which interest men of letters in all parts of the world. The proposition has been well received, and the Minister of the Interior has, it is said, granted the society a subsidy of 10,000 francs towards the expenses.

SCIENTIFIC ASSOCIATION OF FRANCE.—This association, established by the Imperial astronomer, M. de Verrier, and the meetings of which are held at the Observatory of Paris, has grown rapidly into importance. It appears, by a report just issued, that it has already applied the sum of 78,000 francs in aid of important scientific experiments, and has, moreover, made a reserve of 17,000 francs for the general purposes of the association. The association now announces its intention of publishing its *Bulletin* weekly instead of monthly, as at present, and including in it notices of all scientific discoveries, accounts of new inventions, criticisms on scientific and other works, &c., and has issued the first number of the new series.

Correspondence.

PARIS EXHIBITION.—SIR,—We shall feel obliged by your early correction of an error in your published list of the recipients of the Silver Medal in Class 44 of the Paris Exhibition. The medal was awarded to Morson and Son, and not "Mawson," as printed in your *Journal* of the 5th inst. This is of some importance to us, as there is a chemical manufacturer of the latter name.—Yours, &c., T. MORSON AND SONS.
31, 33, and 124, Southampton-row, Russell-square, W.C.,
8th July, 1887.

Messrs. Schooling and Co., of North-side, Bethnal-green, also write to say that they obtained a Bronze Medal in Class 72.

Journal of the Society of Arts.

FRIDAY, JULY 19, 1867.

Announcements by the Council.

SOCIETY'S VISIT TO THE PARIS EXHIBITION.

The period fixed for the visit is from Monday, the 29th of July, to Friday, the 16th of August, so as to include the Napoleon fêtes. A reception-room has been provided for the use of the members during their stay, where their correspondence may be addressed, and where they will have the convenience of writing letters, making appointments with their friends, and where notices of all arrangements for visits to various places will be suspended. Lists of hotels and apartments will also be provided there for consultation.

The announcement of the intended visit has been received with much cordiality by the French authorities, manufacturers, and others, who have expressed their readiness to aid the Society in every possible way.

The Minister of Public Instruction has most kindly granted special permission to the members of the Society to visit the University and Lycées of Paris. The Prefect of the Seine has obligingly promised that the necessary orders shall be transmitted to the Society to enable the members to visit the catacombs, the sewers, and the municipal establishments. M. Belgrand, the inspector-general of the water service of the City of Paris, has given instructions that the great Reservoir at Ménilmontant shall be open to the members for a week. The Director of the Imperial Observatory has given instructions to admit the members to that establishment. The Director of the Mint has in like manner authorized the visits of the members to that establishment on two days in the week. The Director of Roads and Promenades of Paris has given permission to visit the Horticultural and other Municipal establishments; and M. Le Play, the commissaire-general of the Exhibition, has kindly offered to do all in his power to assist the views of the Society.

The members will be admitted to some of the most interesting and important private establishments in Paris. Amongst the firms that have at present expressed their willingness to receive the visits of the Society, may be mentioned those of MM. Oail and Cie., engineers; Lahure, and Chaix and Cie., printers; Mazaroz Tibaillier and Cie., furniture manufacturers; Lachette and Cie., publishers; and Barbédienne, artistic bronze manufacturer. All these gentlemen have responded promptly and fully to the

applications made on the part of the Society, but, of course, there are times and regulations to be observed with respect to visits, which will be duly communicated to the members.

A programme is in the course of preparation, which, with a card of membership, will be forwarded to those members who have applied for them, in the course of next week. Any other members contemplating visiting Paris at this time are requested to send in their names to the Secretary immediately.

ARTIZANS' VISITS TO PARIS.

Her Majesty's Government have granted to the Society of Arts, in aid of the fund now being raised by the Society for assisting workmen, specially selected from various trades, to visit and report on the Paris Exhibition, the sum of £500, conditional on the Society raising a like amount by public subscription.

The following is the list of subscriptions up to the present date:—

H.R.H. THE PRINCE OF WALES, President ..	£31	10	0
HER MAJESTY'S GOVERNMENT (conditional) ..	500	0	0

PROGRAMME OF EXAMINATIONS FOR 1868.

PRELIMINARY NOTICE.

I. The Examinations described herein have been established for the benefit of the members and students of Institutions in Union with the Society of Arts. Such persons are commonly mechanics, artisans, soldiers,* labourers, clerks, tradesmen and farmers in a small way of business, apprentices, sons and daughters of tradesmen and farmers, assistants in shops, and others, of various occupations, who are not graduates, undergraduates, nor students of a University, nor following nor intending to follow a learned profession, nor enjoying nor having enjoyed a liberal education. To all such members and students in the Institutions, and to other persons of the like condition, male and female, the Examinations, certificates, and prizes, described in this programme, are open on the general conditions stated herein. Persons, however, who are, or have been, professional teachers or pupil teachers; persons who either are enjoying or have enjoyed a liberal education, or who occupy a higher position in society than those above described, may obtain certificates, but cannot compete for the prizes, of which particulars are given at pages 565 and 566.

II. The certificates are not competed for. They are

* The following circular memorandum (Gen. No. 331), addressed to the army at home, has been issued:—"Miscellaneous 1 (1865).—The Field Marshal Commanding-in-Chief desires it to be notified that there will be no objection to soldiers, their wives, and families, being permitted to present themselves for instruction and examination at the Educational Institutes in connection with the Society of Arts, on the understanding that they are not on that account to be exempt from any military duty, nor, except in special cases, to be out of barracks after watch-setting or tattoo.—By command of His Royal Highness the Field Marshal Commanding-in-Chief, JAMES YORKES SCARLETT, Adj. Gen.—Horse Guards, S.W., 11th March, 1866."

Subscriptions may be forwarded to the Financial Officer, at the Society's House.

The Council are now prepared to receive the names of any workmen recommended by their respective trades as fit and proper persons to undertake this important duty on behalf of their fellow workmen.

awarded as records of positive, not comparative, attainment. The prizes are competed for.

III. For the conditions on which persons of a higher grade in society may be examined and receive certificates, but not compete for prizes, see paragraph 4 (D).

IV. The Candidates for Examination have not to go to a distance from their homes. The Examinations are held in all places in the United Kingdom where a Local Educational Board connected with the Society of Arts is willing to make the requisite arrangements.

V. For a list of the Local Boards already formed, see page 566.

VI. For instructions as to the formation of Local Boards and their duties, see page 569.

The EXAMINATIONS are—

- (1.) The Previous Examinations by District Unions and Local Boards for ascertaining the fitness of Candidates to present themselves at the Final Examination.
- (2.) The Final Examination by the Society of Arts Board of Examiners, under the supervision of the Local Boards.

PREVIOUS EXAMINATIONS BY DISTRICT UNIONS AND LOCAL BOARDS.

1. The object of these Examinations is to " sift " the Candidates for the Final Examinations, so as to keep back (1) those who are not fairly grounded in the elements of education—spelling, writing, and arithmetic—and (2) those who are not fairly acquainted with the subject or subjects in which they desire to be examined by the Society of Arts, and are therefore unlikely to succeed in

that Examination. The sifting in the above-named elementary subjects may be effected at the discretion of the Local Boards; they should examine their Candidates in spelling and writing by dictating to them a passage from an English author for them to write down; in arithmetic by setting them moderately easy questions to work out in the usual manner. The best mode of sifting the Candidates in the special subjects in which they desire to be examined by the Society of Arts is for the Local Boards to examine them therein by means of printed (or written) questions and written answers; but, where a Local Board finds itself without the means of conveniently holding such an Examination in any special subject, such Board may satisfy itself in any other mode, and state simply that it has satisfied itself, that the Candidate is fit to be examined by the Central Board in that subject.

2. The Previous Examinations must be held sufficiently early in the year to enable the proper returns to be made, as explained in par. 6.

FINAL EXAMINATION BY THE SOCIETY OF ARTS.

3. No Candidate can be admitted to the Final Examination unless duly returned by a District Union or Local Board as having passed a Previous Examination.

4. Every admitted Candidate must be at least 16 years of age.

(A.) Members of, or students of classes in, Institutions in Union with the Society of Arts, are examined Free.

(B.) Members of, or students of classes in, Small Institutions,* not in Union with the Society of Arts, but subscribing one guinea a year for admission to the Examinations alone, are examined Free.

(C.) Members of, or students of classes in, "Small Institutions"* not in Union with the Society of Arts, but connected with it through a District Union or Local Board, are examined on payment of a fee of 2s. 6d.

N.B.—It will be understood that Candidates coming under the heads (A), (B), or (C) must not be of a higher class in society than those described in par. I. of the Preliminary Notice.

(D.) Persons of a higher class of society than those described in paragraph I. (Preliminary Notice), cannot compete for prizes, but may be examined for certificates on payment of a fee of 5s.

5. The Council in every case require the Local Boards to certify whether a Candidate should pay this higher fee; and it is earnestly hoped that in any instance where a Local Board has reason to believe that a Candidate is or has been a teacher, or that he or his parents occupy such a position in society, or are in such easy pecuniary circumstances as to disqualify him, according to the regulations, for competing for a prize, they will at once, in case of certainty, return him as not competing for a prize, or in case of doubt, communicate with the Secretary of the Society of Arts.

6. A copy of Form No. 2 will be forwarded to the Secretary of each Local Board, and must be filled up and returned to the Secretary of the Society of Arts before the 12th of March. The requisite number of forms No. 1 will then be forwarded, and these, when filled up, must be returned not later than the 30th of March. Each of these forms, when returned, will be numbered at the office of the Society of Arts, and a card or each candidate, with his name and his number, will afterwards be forwarded to the Secretary of the Local Board for distribution, together with copies of the timetable.

7. The printed papers of questions in the various subjects will be afterwards forwarded to the Secretary of the

* Small Institutions are defined as those which have an income of less than £75 a year.

Local Board; details as to the mode in which the Final Examination is to be conducted are contained in the Letter of Instructions (Form No. 6), and members of the Local Boards should make themselves thoroughly acquainted with them.

8. When the Candidates' papers have been submitted to the judgment of the Society's Examiners, certificates of three grades will be awarded, and the names of the Candidates who obtain prizes and certificates will be afterwards published in the *Journal of the Society of Arts*.

9. A Candidate who has obtained from the Society a certificate of the 1st class in any subject cannot again be examined in the same subject; but a Candidate who has obtained a certificate of the 2nd or 3rd class may, on the recommendation of the Local Board, be examined in the same subject, in a subsequent year, without again passing the Previous Examination.

10. A Candidate who, having obtained a certificate in any subject, desires to be examined in some other subject, in a subsequent year, may be "passed" by the Local Board, after an examination in that subject, without re-examination in the elementary subjects; but, in all cases, the name must be returned in the proper form.

11. Particulars of the subjects for the Final Examination are given below.

12. The Time-table has been drawn up to meet the general convenience of the Candidates; and no variation of it can possibly be allowed, so that, in choosing the subjects in which they desire to be examined, Candidates must take notice of the arrangements of this Time-table, as they cannot be examined in two subjects which are set down for the same evening. The days and hours of Examination must be strictly adhered to.

13. The Examiners will reject all ill-written, ill-spelt, ill-composed, or ungrammatical papers that may be laid before them.

TIME-TABLE FOR 1868.

TUESDAY, 21st April, From 7 to 10 p.m.	WEDNESDAY, 22nd April, From 7 to 10 p.m.	THURSDAY, 23rd April, From 7 to 10 p.m.	FRIDAY, 24th April, From 7 to 10 p.m.
Arithmetic. Trigonometry. Electricity and Magnetism. Light and Heat. Mining and Metallurgy. Geometrical Drawing. German. Floriculture.	Book-keeping. Navigation. Conic Sections. Chemistry. Music. Domestic Economy. English History. Italian.	Algebra. Practical Mechanics. Animal Physiology. Political and Social Economy. French. † English Literature. Fruit and Vegetable Culture. Freshand Drawing.	Geometry. Mensuration. Principles of Mechanics. Botany. Geography. Latin. Logic and Mental Science. Spanish.

† Two papers of one hour and a half each in this subject are considered as one.

LOCAL EDUCATIONAL BOARDS.

14. Local Boards may be formed wherever the managers of Institutions, or other persons, may be prepared to co-operate with the Society of Arts.

15. Each Local Board must consist of at least three members, and must have a Chairman and a Secretary. The district for which the Board is to act should be defined, and the composition of the Board must be such as to command the respect and confidence of the neighbourhood. No member or officer of a Local Board can be admitted to examination.

16. The duties of the Local Boards may be defined as follows:—

(A.) To give publicity to the system of Examinations by the circulation of the programmes, hand-bills, &c. (copies of which will be furnished gratis on application), and to give encouragement and advice to those young persons who are likely to become candidates.

(B.) To hold the Previous Examinations.

(C.) To superintend the Final Examinations.

17. Local Boards make no payment to the Society, unless they exercise the power of admitting candidates who are not members of any Institution in Union with the Society of Arts (see par 4 C.); in which case a subscription of one guinea a year must be paid.

18. A detailed list of each Local Board (giving the exact address of the Secretary) must be submitted to the Council of the Society of Arts before the 1st of February, 1868, when the general list of such Boards will be published; and where a Local Board comprises so large a district that, for the convenience of the candidates, Branch Local Boards have to be formed, lists of these must also be given. All changes in the composition of the Boards must be notified to the Society of Arts.

19. N.B.—Local Boards may also usefully direct their attention to the holding of Preparatory Examinations in Elementary Subjects, either upon the system described at page 16, or upon any other system that they may prefer.

SUBJECTS FOR THE FINAL EXAMINATION IN 1868.

20. In the following paragraphs will be found brief outlines of the subjects in which candidates may be examined, and their attention is especially drawn to this part of the Programme. In many instances the Examiner has set down certain Text-books; but, in most cases, a candidate may exercise his own judgment as to what Text-book he uses; real knowledge, however or wherever acquired, will be accepted by the Examiners. In the following subjects, however, Political Economy, English History, English Literature, Logic, Latin and Roman History, French, German, Italian, and Spanish, the course of study is necessarily prescribed with more or less exactness.

I.—ARITHMETIC.

Examiner.—Rev. Alexander Wilson, M.A., National Society, London.

21. Practice—Simple and Compound Proportion—Interest—Discount—Insurance—Vulgar and Decimal Fractions; with the principles of a Decimal Notation in money on the basis of the pound unit.

22. The questions framed from the preceding syllabus will consist mainly of practical problems, and the Examiner will take into account not only the correctness of the answers, but also the excellence of the methods by which they are worked out, and the clearness and neatness of the working, which must always be shown.

23. Text Books:—Any of the modern treatises on Arithmetic, such as Hunter's Text Book (*National Society*), Colenso (*Longmans*), or Barnard Smith (*Macmillan*).

II.—BOOK-KEEPING BY DOUBLE ENTRY.

Examiners.—John Ball, Esq., of the firm of Messrs. Quilter and Ball, and Robert G. C. Hamilton, Esq., Principal Accountant to the Committee of Council on Education.

24. Candidates should be prepared to answer questions as to the nature and use of the different books usually kept in a merchant's office; to journalise a series of transactions from a waste book, and having posted the entries to the ledger, to balance the accounts, to prove the correctness of the postings by a trial balance, and finally to exhibit an account of profit and loss, and a balance sheet.

25. Text Books:—*Rudimentary Book-keeping* (*Weale's Series*). *Kelly's Elements of Book-keeping* (*Simpkins and Co.*). *Examination-Questions in Book-keeping by Double Entry*, by the Rev. J. Hunter, M.A. (*Longmans*).

III.—ALGEBRA.

Examiner.—Rev. T. P. Hudson, M.A., Fellow and Tutor of Trinity College, Cambridge.

26. Elementary Operations and Fractions, Simple and Quadratic Equations and Problems leading to them. Involution and Evolution. Simple Arithmetical, Geo-

metrical, and Harmonic Series. Combinations and Permutations. Binomial Theorem. Scales of Notation. Interest and Annuities. Elementary Theory of Probabilities.

27. Text Books:—*Todhunter's Algebra* (*Macmillan*), *Colenso's Algebra* (*Longmans*), *Lund's* or any other modern treatise on Algebra.

IV.—GEOMETRY.

Examiner.—Rev. B. Morgan Cowie, M.A., Professor of Geometry at Gresham College; one of H.M. Inspectors of Schools.

28. To obtain a first-class certificate, at least six problems and four propositions must be correctly done; to obtain a second-class, at least four problems and six propositions.

29. Text Books:—*Euclid*, Books I., II., III., IV., VI., XI., as far as Prop. 21. *Potts's* smaller edition (*Parker*). *Green's Euclid's Plane Geometry*, practically applied, is a useful help to those who are studying by themselves (*Heywood, Manchester; Simpkin, Marshall, and Co., London*).

V.—MENSURATION.

Examiner.—John Sykes, M.A., Assistant-Secretary to the Committee of Council on Education.

30. The calculation of the areas and circumferences of plane figures bounded by arcs of circles or right lines, and solid contents of cones, cylinders, spheres, &c. Candidates will be expected to be familiar with the different rules for measuring and estimating artificers' work, such as joiners', bricklayers', masons', and plumbers' work, and to be able to prepare estimates of such work from given quantities.

31. Text Books:—*Lund's Mensuration*, Part III. of his *Elements of Geometry and Mensuration*. *Tate's Mensuration*. *Young's Treatise on Mensuration* (*Sims and McIntyre*).

32. The Examiner, in speaking of last year's work, says:—"There are, as usual, several cases in which the working ought to have had more explanation."

VI.—TRIGONOMETRY.

Examiner.—Rev. T. G. Hall, M.A., Professor of Mathematics at King's College, London.

33. In Plane Trigonometry, the formulas for the trigonometrical functions of angles, the numerical solution of plane triangles, the use of logarithmic tables, and angular and exponential series.

34. Spherical Trigonometry, Napier's Rules, and the Solution of Spherical Triangles.

35. Text Books:—*Snowball's* or *Todhunter's Trigonometry*, *Trigonometry for Schools*, and for Spherical Trigonometry (*Christian Knowledge Society*), or any other of the modern treatises on Trigonometry. *Mathematical Tables* (*Chambers' Series*).

VII.—CONIC SECTIONS.

Examiner.—Rev. Bartholomew Price, M.A., F.R.S., Sedleian Professor of Natural Philosophy in the University of Oxford.

36. The properties of the three curves treated geometrically; also as deduced from the cone. The principles of projection, orthogonal and central, applied to derive the properties of the conic sections from those of the circle.

37. Analytical Conics, including the equations of the straight line, the circle, the three conic sections, and the general equation of the second degree.

38. Text Books:—*Drew's Conic Sections* (*Macmillan*). *Taylor's Conic Sections* (*Macmillan*). *Salmon's Conic Sections* (*Longmans*). *Todhunter's Conic Sections* (*Macmillan*).

VIII.—NAVIGATION AND NAUTICAL ASTRONOMY.

Examiner.—Rev. Joseph Woolley, LL.D., Director of Education for the Admiralty, and Inspector-General, Royal School of Naval Architecture and Marine Engineering, South Kensington Museum.

39. A good knowledge of Plane and Spherical Trigonometry, of the definitions and terms used in Nautical Astronomy, and of the various measurements of time and

their mutual conversions will be required, as well as skill in the use of logarithmic tables, and neatness, order, and accuracy in the numerical solutions of problems.

40. The candidate should understand the construction of charts; the nature and laws of circular storms; great circle sailing, &c.; the methods of determining the latitude, longitude, variation of the compass, and error and rate of a chronometer by astronomical observations, with the demonstrations of the formulae employed; the use of nautical astronomical instruments, &c.

41. Text Books:—The Nautical Almanac (*Murray*). Riddle's Navigation and Nautical Astronomy (*Low, Essex-street*).

42. N.B.—Candidates in this subject should be allowed the use of the Nautical Almanac and Tables during the Examination.

IX.—PRINCIPLES OF MECHANICS.

Examiner.—Rev. Jonathan Bates, M.A., late Fellow of Gonville and Caius College, Cambridge.

43. The properties of matter, solid, fluid, and gaseous.

44. Statics: The composition, resolution, and equilibrium of pressures acting on a material particle, and on constrained particles; machines; attractions.

45. Dynamics: The laws of motion; impact, projectiles; constrained motion; central forces; oscillation.

46. Rigid Dynamics: Motion of a rigid body about a point;—of a free rigid body;—of a system of rigid bodies.

47. Hydrostatics: Pressures of fluids; equilibrium of floating bodies; specific gravity; elastic fluids; machines; temperature and heat; steam; evaporation.

48. Hydrodynamics: Motion and resistance of fluids in tubes, &c.; waves and tides.

49. Pneumatics: Mechanical properties of air; the barometer, and other machines illustrating the mechanical properties of air.

50. Text Books:—Todhunter's Statics, or Parkinson's Mechanics. Goolwin's Mathematics. Miller's, Phear's, or Besant's Hydrostatics. Webster's Theory of Fluids. The treatises on these subjects in Orr's Circle of the Sciences. Golding Bird's Elements of Natural Philosophy, by C. Brooke (*Churchill*). Lardner's Handbooks on Natural Philosophy. Tate's Examples in Mechanics. Baker's Statics and Dynamics (*Weale's Series*). Twisden's Practical Mechanics. Rankine's Applied Mechanics.

X.—PRACTICAL MECHANICS.

Examiner.—T. M. Goodeve, Esq., Professor of Mechanics at the Royal Military Academy, Woolwich.

51. The applications of the principles of Mechanism to Simple Machines. The Steam Engine.

52. Text Books:—Bourne's Catechism of the Steam Engine (*Longmans*). Scott Russell on the Steam Engine. Macnaght's Elements of Mechanism, with remarks on Tools and Machinery (*Weale*). Goodeve's Elements of Mechanism, second edition (*Longmans*).

XI.—MAGNETISM AND ELECTRICITY.

Examiner.—Charles Brooke, Esq., M.A., F.R.S., Pres. M.S.

53. Construction and Properties of Magnets; Magnetic Instruments; Terrestrial Magnetism; The Mariner's Compass and its deviations in iron ships; Diamagnetism.

54. Franklinic Electricity; Voltaic Electricity; Electro-dynamics; Electro-teleggraphy; Electro-metallurgy; Thermo-Electricity; Organic Electricity.

55. Text Books:—Elements of Natural Philosophy, by C. Brooke (*Churchill*). Lardner's Handbooks of Natural Philosophy (*Walton and Maberly*). Jamin, Cours de Physique, Becquerel, Traité de l'Electricité et le Magnétisme.

XII.—LIGHT AND HEAT.

Examiner.—Richard Petter, Esq., A.M., late Professor of Natural Philosophy and Astronomy in University College, London.

56. What is the sense of sight?—ancient theories—modern definitions and hypotheses of the nature of light

—the especial privileges of animals which possess organs of vision—the simple laws or properties of light required to be known before we can discuss the structure of the eye, and the construction of telescopes, microscopes, and other optical instruments—what are foci of pencils of rays—how formed by reflection and refraction—real and virtual foci—optical images real and virtual—how do they occur in optical instruments.

57. Why do we distinguish between Physical and Geometrical optics?—what are double refraction of light—polarisation of light—interference of light—examples of these properties, how shown—phenomena of recurring colours—examples—how are explained the colours of the soap bubble—the colours seen on looking towards a light through the feathers of small birds—the colours of mother-of-pearl—the rainbow, &c., &c.—the laws of the interference of polarised light—to describe cases of these splendid phenomena.

58. What are the definitions of heat, radiant, latent, and sensible?—what is meant by caloric?—hypotheses of the nature of heat—capacity of bodies for heat—the temperature of bodies—how measured by instruments—descriptions of thermometers and pyrometers—the scales of thermometers—how compared—how the volumes of solids, liquids, and gases depend on their temperature—absolute zero of cold—elastic force of vapours and gases produced by heat employed in steam and air engines—winds from the unequal heat of the atmosphere. What are the connections and analogies of heat and light?

59. Text Books:—The Library of Useful Knowledge. Browster's Optics (Cabinet Cyclopædia). Potter's Physical Optics, the descriptive and experimental treatise or first part (*Walton and Maberly*).

XIII.—CHEMISTRY.

Examiner.—A. W. Williamson, Esq., F.R.S., Professor of Chemistry, University College, London.

60. Preparation and properties of the chief gases, acids, bases, and salts. Laws of combining proportion by weight and by volume. Analytical processes for the detection and separation of metals, acids, &c. Preparation and distinctive properties of the chief kinds of alcohol, of organic bases, fixed and volatile organic acids, sugars, woody fibre, starch, &c.

61. Candidates are expected to be able to explain chemical reactions by the use of symbols. Questions illustrative of general principles will be selected from the following, amongst other manufactures:—Metallurgy of lead, iron, and copper; bleaching, dyeing, soap-boiling, tanning; the manufacture of coal-gas, sulphuric acid, soda-ash, &c.

62. Text books:—Miller's Elements of Chemistry, Williamson's Chemistry for Students.

63. The Examiner, in speaking of last year's work, says:—"Many of the papers leave a good deal to be desired in the way of accuracy. Teachers of chemistry are apt to include in their courses of instruction a wide range of facts than their pupils can thoroughly master. Each step in the study of the science ought to be firm and clear, and even the very first steps ought to be samples of accuracy and clearness."

XIV.—MINING AND METALLURGY.

Examiner.—J. Arthur Phillips, Esq., Civil Engineer, Graduate of the Imperial School of Mines of France, &c.

64. Candidates should be able to identify with facility the ores of the more common metals, and be acquainted with their chemical composition. They should also be familiar with the forms of occurrence of the various metallic ores, and the usual methods employed for their extraction and subsequent purification by crushing, stamping, washing, &c. Underground surveying, the principles of ventilation, particularly as applicable to collieries; a knowledge of furnace assaying, and a general acquaintance with the metallurgy of the more important metals are also required.

65. First-class certificates can be given to those only

who have either acquired some practical knowledge of mining, or who possess a special acquaintance with the metallurgy of at least one of the useful metals.

66. Text Books:—Dana's Mineralogy (*Trübner and Co.*, Paternoster-row). Mitchell's Assaying (*Baillière*). Manual of Metallurgy (*Griffin*). Useful Metals and their Alloys (*Houlston and Wright*). Ure's Dictionary of Arts, Manufactures, and Mines (*Longmans*). Percy's Metallurgy (*Longmans*). Metallurgy of Iron, Truran (*Spon*). Mining and Metallurgy of Gold and Silver (*Spon*).

XV.—BOTANY.

Examiner.—Daniel Oliver, Esq., F.R.S., F.L.S., Keeper of the Herbarium at the Royal Gardens, Kew, and Professor of Botany in University College, London.

67. Sect. I.—The Structure of Plants and Vegetable Physiology. The Functions of the Various Organs, and their Morphological Relations. The Nature of the Principal Tissues. The meaning of Botanical Terms. The application of Structural and Physiological Facts to Practical Purposes.

68. Sect. II.—Systematic Botany. The general Principles upon which the Classification of Plants is based. The distinctive characters of the principal British Natural Orders of Plants. Naming Common Wild Flowers at Sight. The sources of the most important Economic Vegetable Products:—Timbers, Fibres, Fruits, Drugs, &c.

69. Sect. III.—Descriptive Botany. The Art of Describing Plants correctly in Scientific Language.*

70. Text Books:—Lindley's School Botany (*Bradbury and Evans*). Oliver's Lessons in Elementary Botany (*Macmillan*). Lindley's Theory and Practice of Horticulture (*Longmans*). Oliver's Guide to the Kew Museums (pamphlet) (*J. Reeve and Co.*).

71. Candidates will be expected to return three correct answers to questions in Section I., three in Section II., and at least two of the plants must be described and referred to their respective natural orders in Section III.

72. Students are very strongly recommended to the frequent practice of describing plants; at first on forms or "schedules," as given in Professor Oliver's "Lessons," page 59, and, when sufficiently advanced, in detail, as in the examples given at page 298 of the same work, and in Dr. Lindley's "School Botany."

XVI.—FLORICULTURE.

Examiner.—Thomas Moore, Esq., F.L.S., Curator of the Botanic Gardens, Chelsea, and Floricultural Director of the Royal Horticultural Society.

73. The leading Flowers of the different seasons, and how obtainable, whether by natural or artificial means, and under what modes of treatment.

74. Special Culture—Ferns, Orchids, Cacti, Heaths, Hardy Annuals, Bedding Plants.

75. Practical Operations.—Potting, Planting, Pruning, Training, Watering, Shading, Ventilating.

76. Flower-garden.—Pleasure-ground and shrubbery planting, materials for;—Flowering plants; Foliage plants. Sub-Tropical gardening. Geothermal culture. Lawns, formation and management of.

77. Flowering: how to induce or prevent by cultural agency. Influence of treatment on the formation and development of buds—leaf buds and blossom buds. Action of light on plants. Flower forcing.

78. Propagation.—The various modes of, and their special adaptations. Composts for different classes of plants. Acclimatization. Improvement or ennobling of races. Hybridization and cross-breeding.

79. Construction and warming of houses for plant culture. Atmospheric condition of plant houses. Influence of ventilation on plants grown in glass-houses. Ward's cases.

80. Text Books:—Lindley's Theory and Practice of Horticulture (*Longmans*). McIntosh's Book of the Garden

(*Blackwood and Sons*). Thomson's Gardener's Assistant (*Blackie and Son*).

81. The Examiner, in speaking of last year's work, repeats the recommendation before made, that "candidates should, as a part of their studies, practice the writing out of short pithy remarks on each of the subjects set down in the programme, comparing their own remarks with the statements in the text books, and repeating this from time to time, cutting out all superfluous words, so that they may get the essential particulars well impressed on the memory, and at the same time acquire a clear and condensed style of writing."

XVII.—FRUIT AND VEGETABLE CULTURE.

Examiner.—Robert Hogg, Esq., LL.D., F.L.S.

82. Sect. I.—Fruit-Tree Culture.—Kinds of Fruit adapted for various soils and exposures. The Propagation, Pruning, and Training of Fruit-trees. The Structure and Functions of the Organs of Trees, considered in their relation to growth and reproduction. The Forcing of Fruit-trees, and their Cultivation under glass, both in and out of pots. The Theory of Ripening, and the Principles that ought to Regulate the Preservation of Fruits after they are Ripe or their subsequent Maturation. The Packing of Fruit for transmission to great distances.

83. Sect. II.—Vegetable Culture.—The kinds and quantities of vegetable seeds and roots required for cropping gardens of given dimensions. The most approved mode of culture of the different kinds of vegetables and salads. The preparation of fermenting materials for artificial heating. The forcing of vegetables and salads.

84. Sect. III.—General subjects.—Soils, Water, Atmospheric Air, Light and Heat, in their relation to the successful cultivation of Fruit and Vegetables. Manures and their application. The Diseases and Insects to which Fruit-trees and Vegetables are subject, and their remedies. The erection, heating, and ventilation of garden structures.

85. Text Books:—Lindley's Theory and Practice of Horticulture (*Longmans*). The Cottage Gardener's Dictionary (*Bell and Daldy*). Hogg's Fruit Manual, 3rd edition (171, Fleet-street). Rivers' Miniature Fruit Garden (*Longmans*). Bréhaut's Modern Peach Pruner (171, Fleet-street).

XVIII.—ANIMAL PHYSIOLOGY IN RELATION TO HEALTH.

Examiner.—Dr. Michael Foster, Director of the Physiological Laboratory, and Teacher of Practical Physiology and Histology, University College, London.

86. The general principles of Animal Physiology, and the application of them to the preservation of health and to the wants and emergencies of daily life.

87. Text Books:—Huxley's Lessons in Elementary Physiology (*Macmillan*). Carpenter's Animal Physiology, 1859 (*Bohn*). Mapother's Physiology and the Principles of Disease (*Longmans*). Mapother's Lectures on Public Health (*Longmans*). Lardner's Animal Physics (*Walton and Maberly*). Translation of M. Edwards' Manual of Zoology (*Rowshaw*). Marshall's Descriptions of the Human Body, with Atlas (*Day and Son*), for details of Anatomy.

88. The Examiner, speaking of last year's work, says:—"A large number of the candidates were more anxious to show that they had learned by heart a series of technical terms than to make it clear to the examiner that they really understood what they were writing about. There was too much book-work—too little reflection over what had been read. There were also many instances of bad spelling, not only of technical, but also of common words."

XIX.—DOMESTIC ECONOMY.

Examiner.—Edward Carleton Tufnell, Esq., one of Her Majesty's Inspectors of Schools.

89. Candidates will be expected to possess such a knowledge of the essential elements of Mechanical and

* Living plants are provided by the Society for this examination.

Chemical Physics, Chemistry,* and Physiology, and of the general outlines of Natural History, as may enable them to describe the origin and properties of the articles, and the rationale of the processes indicated or suggested by the following heads, as well as to explain the practical rules which science suggests for the promotion of health and comfort, and for turning limited means to the best advantage:—

90. Dwellings for town or country; site, general design, details of parts, materials and processes of construction and decoration; fixtures and fittings; furniture, fabrics, and clothing; the philosophy of food based on the functions and requirements of the human frame, and on the chemical and hygienic properties of proximate constituents; unwholesome food; adulterations; preservation; condiments; culinary processes; refreshing, stimulating, and intoxicating beverages; fuel and other household stores; means for promoting a vigorous development of the frame, and for maintaining the healthy exercise of its functions; means of safety; the care of the sick; household management and accounts; best ways of investing savings and of providing against emergencies.

91. The questions will be comprehensively framed, so as to give to candidates a free scope for making evident the extent of their studies in the various departments of Domestic Economy. Sound practical notions of the most essential points throughout the whole range of subjects are desired, rather than a deep knowledge of a few of them.

92. Text Books:—*Tegetmeier's Domestic Economy (Home and Colonial School Society, Gros's Inn-road)*. *Healthy Dwellings, &c.*, a lecture by Henry Roberts, F.S.A. (*Ladies' Sanitary Association, 8, Pont-street, Belgrave-square*). *The Useful Arts employed in the Construction of Dwelling-houses; in the Production of Clothing and of Food (Longmans)*. *Lankester's Lectures on Food, 1st and 2nd Course*. *Tomlinson's Warming and Ventilating (Ward's Series)*. The necessary Physical, Chemical, and Physiological knowledge may be obtained from Chamber's Educational Course on the Sciences (*W. and R. Chambers*).

XX.—POLITICAL AND SOCIAL ECONOMY.

Examiner.—Charles Neate, Esq., M.A., M.P., late Professor of Political Economy in the University of Oxford.

93. The examination will be devoted to the study of Civil Government and Social Economy, as set forth in the 3rd and 4th books of Stephens' Commentaries on the Laws of England. N.B.—In order to meet the question of expense as regards this work, candidates are informed that the earlier editions, which are obtainable at a reduced price, may be used, so long as they are not earlier than the 3rd edition.†

94. Professor Fawcett's Manual of Political Economy (*Macmillan*) must be studied by those who desire to obtain first-class certificates.

XXI.—GEOGRAPHY.

Examiner.—Wm. Hughes, Esq., F.R.G.S., Professor of Geography in King's College, London.

95. Candidates must show a sound knowledge of Elementary Geography, physical and descriptive. Such knowledge must embrace an acquaintance with at least the outlines of the great natural features of the globe, the political divisions of countries, and the localities of towns and other places of importance. This knowledge will be looked for in fuller extent with regard to the British Islands, and the various portions of the British Empire, than with regard to other countries. The recent changes in the map of Europe—especially the cases of Germany and Italy—with the altered relationships between the various German States, may also be referred to as amongst the topics that

prominently demand attention on the part of the geographical student. Australia, New Zealand, and Germany (the last-named with reference to the changes consequent on the war of 1866), are proposed as subjects for more especial study on the part of the intending candidates for the ensuing year's examinations. In evidence of the knowledge possessed regarding those regions, the candidate will be required to sketch, from memory, a map of any one of the Australian colonies, or of any single European country, that may be named by the examiner. Such sketches need not possess accuracy of detail, but should at least show the general direction of coast-lines, mountain-chains, or river-courses, with the localities and names of the principal towns.

96. Candidates who aim at the highest class of certificate should be also prepared to answer such questions upon Geography, in its relation to the Physical Sciences and the History of Mankind, as involve a general acquaintance with the subject of climate, the laws of Meteorology, the Distribution of Plants and Animals over the Globe, the leading outlines of Geology, the Ethnographic Division of the Human Race, and the commercial resources of different lands. This kind of knowledge is looked for, not in place of geographical knowledge of a more elementary kind, but as supplementary to it, and throughout based upon it.

97. Text Books:—*Manual of Geography*, by William Hughes (*Longmans*). *Geography of British History*, by William Hughes (*Longmans*). *Guyot's Earth and Man (Longmans)*. *Page's Introductory Text Book of Geology (Blackwood)*. *The School Physical Atlas (either Johnstone's, Phillips's, or that published by the National Society)*.

98. The Examiner, speaking of last year's work, says:—"It cannot be too strongly impressed on intending candidates, that methodised study (as distinguished from merely desultory snatches at knowledge) is a condition indispensable to a high order of success."

XXII.—ENGLISH HISTORY.

Examiner.—The Rev. J. S. Brewer, M.A., Professor of Modern History in King's College, London.

99. English History and English Constitutional History.

100. Text Books:—*Manual of English History*, by Roes; or *The Student's Hume*. *Cressy's English Constitution*.

101. Special subject:—The Reign of Charles II. Lingard.

XXIII.—ENGLISH LITERATURE.

Examiner.—Rev. Samuel Clark, M.A., Chairman of the Board of Examiners.

102. Any two, but not more than two, of the authors in the following list may be taken up for examination:—*Shakspeare*—*King Lear*; *King John*; *The Merchant of Venice*. *Chaucer*—*The Prologue*; *The Knight's Tale*. *Bacon*—*The Essays*. *Craik*—*Outlines of the History of the English Language*.

103. Candidates are recommended to make a very careful study of the text of the authors they may select. The questions on each author will be divided into two sections, the first intended to test the candidate's acquaintance with the text, the second his knowledge of the subject matter, and his critical and literary information. Full marks will not be given for answers in the second section if those in the first section do not prove satisfactory. No marks will be given for anything beyond answers to the questions.

104. The Examiner, in speaking of last year's work, says:—"I regret to observe that, in spite of the repeated admonitions that have been given, there are some candidates who waste their time by copying out the questions on their papers."

XXIV.—LOGIC AND MENTAL SCIENCE.

Examiner.—J. D. McNeill, Esq., M.D., and one of Her Majesty's Inspectors of Schools.

105. Logic: Candidates will be expected to answer

* The use of symbols and equivalents will be optional.

† A limited number of copies of the 3rd edition are on sale at Messrs. Widdly and Son's, law booksellers, Lincoln's Inn-gateway, Fenchurch-street, price £1 each.

questions on the different processes of thought, and the symbols by which they are expressed. Every candidate must be prepared to analyse examples of reasoning, and to detect fallacies.

106. Text Books:—Whateley's Elements of Logic, or Morell's Handbook of Logic.

107. A Candidate for a second or third-class Certificate will be expected to prepare, in addition, any one of the following books which he may select:—Mill's System of Logic, Book III., Of Induction; Dugald Stewart's Outlines of Moral Philosophy (McCosh's Edition); or Sir William Hamilton's Lectures on Metaphysics, Lectures xx. to xl.

108. A Candidate for a first-class Certificate will be expected to prepare any two of these works which he may select.

XXV.—LATIN AND ROMAN HISTORY.

Examiner.—Rev. F. Temple, D.D., Head Master of Rugby School.

109. Cicero; De Nat. Deorum Lib. 1. Ovid Metam. Lib. 1.

110. Roman History to the death of Augustus Cæsar. Text Book:—Liddell's History of Rome, in one volume.

XXVI.—FRENCH.

Examiner.—Alphonse Mariette, Esq., M.A., Professor of French, King's College, London.

111. The Examination Paper will be divided into three parts.

112. The first will comprise grammatical questions and an extract from a modern French writer, to be translated into English. Candidates merely aiming at a 3rd class certificate should confine themselves to this first part.

113. The second part will comprise, together with a few grammatical questions, an English extract to be translated into French, and a list of idiomatic expressions to be rendered from French into English, or *vice versa*. This should be done satisfactorily by the Candidate who aims at a 2nd class certificate.

114. In the third part, Candidates for a 1st class certificate will have to translate an English extract into French (to which great importance is attached), and to answer properly (in French) some elementary questions on the two following subjects:—

1. French literature during the fifteenth century, and first half of the sixteenth.

2. The History of France, from the accession of Charlemagne to the death of Louis IX. (768—1270).

115. Books recommended:—Mariette: Half-Hours of French Translation (*Williams and Norgate*, London and Edinburgh). Nisard: Histoire de la Littérature Française, vol. I. (*Williams and Norgate*), or Demogrot: Histoire de la Littérature Française (*Williams and Norgate*). Duruy: Histoire de France, vol. I. (*Williams and Norgate*).

XXVII.—GERMAN.

Examiner.—Dr. Wintzer, Teacher of German in King's College, London.

116. The Examination paper will consist of four sections. The first will contain extracts from the works recommended for reading; the second grammatical questions and idioms; the third English phrases, an extract from an English author (both to be turned into German); and the fourth, questions on a period of the history and literature of Germany (stated in par. 123, below), and a theme to be worked out in German.

117. Each candidate must translate at least one of the extracts in section 1, but Candidates for first-class certificates two, one from prose, the other from poetry. The latter must also translate well from English into German, answer in German a few questions on the literature and history of Germany, and write (in German) a well-expressed essay on a subject which will be announced to them when they come up for examination.

118. Books recommended:—Schiller's Abfall der Lande (book I.); Marie Stuart (acts I. and II.); Goethe's Torquato Tasso (acts I. and II.); Kautz's Deutsche Geschichte (sechster Zeitraum; Karl V. zum westphälischen Frieden (1520—1648); F. v. S. Geschichte der Deutschen National Literatur, Abt. bis zum Ende des sechsten (Lombardischen) Regens.

XXVIII.—ITALIAN.

Examiner.—Signor Pistrucchi, Professor of Italian in King's College, London.

119. Candidates for first-class certificates will be required—(1st.) To translate into English passages some of the principal Italian poets and historians, to answer the grammatical questions which may be asked to those passages. (2nd.) They will also have to turn into Italian an extract from some English author, and turn a few familiar idioms into their equivalents from Italian into English, and *vice versa*.

120. For second and third-class certificates Candidates will translate into English some selection from La Fontaine's fables, and Foscolo or Manzoni's prose, and answer a certain number of grammatical questions.

XXIX.—SPANISH.

Examiner.—B. B. Aguirre, Esq., Lecturer on Spanish in King's College, London.

121. Candidates for a first-class certificate will be required to translate an English passage into Spanish, and to write in Spanish a short essay.

122. Candidates for a second-class certificate will be required to translate from English into Spanish, and to answer several questions upon the Spanish verbs.

123. Candidates for a third-class certificate will be required to translate from Spanish into English, and to answer several grammatical questions.

124. Books recommended:—Spanish Gil Blas, by Quixote de Mejico, por Dn. Jose Morales, San Sebastian; Trozos escogidos de los mejores hablistas españoles, Dn. Carlos Ochoa; Estudios filológicos, por Dn. M. Martinez de Morentin.—Don Quixote translated into English by Charles Jarvis.

XXX.—FREEHAND DRAWING.

Examiner.—F. S. Cary, Esq.

125. In freehand drawing the Candidate will be required to show a practical knowledge of the principles usually applied in the imitation of natural and artificial forms, such as furniture, manufactured articles, and foliage, and the human form.

126. The Examiner, in speaking of last year's examination, says:—"The drawings are quite up to the general average, but the candidates have sadly failed in answering the four questions relating to the proportions of the human figure."

XXXI.—PRACTICAL GEOMETRY.

Examiner.—Thomas Bradley, Esq., Professor of Geometrical Drawing in King's College, London, and at the Royal Military Academy, Woolwich.

127. Practical Geometry, or Geometrical Drawing, required by the Mechanic, Engineer, Builder, and in any way employed in the arts of construction.

Candidates will be examined in Practical Plane Geometry, the construction of right line figures of given areas, of curved lines required in the arts, &c.; in Practical Solid Geometry, Elementary Problems on the line, plane, in space, and their combinations, the representation by orthographic projection of simple solids in various conditions; in the principles of Development as applied to the construction of Maps, &c.; and in Elementary Descriptive Projection as far as it is required by the Architect.

128. Text Books:—Geometry, Plane, Solid, and Descriptive (*Library of Useful Knowledge*) is especially recommended as a work to be studied on Theoretical Geometry. Elements of Geometrical Drawing, published by

Committee of Council on Education, two parts (*Chapman and Hall*). Hall's Elements of Descriptive Geometry for students in Engineering. Heather's Descriptive Geometry. Also the following French Works:—*Elémens de Géométrie Descriptive*, par S. F. Lacroix; *Traité de Géométrie Descriptive* par Lefebure de Fourcy; *Nouveau Cours raisonné de Dessin Industriel*, par Armengaud, aîné, et Armengaud, jeune, et Amouroux; Bardin's Works on Descriptive Geometry.

129. The Examiner, speaking of last year's work, says that the numerous failures are "the result of the same causes which have been mentioned in previous reports—First, a want of elementary knowledge of practical co-ordinate geometry; and secondly, attempted constructions which the candidates should have felt were beyond their powers."

XXXII.—THEORY OF MUSIC.

Examiner.—John Hullah, Esq.

130. Notation, the modern modes, intervals, time signatures, the staff, transposition, modulation, terms and characters in common use.

131. The Elements of Harmony.

132. Musical History and Biography.

133. Arrangements must be made, in the Previous Examinations by the Local Boards, to test Candidates, by oral examination, in their knowledge or appreciation of the *sound* of musical successions and combinations. A form of the test to be used for this purpose by the Local Board at the Previous Examination, will be sent by the Council to such Local Boards as may apply for it in due time before the Previous Examination.

PRIZES FOR 1868.

THE PRINCE CONSORT'S PRIZE.

134. His Royal Highness, the late President of the Society, was pleased to offer annually to the candidate who, obtaining a certificate of the first-class in the current year, shall have obtained, in that year and the three years immediately preceding it, the greatest number of such certificates, a PRIZE of TWENTY-FIVE GUINEAS, and this Prize Her Majesty the Queen has graciously intimated her intention to continue. This Prize cannot be taken more than once by the same candidate. It will be accompanied by a certificate from the Society of Arts, setting forth the special character of the Prize, and the various certificates for which it was granted.

GENERAL PRIZES.

* * * None of these Prizes will be awarded to a Candidate who does not obtain a Certificate of the First-class in the subject.

1. Arithmetic (F)	{ First Prize, £5. Second Prize, £3.	17.*Fruit and Vegetable Culture { First Prize, £5. Second Prize, £3.	
2. Book-keeping (F)	{ First Prize, £5. Second Prize, £3.	18. Animal Physiology in relation { First Prize, £5. to Health (F)..... { Second Prize, £3.	
3. Algebra	{ First Prize, £5. Second Prize, £3.	19.*Domestic Economy (F)..... { First Prize, £5. Second Prize, £3.	
4. Geometry	{ First Prize, £5. Second Prize, £3.	20.*Political and Social Economy { First Prize, £5. (F)	{ Second Prize, £3.
5. Mensuration	{ First Prize, £5. Second Prize, £3.	21.*Geography (F)	{ First Prize, £5. Second Prize, £3.
6. Trigonometry.....	{ First Prize, £5. Second Prize, £3.	22. English History (F)	{ First Prize, £5. Second Prize, £3.
7. Conic Sections	{ First Prize, £5. Second Prize, £3.	23. English Literature (F)	{ First Prize, £5. Second Prize, £3.
8. Navigation and Nautical As- tronomy	{ First Prize, £5. Second Prize, £3.	24. Logic and Mental Science ..	{ First Prize, £5. Second Prize, £3.
9. Principles of Mechanics	{ First Prize, £5. Second Prize, £3.	25. Latin and Roman History ..	{ First Prize, £5. Second Prize, £3.
10. Practical Mechanics	{ First Prize, £5. Second Prize, £3.	26. French (F)	{ First Prize, £5. Second Prize, £3.
11. Electricity and Magnetism ..	{ First Prize, £5. Second Prize, £3.	27. German (F).....	{ First Prize, £5. Second Prize, £3.
12. Light and Heat	{ First Prize, £5. Second Prize, £3.	28. Italian (F)	{ First Prize, £5. Second Prize, £3.
13. Chemistry	{ First Prize, £5. Second Prize, £3.	29. Spanish (F).....	{ First Prize, £5. Second Prize, £3.
14. Mining and Metallurgy	{ First Prize, £5. Second Prize, £3.	30. Freehand Drawing (F).....	{ First Prize, £5. Second Prize, £3.
15.*Botany	{ First Prize, £5. Second Prize, £3.	31. Geometrical Drawing (F)....	{ First Prize, £5. Second Prize, £3.
16.*Floriculture	{ First Prize, £5. Second Prize, £3.	32. Theory of Music (F).....	{ First Prize, £5. Second Prize, £3.

SPECIAL PRIZES.

135. The whole of the General Prizes are offered to female candidates on the same terms as to male candidates; and, in each of the subjects marked F, an additional prize of £2 is offered by the Society of Arts to the *female* candidate who gets the highest number of marks with a certificate of the first-class. This special prize may be taken with, or apart from, any other prize.

136. In addition to the First and Second Prizes in Political and Social Economy offered by the Society of Arts, Mr. Harry Chester, a vice-President of the Society, offers a Third Prize of £2, and three prizes of books value £1 each, to candidates taking First-class Certificates in that subject.

137. In addition to the First and Second Prizes in Domestic Economy offered by the Society of Arts, Mr. Thomas Twining, a vice-President of the Society, offers a Third Prize of £2, and three prizes of books value £1 each, to candidates taking First-class Certificates in that subject.

138. In addition to the Prizes in Geography, offered by the Society of Arts to candidates taking Certificates of the First-class, the President and Council of the Royal Geographical Society offer an additional prize of £5 to the candidate who, taking any grade of certificate in Geography, shall obtain the highest number of marks in that subject.

139. In addition to the Prizes in Botany, in Floriculture, and in Fruit and Vegetable Culture offered by the Society of Arts to Candidates taking Certificates of the First Class, the Council of the Royal Horticultural Society offers three additional Prizes of £5, £3, and £1 respectively to the three Candidates who, taking any grade of Certificate in Botany, obtain the highest number of marks in that subject; also two additional Prizes of £5 and £3 respectively, to the two Candidates who, taking any grade of Certificate in Floriculture, obtain the highest number of marks in that subject; also two additional Prizes of £5 and £3 respectively to the two Candidates who, taking any grade of Certificate in Fruit and Vegetable Culture, obtain the highest number of marks in that subject. These Prizes are offered only to Candidates who are *bona fide* professional gardeners.

140. In addition to the Prizes in Floriculture, and in Fruit and Vegetable Culture, offered by the Society of Arts to Candidates taking Certificates of the First Class, the Proprietors of the *Gardener's Chronicle* offer three additional Prizes of £3, £2, and £1 respectively, to the three Candidates, being *bona fide* professional gardeners, who, obtaining a Second-class Certificate, at least, in Floriculture or Fruit and Vegetable Culture, shall obtain the highest number of marks in one of these subjects, and also a Second-class Certificate, at least, in Book-keeping or Mensuration.

** The Council have made applications to other Societies and to some of the City Companies, in reference to the offer of other Special Prizes. These applications are under consideration, and the Council have every reason to hope that they will be regarded favourably, but they have thought it undesirable to delay the issue of the programme until replies could be received. Notice will be given in the *Journal of the Society of Arts* (a copy of which is sent to each Institution in Union with the Society) of any additional Special Prizes that may be offered.

* * At the Annual Conference in 1867 it was recommended that, in addition to the Prizes open to Candidates in all parts of the country, each of the District Unions should establish Local Prizes for the Candidates within its own district, and the Society of Arts was asked to assist in the establishment of such Local Prizes. In any instance in which this proposal may be carried into effect, each District Union will announce its own Local Prizes.

LOCAL EDUCATIONAL BOARDS.

The following is a List of the places at which Local Boards have already been formed, with the names of the Secretaries, from whom intending Candidates and others may obtain information relative to the Examinations:—

LOCAL BOARDS.	SECRETARIES.	
Aberdeen	{ Mr. Jas. Sinclair, Mechanics' Institution, Aberdeen.	Aldershot and Farnham District
Accrington	{ Mr. W. Ratcliffe.	Alton
Acomb, near York	{ Mr. T. Copley, Acomb.	Ashford
Alderley Edge	{ Mr. G. W. Railton, Alderley Edge Institute.	Ashton-under-Lyne
		Bacup
		Banbridge (Ireland) Literary and Mutual Improvement Society
		{ Mr. Barrow Rule, M.C.P., Principal of the Classical and Mathematical School, Aldershot.

ELEMENTARY EXAMINATIONS.

The Society of Arts, ever since the establishment of its system of Examinations, has (while abstaining on its own part from examining students in elementary subjects) recommended the District Unions and Local Boards in connection with it to hold Examinations of this character, as preparatory to the Final Examinations of the Society. In order to aid them in doing this, and at the same time to promote, as far as possible, a uniformity of standard all over the country, the following definite scheme of elementary examinations is recommended for the use of the District Unions and Local Boards. It is in two grades, and the candidates should be allowed to select either grade at their discretion.

LOWER GRADE.

1. Every candidate must be examined in the first four rules of Arithmetic, simple and compound.
2. Female candidates must also be examined in plain needlework.
3. Male candidates must also be examined in one at least of the three following subjects:—
 - A. A General knowledge of the Gospel History.
 - B. The rudiments of English History.
 - C. The rudiments of the Geography of England.
4. Fairly good writing and spelling, with good reading of a simple narrative will also be required.
5. A satisfactory examination will entitle the candidate to a certificate (of the Lower Grade) from the District Union or Local Board.

HIGHER GRADE.

1. Every candidate must be examined in Arithmetic, including the Rule of Three, Decimal and Vulgar Fractions.
2. Every female candidate must also show proficiency in needlework.
3. Male candidates must also be examined in one at least of the four following subjects:—
 - A. The facts of St. Luke's Gospel and the Acts of the Apostles.
 - B. A General knowledge of English History, and especially of the reign of James I.
 - C. The Geography of Great Britain and Ireland.
 - D. English Grammar.

4. Candidates will be expected to write fairly, spell correctly, and express themselves grammatically.

5. A satisfactory examination will entitle the candidate to a certificate (of the Higher Grade) from the District Union or Local Board.

No candidates under 12 years of age should be admitted to either grade of these examinations.

The Secretary of any District Union or Local Board in connection with the Society of Arts, desiring to adopt this scheme of Elementary Examinations, must apply to the Secretary of the Society of Arts before the 10th of February, stating the number of male and female Candidates respectively desiring to be examined in each grade. Examination Papers* in the above subjects will then be forwarded to him, which of course must be kept secret from the Candidates until the time of the Examinations.

These Examinations must, in 1868, be held on the 10th, 11th, and 12th March, after four o'clock, p.m., as follows:—

TUESDAY, 10th March, After 4 p.m.	WEDNESDAY, 11th March, After 4 p.m.	THURSDAY, 12th March, After 4 p.m.
Arithmetic.	English History. Geography.	Gospel History. English Grammar.

The District Unions and local Boards will understand that they or their own Examiners must look through the Candidates' answers, and award the certificates. When this has been done, a return in the following form must be made to the Secretary of the Society of Arts, who will then forward the proper number of blank Forms of Certificate to be filled up by the Local Board:—

ELEMENTARY EXAMINATIONS, 1868.

Name of Board or }
District Union. }
No. of Centres _____

	HIGHER GRADE.		LOWER GRADE.	
	Examined.	Passed.	Examined.	Passed.
Males				
Females				
Totals				

Any Candidate who has obtained a certificate of the Higher or Lower Grade in these Preparatory Examinations in Elementary Subjects may, at the discretion of the Local Boards, if not less than sixteen years of age, be "passed" to the Final Examination of the Society of Arts in any of the special subjects in which his or her knowledge has also been properly tested.

* The uniform Examination Papers afford a common standard of examination; and, to promote uniformity in the application of that standard, special copies of the examination papers, with the number of marks to be awarded for a complete answer to each question, will be printed for the use of the local examiners. Thus, suppose that in a paper there are twelve questions, and that the aggregate number of marks assigned to the paper is 120; the number of marks placed opposite to each of the questions will depend upon their relative difficulty, and the proportion of these marks given by the examiner for the answer of any candidate will depend upon its accuracy and completeness. Supposing a perfect answer to a question to be set down as worth 20 marks, an examiner may award 20, 15, 12, or any lower number, according to the merit of the answer. Thus the candidates all over the country, though their papers be tested by different examiners, will be placed as nearly as possible upon an equal footing. No candidate should receive a certificate who does not obtain at least 30 marks in each paper, the whole paper being worth 120 marks. It is desirable that the same person should examine all the candidates in any one subject at any centre.

The Council of the Society of Arts, while desiring thus to aid local bodies in promoting elementary education, hope they will prevent the possibility of the

elementary certificates awarded by themselves being confounded with the certificates awarded by the Society of Arts.

The foregoing Programme of Examinations is published in a separate form, and may be had *gratis* on application to the Secretary of the Society of Arts.

PUBLIC KITCHENS IN PARIS.

In Paris, as in London, public kitchens have been established by philanthropic societies with variable success, but during the early part of the present year the system of providing cheap and good nourishment for all who desired to avail themselves of such advantages has been tried on a large and well-regulated plan by the order of the Emperor. The Prefect of Police, to whom the experiment has been entrusted, has just made his report to the Emperor, and this document contains much valuable information for the authorities and benevolent associations of all large cities, and, in fact, for all who feel an interest in the working and poorer classes.

The establishments to which the report refers are known as the *Pourneaux Economiques du Prince Imperial*; they are eight in number, and located in seven of the poorer arrondissements of Paris. They were open generally from the first of January to the end of May, embracing, on an average, a season of 117 days. The sales amounted to 1,244,766 portions, namely:—

	Portions.
Meat	166,347
Soup	248,881
Vegetables (dry, principally haricot beans)	267,514
Rice	46,145
Potatoes	5,394
Bread	510,665

The loss in consequence of atmospheric influences is stated at only 3,831 portions, which says much for the care of the Sisters who had charge of the establishments. The actual average cost of these portions of food is stated to have been $\frac{7}{10}$ of a penny, to which has to be added rather more than $1\frac{1}{2}$ centime, or less than half a farthing, for the cost of administration. The 510,665 portions of bread cost 28,950 fr. 85 c., and sold for 25,528 fr. 25 c., showing a loss of about a farthing per lb.

The account for the season stands thus:—

	fr.	c.
Rent of eight establishments	6,320	0
Repairs and arrangement	1,148	62
Furniture and fittings	18,689	27
Expenses of the staff, including the Sisters and their assistants	3,955	50
Outlay for bread	28,950	85
" meat	30,498	70
" vegetables and rice	13,296	10
Fuel	2,430	90
Sundry expenses	5,334	34
	110,624	28
Amount of receipts for viands sold ..	62,237	80

Leaving a debit of £1,935 8s. 10d., or 48,386 48.

But against this there remains on hand the whole of the stoves and other apparatus for future operations, so that the cost of the campaign must be estimated as follows:—

	fr.
	58,386
Less cost of material	18,689
Deducting say 10 per cent. for wear and tear	1,868
	16,821
	31,565

or about £1,263 for the eight kitchens in operation during five months.

The influx of applicants was beyond the means of the establishments, and did not fall off to the last moment of the season, and it was found that without causing a loss of time, which to the working classes is of course of the utmost importance, each kitchen could only meet an average demand of 1,000 or 1,200 portions per day.

The customers are classified by the Prefect under two heads—women or children who purchased provision for their families, and working men who took their morning meal at the kitchen; the latter class amounted in some establishments to four or five hundred per day, the Sisters doing all in their power to prevent loss of time to their visitors.

A fear was entertained, it is stated in the report, that the workman would soon become tired of a diet in which there was scarcely any variety, but this is stated not to have been the case, and the visitors were almost always the same; this is attributed, and with great probability, to the great care exercised in the cooking, which rendered the dishes always palatable. The hope is entertained, moreover, that those who for five months were well satisfied with plain but highly nutritious viands, will not again recur to other and less economical food, and on this point, and also as regards the cost of the victuals sold, we find the following passage:—"It is impossible that the visitors should not have been struck with the fact that with two litres of soup costing two pence, a pound of meat sold for three pence, and about three litres of vegetables, also costing three pence, or eight pence in all, it was possible to feed a family of four or five persons." Even supposing that circumstances should cause these prices to be doubled, it is argued it would be advantageous to continue these kitchens, not only as a welcome aid to the working classes in indigent seasons, but as a valuable lesson in economy, as the working classes would thus learn that by co-operation they could produce the same effect for themselves.

As regards the collateral effects of these establishments, the Prefect says that it was ascertained that the regular frequenters of the kitchens were enabled, through the reduced cost of their meals, to provide themselves with warmer clothes for the winter season, to redeem their pledges from the *mont de piété*, to pay off debts, and that the painful scenes which constantly occur when rent becomes due almost entirely ceased in the quarters in which the kitchens were situated.

Fine Arts.

FREE EXHIBITION OF PICTURES, PARIS.—A new exhibition is being organised in Paris by M. Constant Cimetière; the subscription is fixed at the sum of 24 francs yearly, by instalments, and artists may take as many subscriptions as they please, each conferring the right of exhibiting one work of art during the whole year, the artist being allowed to change one picture for another when he pleases. The conditions are—that the works exhibited shall be insured against liabilities as regards rent, &c.; that in case of injury the directors shall repay the artist two-thirds of the value of the work as fixed by himself; that a register containing the names and addresses of the artists, with the numbers and prices of the

works exhibited, shall be open to visitors; that the directors shall make no charge for sales; that artists shall send in their works within one month of the opening day, or of the date of their subscription, or forfeit their claim to a place on the walls; that the price of admission shall be half a franc on week-days, and half that sum on Sundays; that the exhibition shall remain open all the year round; and that each subscribing artist shall have two free passes at his disposal.

THE SAINTS CHAPELLE.—The restoration of the beautiful chapel built by Pierre de Montreuil, by order of St. Louis, is just terminated; besides the chapel, which is well known to visitors, there is another below, which has hitherto been closed; this is now completely repaired, the walls decorated with paintings, the windows filled in with stained glass, and the floor laid with mortuary stones of the fourteenth and fifteenth century; this chapel will shortly be added to the list of interesting sights in Paris.

Manufactures.

SILK PLANT.—The United States consul at Lambayeque, in Peru, has made a communication to his government respecting a plant which yields a fibre closely resembling silk. It is an evergreen shrub, attaining the height of three to four feet, and the silk is contained in a pod, and is said to be superior, both as regards fineness and quality, to that of the silk worm. The young branches of the plant are also said to yield long brilliant fibres, finer and stronger than the best flax. The Indians make from these fibres a cloth, which although coarsely woven, is described as remarkably good. The plant is about to be introduced into the United States on a large scale. The value of this communication would be more apparent if some indication of the species to which the shrub in question belongs were given, and if it were stated whether the silk or cotton from the pods requires to be spun, or will wind like true silk.

NEW FIBROUS MATERIALS.—Much attention is being given in France and elsewhere, at present, to the preparation of fibres from various indigenous and acclimated plants. M. C. Peyre, a chemist, of Nancy, is said to have produced fibres from the nettle which closely resemble fine hemp, and unbleached fibres of the olive, which, it is believed may, when tanned with the gallic acid from the bark of the same tree, become valuable for sail-making. The treatment of the fibres of the mulberry-tree was attempted by means of caustic lye, for the removal of the woody and gummy portions, but it was soon found that the alkali ruined the fibre; it is now said that M. Peyre has prepared a special solution for the purpose which has not the same mischievous action, but its composition is not revealed. The result is stated, however, to be the production of a supple and brilliant fibre, closely resembling floss silk. Another chemist, M. Lucien Tracol, of Bourg-Argental, is also busy upon the mulberry fibres, and his experiments are said to hold out good prospects of success.

Commerce.

STRUCTURE, &c. OF WOODY FIBRES.—M. Payen, the eminent French chemist, has presented an interesting paper to the Academy of Sciences, on the "Structure and Constitution of Woody Fibres," of which the following are the conclusions:—1. The subject of substitutes for textile fibres is one of great interest, and promises a gradual increase in the consumption of paper, which naturally follows the happy impulse given to general education. 2. In a scientific point of view, it is

proved by a considerable annual consumption, representing more than one-tenth of the total amount of the raw materials of paper, that the cellulose extracted from various and even from ligneous fibre, more or less covered with other matters, is chemically identical. 3. That the less compact spongy cellulose forming the matter of ligneous incrustations may be detached from the cells by means of acids, which convert it into glucose capable of undergoing alcoholic fermentation. 4. That thus two products may be obtained from the wood of various trees; alcohol, and membrane of cellulose sufficiently strong, flexible, and pure, to be used in making all kinds of paper, and even for the whitest kinds, in the proportion of 80 per cent. 5. That this experimental demonstration is equally interesting in an agricultural point of view, for it opens up a new market for the products of plantations of *coniferae*, which have the special quality of rendering productive and healthy the immense tracts of waste country which are to be found in France.

Colonies.

QUEENSLAND SUGAR.—"In a paper read before the Queensland Philosophical Society," says the *Queensland Journal of Commerce*, "it was satisfactorily shown that Queensland could compare favourably with Jamaica in the economical production of sugar. The cultivation in Queensland of one acre of plant canes would cost about £6; the same quantity cultivated in Demerara would cost £6 17s. 6d. The ratoon canes, grown at the latter place, require as much weeding, draining, and shovel-ploughing as plants, thus adding considerably to the cultivation; whereas in Queensland, thrashing only is sufficient, and a saving of 50 per cent. is effected. The climate of Queensland does not induce the rank growth of weeds, so common in other countries, thus reducing the amount of labour necessary, and rendering Queensland a country in which the cultivation of sugar requires less labour than any other sugar-growing country in the world." The same paper also states that "a Maryborough firm is vigorously engaged at their mills in manufacturing sugar from cane grown in that locality. The success which has hitherto attended them considerably exceeds their anticipations. The canes which have been put through their mills had stood beyond the proper time for cutting, and had consequently lost a considerable quantity of saccharine matter; nevertheless, the yield of sugar and molasses is at the rate of \$84 4s. per acre of cane. The proprietors of the mills are confident that when fully-matured canes are placed in their hands, the highest prices hitherto obtained will be exceeded. By July, over 100 acres of such canes were probably to be ready for these mills, when it is expected that Maryborough sugar will come into general use."

Notes.

SCHOLASTIC REGISTRATION ASSOCIATION.—This association proposes to hold an Educational Congress at Birmingham, in the autumn of the present year, for the discussion of certain most important questions. At the last annual meeting it was resolved to make the association the basis of a periodical Educational Congress, which will, no doubt, exercise powerful influence in the country, and tend greatly to advance the highest interests of education, by bringing educators of various classes and opinions into annual conference on questions affecting themselves and, more especially, their profession, and by affording the friends of education the means of exchanging views with those who are practically engaged in the work. The Council of the College

of Preceptors has appointed the following gentlemen to co-operate with the association in making arrangements for holding the proposed Congress:—Dr. Aldom, Rev. Dr. Haig-Brown, Dr. Hodgson, Mr. Payne, Mr. Robson, Mr. Barrow Rule, Dr. Schaible, Rev. Dr. West, Dr. White. Further particulars may be obtained from the hon. sec., Mr. Barrow Rule, Aldershot.

Journal of the Society of Arts.

FRIDAY, JULY 26, 1867.

Announcements by the Council.

SOCIETY'S VISIT TO THE PARIS EXHIBITION.

Arrangements have been made for the visit the members to the Universal Exhibition, 7, as follows:—

The visit will extend from Monday, the 29th of July, Friday, the 16th of August.

Reception Room has been provided for the of the members at No. 43, Rue Saint Georges, where members can have their letters addressed, where they can write their letters, make appointments and engagements, and where notices of any special matters connected with the visit will be suspended. Members requested to register their names and addresses here their arrival in Paris. Lists of Hotels and Lodgings will be provided.

Arrangements have been made by which the Members of the Society of Arts will, through the kindness of the proprietors, be admitted, on the presentation of their cards of membership, to inspect Imperial and Municipal establishments, factories, and workshops in the following list:—

His Excellency the Minister of Public Instruction has kindly arranged for the Members visiting the cities of Paris, and has also further favoured the society with tickets to view the exhibition of the works of the pupils in the Communal schools, and of the collections made by the Scientific Commission of Mexico.

The Director of the Imperial Mint (La Monnaie) has given instructions that members of the Society, when provided with their cards, which will be prepared for the purpose, shall be admitted to that establishment on Wednesdays and Fridays, at three o'clock.

The Director of the Imperial Observatory has arranged that the Members presenting their cards of membership at that establishment shall be admitted on Saturdays, between half-past two and four o'clock.

Monsieur le Sénateur, Prefect of the Seine, has politely promised to make proper arrangements for the visits of the members to the catacombs, sewers, and municipal establishments.

Through the kindness of M. Belgrand, the water engineer to the City of Paris, permission has been obtained for members to visit the Waterworks of the City of Paris at Menilmontant, on any day to the 5th August inclusive.

The Director of the Public Ways and Promenades of the City of Paris has thrown open the horticultural and other municipal establishments in his department, and has most obligingly tendered his assistance to the members.

M. Le Play, Commissaire-General of the Universal Exhibition, has very kindly expressed his desire to aid the members in any way in his power.

The following gentlemen and companies have politely opened their establishments to the Society:—

MM. J. F. Cail and Cie., engineers, Quai de Billy, No. 48, and Grenelle. Any day of the week, from 6 to 11 a.m., and from 12 to 5.

M. F. Barbedienne has furnished tickets of admission to visit his bronze foundry and workshops, 63, Rue de Lancry, on any day in the week, from 6 a.m. to 5 p.m.

MM. Barbezat and Cie., foundries, 58, Boulevard Prince Eugene, and 95 and 97, Rue Richard-Lenoir. Open to the members without restriction as to the day or hour.

MM. Ch. Christophe and Cie., gold and silversmiths, 56, Rue de Bondy, will receive a party of the members on any day appointed by the Society, between 12 and 2 o'clock.

MM. Hachette and Cie.'s great publishing establishment will be open to members on any day, between half-past 8 and 11 o'clock, by presenting their cards to M. Fourret, a member of the firm.

M. Ch. Lahure, Imprimerie Générale, 9, Rue de Fleurus, on any day and at any hour, except between 12 and 2 o'clock.

MM. A. Chaix and Cie., printing establishment, 20, Rue Bergère, on Friday in each week.

MM. Mazaro-Ribaillier and Cie., furniture manufacturers, Exhibition rooms, 20, Boulevard des Filles de Calvaire; manufactory, 4 and 6, Rue Ternaux Popincourt, freely open to the members.

The Directors of the Compagnie du Chemin de Fer de Paris à Orléans have given leave for the members to visit their new passenger station and goods station, on presenting their cards of membership to M. Renault, Chief Architect of the Company, No. 1, Boulevard de l'Hôpital; or to M. Prevel, 42, Quai de la Gare; according as they desire to see the passenger station or the goods station.

Mr. W. E. Newton will show the Artisans' Dwellings now being erected for H.I.M. the Emperor, in the Avenue Dumesnil. The days and hours for visiting will be notified at the Reception-rooms.

Nothing could exceed the politeness with which the various gentlemen have met the requests of the Society, and there is no doubt that in a day or two several other establishments will be added to the list.

Cards of membership, enabling members to take advantage of these arrangements, may be obtained on application to the Society's House, John-street, Adelphi, or at 43, Rue Saint Georges, Paris.

P. LE NEVE FOSTER, Secretary.

The following list of hotels will be found useful:—

IN THE NEIGHBOURHOOD OF THE TUILERIES.

Hôtel Meurice, 228, Rue de Rivoli.

- " Windsor, 228, "
- " Brighton, 218, "
- " Wagram, 208, "
- " Rivoli, 202, "
- " du Louvre, 166, "

ON OR NEAR THE PRINCIPAL BOULEVARDES.

Grand Hôtel, 12, Boulevard des Capucines.

Grand Hôtel des Capucines, 37, Boulevard des Capucines.

Hôtel Scribe, 1, Rue Scribe.

- " de Bade, 32, Boulevard des Italiens.
- " du Tibre, 8, Rue du Helder.
- " du Helder, 9, Rue du Helder, Boulevard des Italiens.
- " Brezil, 16, Rue du Helder.
- " de Lancastre, 22, "
- " de l'Amirauté, Rue Neuve Saint Augustin.
- " Choiseul, 7, Rue de Choiseul.
- " des Deux Mondes, 8, Rue d'Antin.
- " des Etats Unis, 16, Rue d'Antin.
- " de la Grande Bretagne, 14, Rue Caumartin.

RUE ST. HONORÉ, &c.

Hôtel de Lille et d'Albion, 223, Rue St. Honoré.

- " St. James, 211, Rue St. Honoré.
- " Choiseul, 241, Rue St. Honoré.
- " du Danube, 11, Rue Richepance.
- " Richepance, 14, Rue Richepance, near the Madeleine.
- " de l'Amirauté, 20, Rue Duphot.

RUE DE LA PAIX, PLACE VENDÔME, &c.

Hôtel de la Paix, 32, Rue de la Paix.

- " Westminster, 11, Rue de la Paix.
- " Mirabeau, 8, "
- " Bristol, 5, Place Vendôme.

Hôtel du Rhin, 4, Place Vendôme.

" Castiglione, 12, Rue Castiglione.

PALAIS ROYAL AND BOURSE.

Hôtel des Etrangers, 3, Rue Vivienne.

Grand Hôtel de France et d'Angleterre, 72, Rue Richelieu.

Hôtel d'Angleterre, 56, Rue Montmartre.

" Bergère, 32, Rue Bergère.

Grand Hôtel de la Marine, 3, Rue des Vieux Augustins.

Grand Hôtel d'Albion, 20, Rue Boudot.

Hôtel Boudot, 6, Rue Boudot.

Grand Hôtel de la Bourse, 15, Rue Notre Dame des Victoires.

NEIGHBOURHOOD OF THE NORTHERN RAILWAY.

Hôtel de Chemin de fer du Nord, opposite the Railway Station.

Grand Hôtel du Nord, 45, Rue Lafayette.

Grand Hôtel de Strasbourg, 78, Boulevard de Strasbourg.

Hôtel Violet, Passage Violet, Faubourg Poissonnière.

BETWEEN THE WESTERN RAILWAY STATION AND THE MADELEINE.

Hôtel des Etrangers, 24, Rue Tronchet.

" Tronchet, 22, "

" Folkestone, 9, Rue Castellane.

" Bedford, 17, Rue de l'Arcade.

" de l'Arcade, 43, Rue de l'Arcade.

" Navarin, Rue Navarin.

SOUTH SIDE OF THE SEINE.

Hôtel d'Amsterdam, 59, Rue Saint André des Arts.

" des Beaux Arts, 1, Rue Beaux Arts.

" Bretagne, 20, Rue de Seine.

" " 46, St. André des Arts.

" de Breteuil, 1, Rue Dauphin.

" Clovis, 69, Rue Monsieur le Prince.

" Suffren, Avenue Suffren, Champ de Mars.

RAILWAYS AND STEAMBOATS.—The terminus of the Auteuil and Exhibition Railway is at the Western Station, Place du Havre. 2nd class carriages only 50c., intermediate stations 40c. Trains leave the terminus at 27 minutes, and the Exhibition at 25 minutes past each hour; there is an extra up train at 5.57. The Circular Railway (Chemin de fer de Ceinture) has stations all round Paris, and joins the preceding at Auteuil. The large omnibuses of the American Railway run from the Bourse, and carry passengers for the Exhibition to the Pont d'Alma. Steamboats run from the Place de la Concorde every quarter of an hour for the Exhibition. Landing stage on the Paris side of the Pont de Jena. Other steamboats ply between the Champ de Mars and the Ile de Billancourt. Landing stage on the lower side of same bridge.

NUMBERS OF HOUSES IN STREETS.—Even Nos. on right side, odd Nos. on left side of street, progressing in direction of the stream of the river, or commencing from the river in transverse streets.

POSTS RESTANTE.—Letters addressed "Poste Restante" to be applied for at the head post-office, 9, Rue Jean-Jacques Rousseau; but members can have their letters addressed to No. 43, Rue St. Georges.

CAB FARES IN PARIS.—Two kinds of cab—single seat for two; double seat for four.

Fare either by the "hour" or the "course," at the option of the hirer ("course" any distance without stoppage).

Fares.—Two-place cab, 2f. per hour; 1.50f. per course; four-place cab, 2.25f. per hour; 1.70f. per course.

Driver's usual gratuity, 6 sous per hour; 3 or 4 sous per course.

Extra charge between 12.30 night and 6 morning.

" " when taken from "Remise" (coach-house).

" " beyond the fortifications.

" " for luggage.

Ticket containing full particulars of authorised charges always to be given by the driver on entering his cab.

OMNIBUS FARES.—30 centimes (3d.), inside; 15 centimes (1½d.), outside.

MONEY.—Gold:—20 francs, 10 francs, and 5 francs. Silver:—2 francs, 1 franc, ½ franc, and 20 centimes. Copper:—10 centimes (2 sous) = 1d.; 5 centimes (1 sou) = ½d. £1 = 25 francs, usual exchange.

ARTIZANS' VISIT TO PARIS.

Her Majesty's Government have granted the Society of Arts, in aid of the fund now being raised by the Society for assisting workmen, specially selected from various trades to visit and report on the Paris Exhibition, a sum of £500, conditional on the Society raising a like amount by public subscription.

The following is the list of subscribers to the present date:—

H.R.H. THE PRINCE OF WALES, President ..	£31 10
HER MAJESTY'S GOVERNMENT (conditional) ..	500 0

Messrs. J. M. Johnson and Sons have kindly placed at the disposal of the Council a number of their five-shilling English Catalogues of the Exhibition, sufficient to present each workman with a copy.

Subscriptions may be forwarded to the Financial Officer, at the Society's House.

The Council are now prepared to receive the names of any workmen recommended by their respective trades as fit and proper persons to undertake this important duty on behalf of their fellow workmen.

Proceedings of the Society.

FOOD COMMITTEE.

PRESERVATION OF MEAT.

Messrs. Medlock and Bailey have put forth a plan for the preservation of meat, poultry, and fish. It appears, from a printed document issued by those gentlemen, that—

"Something like two hundred patents have been taken out in this country for the 'Preservation of Food,' many of them, indeed, within the last few years; but, as is very well known, with the exception of some specially intended for preserving fruit and vegetables, there has hitherto been no really efficient and reliable process by which the decomposition or decay of food products in general could be prevented. It is true that, taking the subject as a whole, numerous and important improvements have been made; in the manufacture of ice and refrigerating machines; in the modes of pickling or salting meat; in the compressing and sealing in tins of various preparations, &c., &c.; but all these contrivances, even when most successfully carried out, present some objections which are fatal to their general use; they are either injurious to the flavour or destructive to the nutritive value of the substances intended to be preserved; the processes themselves are too complicated in their action or too uncertain in the results obtained; or, lastly, the cost of the preserved substance is such that it is useful only in an auxiliary sense, and is utterly inapplicable to the every-day requirements of the people at large.

"By a few minutes' labour, and at a trifling outlay, anything of animal origin—from a beefsteak to a bullock; from a whitebait to a whale—can now be preserved sweet, wholesome, and uncontaminated, for days, weeks, or months, if necessary, wholly irrespective of country, climate, or time of year.

"In the first place, it will be as well to consider for a moment the chief causes of failure hitherto in the preservation of meat, fish, poultry, &c., speaking, of course, in a practical and commercial—not a scientific point of view—as it is well known that many operations can be successfully performed in the chemist's laboratory which are far too difficult and expensive to be carried out upon a large scale. We may dismiss the preservation of food products by means of ice or freezing mixtures in a word, as they are evidently capable of very limited application. Some of our large butchers, fishmongers, &c., keep their goods in ice cellars during the hottest seasons; but this practice is quite exceptional, and probably not one per cent. of the dealers in such perishable articles have the means of keeping them moderately cool in summer. Even in these instances the advantages to the public are considerably modified by the fact that frozen animal food, when exposed to a warm temperature, will putrify with very great rapidity. According to Dr. Castell, animal food, and more especially fish, is always rendered less nutritious by the freezing process, and is the cause of much ill-health.

"Of the other methods of preserving animal food the call for a passing notice, the salting or curing plan must of necessity rank foremost, as it has been in use for centuries, and, to a moderate extent, is convenient,

popular, and beneficial. Salt, however, is powerless to preserve meat effectually in any but the coldest weather, unless so large a quantity is employed that substances thus treated are both unpleasant to the palate and dangerous to the health.

"Suffice it that in excess salt is very injurious, and that, innocent as it is popularly believed to be, more than one case of 'poisoning' by its use has been recorded by Dr. Christison and others. Another and a grave disadvantage attending the use of salt is, that meat loses from one-quarter to nearly half of its nutritive value in the usual salting processes, and is almost entirely robbed of those mineral constituents, more particularly potash, the want of which induces scurvy and other diseases."

"Of the dried, powdered, compressed, or extracted meats we need say but little; their applications are so extremely limited that it is out of the question to consider them in relation to the broad subject of food for the people. For travellers, invalids, children, &c., they are frequently of service in the absence of more rational food, but their cost is always treble or quadruple that of the more common but practically wholesome beef and mutton.

"Lastly, we must notice the meats put up in hermetically-sealed tin canisters, either with or without the addition of salt, spices, or antiseptics. It cannot be denied that these preparations have proved of great utility to our soldiers, sailors, and explorers, as a change from the 'odious salt meats,' and that they have exercised a marked influence upon the health, comfort, and general physique of these classes of our countrymen during the last twenty years; but we have still to reiterate the same fatal drawbacks to their general use, namely, uncertainty, want of flavour and nutrition, costliness, and, in many cases, a very unpleasant metallic taste derived from the containing vessel. Besides these special disadvantages, which vary with each particular process, there is another and a serious one, common to all the preserved meats of this class:—They are, without exception, prepared at a temperature considerably above the boiling point of water, and are, consequently, much over-cooked in the first instance.

"Similar objections, in a greater or less degree, apply also to those preparations which are merely coated with a thin film of some substance, which is air and water proof, such as wax, paraffin, collodion, gutta-percha, &c.; while, if the protecting envelope of these last is broken or punctured at any one point, however small, decomposition sets in immediately."

Messrs. Medlock and Bailey go on to say their "process for the preservation of animal substances possesses manifold advantages over all others hitherto proposed, but more especially those of economy and simplicity of application. By its means the meat, poultry, game, fish, &c., of a large household, or wholesale establishment, can be effectively preserved for months in any weather, at a nominal expenditure of time and money; no soldered tin cases are required; no complex apparatus is necessary; no want of flavour or nutritive power is the result; and, finally, whether the edibles thus treated are eaten in two days' or two months' time, nobody, save the actual manipulator, need know anything about it.

"In the case, say of a small family who wish to keep a leg of mutton, or a sirloin of beef, for a week in sultry thundery weather, with the thermometer at 90 deg., take

* Dr. Marcet's plan of enclosing the meat in bladder, or some similar material, before immersing it in the brine, by no means obviates these objections, although, to a certain extent, an improvement upon the old method.

† By "uncertainty" we mean that when once a tin of 'preserved meat' is soldered down, no person can tell what it is, or in what condition it may be. Many of these tins are wrongly labelled, and our readers will remember that in 1851 (out of one particular batch only), of 6,000 tins of preserved meat supplied under contract to Government, and opened, more than 5,000 contained putrid meat and offal!

a teacupful of 'Medlock and Bailey's Patent Bisulphite of Lime Solution,' a dessert spoonful of common salt, and about a quart of cold water, mixing the same in an earthen pan, basin, or other suitable vessel. Dip the meat in this mixture for a few minutes, taking care with the end of a cloth to wet it all over, then hang the joint up as usual. A dip, night and morning, will ensure its keeping sweet and fresh for any length of time. If the weather is unusually hot, a cloth soaked in the same solution may be wrapped round it with advantage.

"Game or poultry may be treated in precisely the same manner, having been first plucked and drawn. Pigeons, too, should be previously gutted. Eggs may be kept in the fresh or 'new laid' condition, simply being completely covered over with brine soaked in the same liquid mixture; while bacon can be preserved from getting 'rusty' by this simple plan. If the joints are large and numerous the proportions should be the

Bisulphite of lime	2 quarts.
Common salt	1 pint.
Water	4 gallons.

"When the meat, &c., is required for cooking, that is necessary is to lay it in cold water for a few minutes, and afterwards to dry it thoroughly in a shed on a close inspection no odour or other alteration whatever will be apparent—the lean will not be rancid nor the fat changed to the deep yellow tint which is apparent with 'hung' meat, and the texture will be at first, firm and consistent. Nay, more, if, not content with the evidence of our ordinary senses, we place a section under the microscope, we shall observe that the general structure of the tissues has not suffered in the slightest degree; and if we went further, and delivered the whole to an analyst, his report would be that various nutritious principles were present as usual, and had not sustained the slightest injury.

"With the view of testing the effects of this preservative, in tropical climates, some beef, mutton, salmon, lobsters, &c. were treated by Medlock and Bailey's patent process, and exposed in a chamber specially arranged for the purpose, to a temperature varying from 80 deg. to 110 deg. Fahr. Portions of the same joints, fowls, &c., not prepared in any way, began to emit an unpleasant odour in about 16 hours, and were absolutely putrid in 12 more, while those treated with the preservative mixture showed no sign of decay whatever during the whole period of twelve days; from the high temperature to which they were subjected, a rich oily matter separated from the fish, but the original odour and flavour remained unimpaired to the end of the time, even the lobsters being pronounced 'delicious, evidently just boiled,' by those who partook of the same. The eggs which had not been treated with the bisulphite, &c., all, more or less, decomposed under the influence of the heat, while the others remained 'new-laid' throughout. In a word, these experiments intended to test, in the most severe manner, animals treated with bisulphite of lime, at a tropical temperature, simply afforded still further evidence of its practical use.

"At the time at which we write, some three months since the trials we have just recorded, all the fowls, &c., remaining uneaten are perfectly good and sweet, although exposed to the ordinary changes of temperature, &c., in a rather warm room."

Proceedings of Institutions.

EXAMINATION PAPERS, 1867.

The following are the Examination papers set in the various subjects at the Final Examination held in April last:—

(Continued from page 549.)

GEOMETRY.

THREE HOURS ALLOWED.

1. If one side of a triangle be produced, the exterior angle is greater than either of the interior opposite angles.
2. The three interior angles of any triangle are together equal to two right angles. Show how this may be proved experimentally as well as by reasoning.
3. In any right-angled triangle the square described upon the side subtending the right-angle is equal to the squares described upon the sides containing the right-angle.
4. Divide a given right line into two parts, so that the rectangle contained by the whole and one of the parts shall be equal to the square of the other part. What is the numerical ratio of the part so found to the whole line?
5. Equal straight lines in a circle are equally distant from the centre.
6. The opposite angles of any quadrilateral figure inscribed in a circle are together equal to two right-angles.
7. Upon a given straight line describe a segment of a circle which shall contain an angle equal to a given rectilineal angle.
8. Inscribe a regular hexagon in a given circle.
9. In a right-angled triangle, if a perpendicular be drawn from the right-angle to the base, the triangles on each side of it are similar to the whole and to one another. Prove this. Hence show how to find a mean proportional between two lines.
10. In equal circles, angles at the centre have the same ratio to one another which the circumferences on which they stand have to one another.
11. If two straight lines are at right-angles to the same plane, they shall be parallel to one another.
12. If straight lines be cut by parallel planes, they shall be cut in the same ratio.

PROBLEMS.

1. If the sides of a quadrilateral be bisected, and the points of bisection be joined, the included figure is a parallelogram, and its area is half the area of the original figure.
2. Place a straight line in a circle which shall be commensurable with the diameter.
3. If two sides of a quadrilateral described about a circle be parallel, each of the other sides will subtend a right angle at the centre of the circle.
4. If on the sides of a quadrant semi-circles be described, the part which is common to both semi-circles is equal to the part of the quadrant which is exterior to both.
5. If a straight line be drawn cutting any number of concentric circles, show that the segments it cuts off cannot be similar.
6. Through a given point draw a circle touching a given circle, and also another circle passing through the given point.
7. There cannot be more than two similar triangles inscribed in the same segment of a circle.
8. In an isosceles triangle inscribe three circles, each of which shall touch the other two and also two adjacent sides of the triangle.
9. How can a line be drawn perpendicular to two lines which are not in the same plane?
10. Two points are taken on two walls which meet at right-angles, or at any angle, what will determine the position of the shortest line from one point to the other?

MENSURATION.

THREE HOURS ALLOWED.

1. Find the area of the rectangle which is 14ft. 6in. long and 4ft. 3in. broad; and the length of the rectangle which contains 172ft. 18in. and is 6ft. 9in. broad.
2. A wooden partition is 69ft. 11in. long and 42ft. 7in. high; what will it cost at £6 15s. per square?

3. Find the number of gallons contained in a cistern 6ft. 8in. long, 3ft. wide, and 2ft. 6in. deep. Find also the cost of lining it with sheet lead of 10lbs. to the foot at £2 2s. per cwt.

4. Find the area of a piece of land from the following notes:—

	186	
	130	64
56	72	32
	28	18
50	0	

5. The diagonals of a quadrilateral intersect one another at an angle of 80° , the perpendiculars upon them from the four angles are 1, 2, 3, 4: show that the area of the quadrilateral will be either 21 or 24 or 25.

6. Two rectangles each six inches long and an inch broad are laid across one another so that the part in contact is half the area of one of the rectangles: show how this may be done.

7. A regular triangle, square and hexagon, have their perimeters of the same length, compare their areas; and, if their areas be equal, compare their perimeters.

8. A number of concentric circles are described with radii of 1, 2, 3, &c., inches forming circular rings: find which of two consecutive rings are to one another as 15 to 17. Also find two rings which are to one another as 1 to 8.

9. Find the radius of a segment-arch, having given the span and the rise.

10. A right-angled triangle, whose sides are 6, 8, and 10 inches, is made to turn round its greatest side, thus describing two right cones: find the volume contained within them.

11. A right pyramid has for its base an equilateral triangle whose sides are 10 inches long, and the area of its three sides is twice that of the base: find the height the pyramid, and the length of one of its edges.

12. A conical vessel is half filled with fluid, and when half as much more is poured in the surface rises an inch: find how far the surface is then below the top of the vessel.

13. A sphere of silver (specific gravity 10.5) of 10in. in diameter is covered with a coating of gold (specific gravity 19.25) $\frac{1}{16}$ th of an inch thick: compare the volumes and weights of the two metals, and find the weight of the silver.

TRIGONOMETRY.

THREE HOURS ALLOWED.

1. Find the number of grades in the angle of a regular octagon.

2. Find the sine and cosine of 15° and 18° .

$$\text{If } \tan. (9a + 3b) = 2 + \sqrt{3}$$

$$\text{and } \tan. (7a - 2b) = 2 - \sqrt{3} \text{ find } a \text{ and } b.$$

3. Express $\sin. (A + B)$ in terms of the sines and cosines of A and B, where A and B are each less than 90° ; first, when $A + B$ is $< 90^\circ$, and secondly, when $A + B$ is $> 90^\circ$.

4. What is the logarithm of .0625 to a base 8?

5. In a triangle, $a = 133$; $b = 7$; $A - B = 90^\circ$, find C; when $\log. 3 = .4771213$;

L. $\tan. 41^\circ 59' = 9.9541834$; L. $\tan. 42^\circ = 9.9544374$.

6. If $\pi = 17a$, find the value of $\frac{\cos. a}{\cos. 3a + \cos. 5a}$ and show that

$$\sin. (a+b) = \sin. a + \sin. b + 2 \sin. a \sin. b \cos. (a+b).$$

7. A B C D is a square, and O a point within it; having given the distances of O from A, B, and C, find the length of the side of the square.

8. Find the radius of the circle which touches one side of a triangle and the other two sides produced. If the centres of the three circles so described be joined, prove that the area of the triangle thus formed = $\frac{abc}{2r}$

a, b, c , being the sides of the Δ and r the radius of the inscribed circle.

9 Prove in a triangle ABC , that

$$c = a \cos. B + b \cos. A.$$

and thence obtain the cos. C in terms of the sides.

10. Show that

$$(1.) 4 \cos. a \sin. 3a + 4 \sin. a \cos. 3a = 3 \sin. 4a.$$

$$(2.) \text{ If } \cos. \theta = \frac{\cos. \rho - c}{1 - c \cos. \rho} \text{ then } \tan. \frac{\theta}{2} = \sqrt{\frac{1+c}{1-c}} \tan. \frac{\rho}{2}$$

11. The upper half of a column of given height, seen from a point on a level with the base of the column, subtends an $\angle = \tan. \frac{1}{3}$, find the distance of the point of observation, and the elevation of the column.

12. $ABCD$ is a parallelogram, AC and BD the diagonals, given AB , $\angle CAD$ and $\angle DBC$, find the area of the parallelogram.

13. Show that,

$$\tan. n\theta = \frac{\sin. \theta + \sin. 3\theta + \sin. 5\theta + \dots \text{ to } n \text{ terms.}}{\cos. \theta + \cos. 3\theta + \cos. 5\theta + \dots \text{ to } n \text{ terms.}}$$

14. Find the cosine of the angle of a spherical triangle in the terms of the cosines and sines of the sides.

15. Deduce from the above result the values of $\sin. \frac{A}{2}$ and $\tan. \frac{a}{2}$.

16. State Napier's rules, and if c be the middle part and C the right angle, prove that case of the rules.

17. Solve the oblique-angled triangle C , a, b being given.

CONIC SECTIONS.

THREE HOURS ALLOWED.

SECTION I.—GEOMETRICAL CONICS.

1. Define a cone, and show that, if it is cut by a plane parallel to one of its slant sides, the ordinate of the curve formed by the section varies as the square root of the abscissa. What is the co-efficient of variation?

2. In the parabola prove that (1) the tangent bisects the angle between the focal distance and a line parallel to the principal axis, (2) the sub-tangent is equal to twice the abscissa.

3. Prove that tangents drawn at the extremities of a focal chord of a conic intersect in the directrix, and show that in a parabola they intersect at right angles.

4. Define an ellipse in reference to a focus and a directrix, and prove that the sum of the focal distances of any point in the curve is equal to the major axis.

5. What is the auxiliary circle? Prove that perpendiculars drawn from the foci on a tangent intersect the tangent in the auxiliary circle.

6. Prove that the area of a parallelogram circumscribed about an ellipse and having its sides parallel to conjugate axes is constant.

7. Deduce the preceding proposition from a property of the circle by projection.

8. Draw tangents to a hyperbola from a given point without it.

9. If the normal at any point P of a hyperbola meets the transverse axis in G , then $SG : SP :: CS : CA$.

10. Define an asymptote to a hyperbola, and, given the centre and length of the axes, construct the asymptotes.

SECTION II.—ANALYTICAL CONICS.

11. Investigate the equation to a straight line, and find the co ordinates of the point of intersection of two given straight lines.

12. Find the length of the perpendicular from the origin on the line passing through the two points (x', y') and (x'', y'') .

13. What is the equation to the circle, radius $= c$, referred to two tangents perpendicular to each other as co-ordinate axes? Also what is the equation to the normal which passes through the origin?

14. Find the equation to the normal of a parabola, and determine the point at which the normal at the extremity of the latus rectum again meets the curve.

15. Prove analytically the theorems contained in 2, 3, 5, 6, 9 of the preceding section.

16. If the base and ratio of the sides of a triangle are given, prove that the locus of the vertex is a circle. What are harmonic conjugates?

17. Show that the equation to a hyperbola may be put into the form $xy = k^2$; give a geometrical interpretation of the equation.

(To be continued.)

PARIS EXHIBITION.

The hall of conference, or lecture-room, in the park of the Exhibition, has not had the success expected by its promoters, and the Imperial Commission has decided that gratuitous lectures or conferences shall in future be given either in the galleries of the Exhibition itself, or in the buildings without, in the locality of the objects to which they refer. The new series has just commenced, and the following is a portion of the programme:—

Tuesdays, from 10 to 11 o'clock, in the French machine gallery, M. Thomas, engineer:—1. On the manufacture of caoutchouc, illustrated by apparatus exhibited by MM. Guibal, Aubert, Gérard and Co. 2. On apparatus for washing in vacuo, exhibited by M. Berjot.

Thursdays, 8 to 10 a.m., in the park, Allée du Forum. M. Rouart, civil engineer, on the manufacture of ice, and the square machine exhibited by Messrs. Mignot and Bouart.

Fridays, 1 to 3 p.m., park, Allée de Bretagne, M. Thomas, on candle making.

Tuesdays and Fridays, 8 to 11 a.m., in the chemical laboratory established by the side of the river, near the Pont de Jena, M. Wiesnegg, exhibitor, on heating apparatus for laboratories. Experiments in the fusion of iron by Schlæssing's process; experiments in the fusion of copper by Perrot's process.

Thursday and Saturday, 8 to 11 a.m., same locality. M. Giroux, on the regulation of gas, and experiments on the regulation and illuminating power.

Tuesday and Friday, 2 to 5 p.m., same place, M. Swarzweber, conferences and experiments on the industrial production of oxygen, Tessié du Motay and Marchal's process.

Wednesday, 2 to 4 p.m., same place, Baron de Planet, experiments in galvano-plastics.

Tuesdays, from 2 to 5 p.m., and Fridays, from 9 to 11 a.m., same place, M. Pontier, exhibitor, on distilling apparatus for laboratories and private houses.

M. Ferdinand de Lesseps will also explain the work of the canal of the Isthmus of Suez, the various difficulties that have been surmounted, and the actual state of the works, on Tuesdays, the 23rd and 30th of July, and 6th August, at 10 a.m. These conferences will be held in the circular building in the park, before the panorama of the Isthmus.

MAURITIUS AND NATAL, AS SUGAR PRODUCING COUNTRIES, COMPARED.

The *Natal Mercury*, of a recent date, makes the following remarks on the above subject:—"At a time when we are anxiously looking out for any stray gleams of hopefulness that may shoot athwart the gloom of commercial depression, the interest which Mauritians are at last beginning to take in our colony is exceedingly cheering. Until now our neighbours in the Isle of France have rather despised and pooh-poohed us. They have ignored our sugar producing capabilities; affected disbelief in the success of sugar manufacture here; and regarded us as an obscure, insignificant little colony, which was attempting work far beyond its capacities. Now

ere has been rudeness in the way we have been treated the Mauritians. They have always heard what we d to say, and whenever Natalians have visited them ere has been no backwardness in giving information, offering advice, and in dispensing unbounded hospitality. But they have fondly clung to the conviction at a country subject to visitations of frost, and so far moved from the tropics, could not grow sugar cane profitably during successive years. Latterly this illusion has been wearing off. Year after year sugar cane has been grown, and sugar made in an increasing tio. A considerable export has been made. Mauritius rokers have read "Natal" quoted at fair rates alongside their own. Visitors from the island have personally inspected the colony, and returned with favourable reports of its natural features and capabilities. And ow that misfortunes have befallen them, and the respects of enterprise in their own sphere are clouded ad contracted, the good people of Mauritius incline to ok more curiously upon a colony where congenial pursuits are followed, where there is boundless scope for expansion, and which is more accessible to them than ny other.

"It is clear that many years' experience of various drawbacks have made the Mauritians anxious about their ature. The borer, disease, drought, and hurricanes, ave at last reduced their cup to half what it once was. labour is costly there; food is dear; the climate is recarious; above all, the area of available land is imited—is, in fact, pre-occupied. We by no means hink that Mauritius is in such a bad case that recovery s hopeless. A few years may find her more prosperous han ever. But meanwhile, the circumstances of the olony are such, that we don't wonder its residents are asting their eyes abroad in search of "fresh fields and pastures new," where their sons may plant themselves and their fortunes afresh.

"The advent of a number of young Mauritius planters, urred with means enough—in the shape of credit or capital—to buy up old estates, or start new ones, would, we believe, be an undoubted boon. They would afford a market for the sale of embarrassed estates, where want of capital has made it impossible for the proprietors to carry on. They would transplant here the systems and the experience of the most successful sugar producing field in the world. They would place sugar planting on a new basis, and identify with our interests the large monetary and other institutions which offer to planters in Mauritius facilities little known here. If we wish to introduce sugar planters, then, a better class of men cannot be desired than these would be.

"Nor do we think that Mauritians will be disappointed in their experience here. They will find land and labour both plentiful and cheap; a climate far healthier, less oppressive, and more equable than their own; a virgin soil, which, even on the oldest plantations, has not yet been enriched by manure, except on a partial scale; and provisions moderately cheap. That they will also find much, in connexion with sugar planting, that they dissent from and disapprove of, is highly probable. Every Mauritian who has come here has said that radical improvements were necessary. It will be for them to give force and value to their objections, by showing that they can do better. When they do that, we have no doubt that Natal planters will but too gladly follow in their wake, and profit by their examples.

"Had we here such a government as one finds in some other places, and a local immigration department established, able to cope with any emergency that may arise, this important tendency on the part of Mauritius planters would be fostered and guided by the powers that be. The Mauritians seem to us to desire authoritative information, and they would attach more weight to representations proceeding from Government than from any other quarter. There would be no impropriety in governmental action on such a subject. The matter is one of vital consequence, and might affect most

materially the welfare of the country. Had we such a department as the Legislative Council has often proposed should be established, instead of a feeble Board, which can show no practical results of its long but weakly existence, it would naturally and properly fall within its province to communicate to the Government of Mauritius such data as might be required by persons there, in coming to a decision upon the expediency of migration. There would be no impropriety in such a course of action—nothing that would be foreign to the functions of an enlightened Government. But our executive seems in dire want of some powerful stimulant to effort. It has done nought so far to restore us. Its intentions, we believe, are good, but its works are inappreciable, while its action has been partially paralysed by the inconclusive policy of the legislature. When the colony needs more than ever strong guidance and help, it is most helpless. But Heaven helps those that help themselves; and despite the shortcomings of its rulers, we trust that the self-reliant energies of the colonists, individually, will enable them, unaided, to retrieve their misfortunes, and to gain their ends. In any case, should any Mauritians come here on a 'prospecting' mission, or with actual views of settlement, we can promise them, on the part of the colonists, a cordial welcome, and all the facilities that we have it in our power to offer."

Fine Arts.

ENGLISH AMATEURS OF ART IN FRANCE.—Only a short time since, Bordeaux lost the best friend of artists, and one of the most enlightened connoisseurs and friends of art, in Mr. Scott, late British consul at Bordeaux. Marseilles has just suffered a similar loss by the death of Mr. Robert Gower, of that city. Mr. Gower had one of the finest collections of works of art in the south of France; his private residence, called the Château de Repentance, at Aix, was a perfect museum of paintings, sculpture, antiquities, porcelain, and faïences of a very high class.

THE BRITISH INSTITUTION.—A correspondent of the *Standard*, after expressing his great regret at the contemplated dissolution of this establishment, which for "more than half a century has been of the greatest service to art and its highest development in the sister studies of painting and sculpture," gives the following particulars:—"On referring to a carefully-compiled hand-book, entitled 'Recollections of the British Institution,' by Thomas Smith, published in 1860, we find that, since the foundation of the institution to the year 1859, no less a number of original paintings by British artists than 23,150 have been exhibited in the gallery, and that the sales arising from such exhibitions, without any expense to the artists, have amounted to more than £150,000; and, on looking through the catalogues of these various exhibitions, many then comparatively unknown names occur in the early ones which in later days became famous and celebrated all over the world. Amongst them may be mentioned Beechey, Bourgeois, Calcott, Copley (father of Lord Lyndhurst), Daniel, Fuseli, Howard, Lawrence (a future president of the Royal Academy), Northcote, Opie, Reinagle, Smirke, Stothard, Bird, Turner, Ward, Benjamin West (another president of the Royal Academy), Westall, Shoe and Eastlake (two other future presidents of the Royal Academy), Linnell, Haydon, Wilkie, Collins, Etty, Constable, Hilton, Martin, Jones, Hayter, Landseer, Briggs, Mulready, Ross, Stark, Jackson, Stanfield, Danby, Lealie, Uwins, Roberts, Herbert, Pickersgill, &c. In donations to artists and complimentary premiums, by way of encouragement to the young and meritorious, the institution has given some £15,000; and in the purchase of pictures and sculpture, which in most instances have been given to the nation—as may be seen by a visit to

Greenwich and Chelsea Hospitals, the National Gallery, and many of the metropolitan churches—some £13,000 in addition."

CERAMIC MUSEUM, LIMOGES.—A large number of specimens of modern china and earthenware in the Paris Exhibition have been purchased for or presented to the Museum of Limoges. This establishment was heretofore scarcely known in Paris, and it is now brought prominently before the world by the perseverance of the director of the museum, M. Adrien Dubouché, who made an appeal for subscriptions in the Limoges journals, and in a few weeks obtained 9,000 francs; he then visited the Exhibition, made some purchases, and the potters were so well pleased with the idea of seeing specimens of their productions placed in a museum, that they presented more than 20,000 francs' worth for that purpose to M. Dubouché, who is collecting more subscriptions to purchase specimens of the pottery of foreign countries. Messrs. Minton, Copeland, Wedgwood and other English firms, whose table services, enamelled and brown stoneware are in great request here, have all contributed towards the collection of the museum. M. Dubouché's next object is to obtain specimens of Spanish pottery, of the curious red and blue ware of Morocco and Algeria, of the Japanese porcelain, and the decorative tiles of Egypt and Persia. The idea of a museum of modern ceramic is a good one, and it is very appropriately situated in a town whose productions of a kindred kind are held in such high esteem. The Berlin Museum is also purchasing and collecting largely in the same field.

Manufactures.

LONDON GAS.—The course of six lectures on coal gas, recently delivered by Professor Frankland at the Royal Institution, concludes with the following protest against the bad quality of London gas:—"What, then, is our position in this great and wealthy city with regard to the supply of gas—in this the metropolis of the country, which annually yields such vast quantities of the finest gas-coals in the world, and sends these coals half round the earth to illuminate the cities of other nations? An inspection of the table I have just referred to fails to convince me that we are fairly and considerably treated in this respect. Perhaps as consumers we are rather partial in the matter; but still we are entitled to be heard from our point of view. To obtain the light with which the inhabitant of Edinburgh or Glasgow illuminates his drawing-room, we have to burn double the amount of gas, and to have the atmosphere of our drawing-room contaminated with double the heat and moisture, and many times the amount of sulphurous acid. Some sixteen years ago I examined analytically and photometrically the gas supply of the metropolis, and I have no hesitation in saying that it was better then than now. How is this to be accounted for? Has invention, which has been so busy in improving other manufactures, left that of gas untouched? By no means. Improved retorts, exhausters, and purifying processes have been brought forward in abundance. Have, then, the gas companies disregarded these improvements? By no means. Whenever the improvement promised to reduce the cost of the manufacture of gas, they have eagerly adopted it. Thus, within the time I have just mentioned, they have revolutionized their process of purification, having adopted a method which greatly decreases the cost of that purification, and increases the volume of the gas, but which reduces its illuminating power by 11 per cent., and makes it utterly unfit for use in dwelling-houses, by leaving it contaminated with those sulphur compounds which, on combustion, impregnate the surrounding air with stifling fumes of sulphurous acid. Thus an improvement which reduces the cost of production, but seriously deteriorates the quality of the gas, has been universally adopted,

whilst inventions which have had for their object the improvement of the quality of the gas as delivered to consumers, but which have offered no advantage to the producer, have been, without exception, utterly ignored. I do not enter into the subject of price, though something might be said on this head, because, in a wealthy city like this, cost is, with most consumers, a secondary consideration. The man who spends thousands in furnishing his mansion has a right to expect, in the present state of science and manufactures, that his house shall be lighted with a material that shall not damage and destroy the works of art and the things of beauty with which he surrounds himself. He has, I conceive, a right to demand that, in this respect, he shall not be treated worse than the inhabitants of second or third rate towns. He is willing to pay any fair price for such an article, since, if the present price were doubled, it would still be far cheaper than that of any other illuminating agent; but he must have good quality, for without it this grand invention of the century is lost to him. Let the metropolitan companies see to this in a liberal spirit, and let the consumers understand that low-priced gas is not necessarily cheap gas, and then we shall soon, I hope, have a gas of not less illuminating power than two candles per five cubic feet per hour, below which quality no gas is fit for domestic use."

ICE-MAKING MACHINE.—Messrs. Flower and Sons, brewers, Stratford-on-Avon, have for several years used ice for preserving yeast and for other brewing purposes. They have now, after a long series of trials, succeeded in applying Kirk's patent ice-making machine (described in this *Journal*, October 7, 1864). The machine they have in use is capable of producing three tons of ice in twenty-four hours; and it can also be employed in cooling beer direct, by passing cold brine instead of spring water through the refrigerators.

Commerce.

IMPORTS AND EXPORTS OF FRANCE.—The Customs returns for the first five months of the present year exhibit extraordinary changes in the commerce of the country. The imports of cereals and other alimentary matters caused by the badness of crops amount to 93,000,000 of francs more than in the same months of last year, while the exports show a diminution of 198,000,000 of francs (£7,920,000). This great deficit is made up of the following items:—Diminution of 116,000,000 on agricultural produce; of nearly 72,000,000 on miscellaneous matters; of 40,000,000 on silks; of 11,000,000 on woollens; 6,000,000 on made-up clothing; between 3 to 4,000,000 on articles of fashion; 4,000,000 on cotton goods; and 3,000,000 on metal work. The totals for the five months are given as follows:—

	France.
Importation	1,303,000,000
Exportation	1,293,000,000
Difference	10,000,000

During the same five months last year the exports exceeded the imports by the sum of 323,000,000 francs.

Colonies.

QUEENSLAND COTTON.—A Brisbane paper says that it is expected that this year cotton will prove a large feature in the exports of this colony. Last year the exports were 196,698 lbs. clean, and 10,568 lbs. unclean cotton, and this year the crop promises to reach up to 3,000 bales, or about three times that of last year. The crop generally is heavy and of good quality. The average of green seed sowing promises about 300 lbs. of clean cotton to the acre.

IRON MANUFACTURE IN AUSTRALIA.—The question of the manufacture of iron is now occupying considerable attention in South Australia, the iron ores of this colony being unbounded in quantity, lying close to the surface of the ground, and of extraordinary richness, some of them 90 per cent. The difficulty is want of coal, but there are inexhaustible forests of wood for smelting, and even if coal had to be imported from New South Wales the extreme richness of the ores would doubtless more than make amends for the extra cost of fuel.

Notes.

AERONAUTICAL SOCIETY OF GREAT BRITAIN.—On Monday, the 15th inst., a meeting of the members of the Aeronautical Society was held in the great room of the Society of Arts; his Grace the Duke of Argyll in the chair. Dr. Wm. Smyth, L.R.C.P., read a paper upon some experiments he had made upon the powers of flight of birds. He found that the wing of a strong pigeon strikes the air with a force which will raise a pound weight one foot high in a minute. But directly the stroke has produced its greatest mechanical effect, it is suddenly cut short, nerves in the wing of the bird letting it know when the maximum effect is attained. He succeeded in cutting some of the nerves of the bird from the organs of motion, the result being that, although the bird flapped the air harder than before, it could not fly. He thought, therefore, that in attempting flight by means of artificial wings, the stroke must be cut short when it has attained its maximum. On these principles he proposed a machine with artificial wings, propelled by motive power obtained from the explosion of mixed oxygen and hydrogen gases. The heat thus produced is not great, and the gases would be exploded in indiarubber accordion-shaped vessels, and these by their expansion would give the stroke. Major J. Scott Phillips proposed a machine with large flat planes before and behind, which would lie in an inclined plane when flying, so as to heap up before and beneath the machine a pressure of air equal to its own weight. It had hoof-shaped wings, propelled by a steam-engine. A paper by Mr. F. Bourne described a little model which raised itself in the air by screws. Mr. Henri Reda St. Martin, a Corsican, exhibited a model machine, made on the principle of a kite, the pull of the string being supplanted by the hold on the air obtained by means of screws. Mr. W. Sadd exhibited a model raised by horizontal cylindrical balloons, and propelled by a screw. Mr. F. W. Breary read a paper by Mr. Artingstall. A few remarks were made by Messrs. F. H. Wenham, C.E., Mackie, Young, H. Bright, and others, and the meeting closed.

CHANGE IN THE CAB SYSTEM OF PARIS.—The Municipal Council of Paris has, it is said, come to the determination to adopt mileage rates in place of the present course system. The new tariff announced is as follows: For a vehicle carrying two persons—85 centimes for the first kilomètre; 25 centimes for each kilomètre after. For one carrying four persons—90 centimes the first kilomètre; 30 centimes each kilomètre beyond. A kilomètre being roughly five-eighths of a mile, and 90 centimes rather less than nine pence, the latter rate will be equivalent to about seven pence for the first half mile, and less than three pence for each succeeding half mile. The difference between the price of the two and four horse vehicle is so trifling as to be almost nominal. The present system is certainly unjust to all parties. To pay for a very short course fifteen or eighteen pence, according as the cab has seats for two or three, with a gratuity to the driver, is certainly too high, while a course from one extremity of Paris to the other is certainly too long for the same money; but to carry the new plan into successful operation it is held here that a meter is absolutely necessary to settle the question of distance, and although

an immense number of instruments have been produced for the purpose in Paris, it was the opinion of the municipal authorities a very short time ago that none of the meters submitted for trial were entirely satisfactory. It is to be hoped that the resolution of the Council alluded to indicates the production of a suitable instrument.

Correspondence.

INDUSTRIAL EDUCATION AND THE PARIS EXHIBITION.—SIR,—I have just read in the *Engineer* of 12th July a paper written by Mr. James Kitson, junior, and produced at the annual meeting of the Yorkshire Union of Mechanics' Institutes, which I recommend you to re-print, as being a fair and suggestive comparison between the relative positions of the United Kingdom and foreign countries in the competition for industrial supremacy. It is as follows:—

"The question of industrial education has been raised in a letter recently published in the *Times* by Dr. Lyon Playfair, and our president has directed the attention of several of our friends to it, who will probably shortly address you; to confine the discussion I will, therefore, content myself at the present moment by considering the remarks and proposals of Dr. Playfair, though it is a topic which might be advantageously examined in a more extended manner. I will first reply to the statement made by Dr. Lyon Playfair, that a singular accordance of opinion prevailed, that our country (England) had shown little inventiveness, and had made but little progress in the peaceful arts of industry since 1862. This is a very bold and a very disparaging statement, and is so derogatory to our country that it is desirable to examine into the grounds on which it is based, and to see whether it is not rather an opinion founded on limited or deficient information, than one which is a true representation of the progress of arts and manufactures in our country. In the first place, it is incorrect to judge of the manufacturing excellences and the power of production of England from the objects and collections at the Exhibition. France has exposed the products of her manufactures at her own doors, and what is of more importance to her, in her own market. England has had to transport her articles across the sea, at a much greater cost, and to a market which is to a great extent closed to her. France has in manufactures as well as in war a great idea of glory; England has in trade little idea of glory, but a great idea of doing what will pay. The French have an opportunity of gaining both glory and profit, and hence have been induced to make great efforts to appear well at their universal Exhibition. It is important to bear this in mind, and if we attempt to compare the industrial progress of France with that of England, we must remember that France has shown the choicest products of her manufactures, while we have much at home superior which it has not been thought advantageous to represent at Paris. The great houses of France have spent enormous sums of money on their displays, which no English firm would have been justified in spending. Indeed, it is said that so of the foreign exhibitors have received subvention from their States, while English exhibitors have to defray the whole of their own expenses. true our Government has voted some towards the English sectional expenses, but I this sum will not fertilise the pockets of the exhibitors, as it appears already to have been the commission appointed by the mysterious Powers at South Kensington. I would not say that the exhibitions which have produced the feeling of Removal. the minds of many of our jurors and of Le Creusot. It is a remarkable an tion, and most beautiful as showing immense capacity of a single establishment—First Report. nothing in it which we do not p

after attending their communal schools are set to work at an early age. In support of this view of the similarity of education in the two countries, I may mention that it was found that an average number of 300 conscripts in 1,000 in the year 1866 were unable to read; and in 1864 only 239 in 1,000 recruits in England were unable to read; the advantage is therefore on the side of England, more particularly when you bear in mind the class from which our recruits are taken, and that in France the conscripts are taken by lot from the whole population. If we find these pupils of particular schools monopolising the direction of the whole of the manufacturing industries of France, we cannot but acknowledge the merit the schools must possess; and also we could not bring forward a better example of the immense value of education, and can form from this fact some idea of what results we might be able to obtain if the moral and intellectual education of our whole people were as well cared for as the scientific education of a small portion of the French nation appears to be. The Central School of Arts and Manufactures is specially designed to form engineers for all branches of industry, and for public works. Diplomas of Engineer of Arts and Manufactures are given by the Minister of State to those who pass in the first class, and certificates of capacity to those who pass in the second class. Foreigners are admitted as well as natives, and the course is for a period of three years, commencing at seventeen years. The course costs £32 per year, but in certain cases the State will grant a subvention to needy scholars. The Ecole Centrale trains principally engineers who enter the higher grades of the profession, to which their diploma gives them an acknowledged certificate of competency. The Ecole des Arts-et-Metiers has three schools established at Aix, Angers, and Chalons-sur-Marne, which are designed to form chiefs of workshops and workmen instructed for industries where iron and wood are worked. Every pupil must pass an examination, and must be from fourteen to sixteen years old. Only resident scholars are received, who pay £20 a year. The course is for three years, and the instruction is practical as well as theoretic. The theoretic instruction comprises arithmetic, elementary algebra, trigonometry, geometry, mechanics, drawing, and grammar. The practical instruction is given in four workshops of models and carpentry, casting, smiths' works, and mechanical construction. Scholars arrived at the end of their studies receive a certificate, and a silver medal is granted to those who show an exceptional merit. The Conservatoire des Arts-et-Metiers, where public gratuitous lectures on scientific subjects are given, is also a valuable institution to which we have no parallel in England. Here are kept models of all inventions; in the museum are 7,000 models of mechanical appliances, and in the library are 18,000 volumes on scientific subjects accessible without difficulty to any seeker of knowledge. By these institutions all the known information on all subjects is imparted to the students. Every new machine and new mechanical appliance is recorded and known. The scholar is taught how to apply science and mathematical education to the calling he follows, instead of being left, as in England, to acquire his knowledge in the uncertain school of experience. The student is thus started at a much earlier point than he is in England, where we have no scientific schools, and is saved much time and stumbling through inquiries which would have taken him long ago. Our English system has produced many glorious men, but the waste and wasteful toil might have been avoided if the sources of information of the past had been opened to the young. It has been done in England in my opinion, and the education of the upper working class, a work which I think is above the level of Mechanics' Institutions and so-called departments of science and art. It is a question which is of the earnest attention of Government, who

are as much bound to interest themselves in the industrial education of the country as they are to regulate the education of the surgeon or physician for the prosperity of the country, and hence the material comfort and well-being of the population, without which you can have no true moral advancement, depends on the measure of success you obtain in your industrial pursuits. As far as the powers of Mechanics' Institutes can be developed, they should be exercised in the scientific education of the working classes of this country; and special attention should be given to the forming of some organisation by which this education can be made more efficient. Although I have stated that the working class of this country is as well educated as that of France, it is not so in Prussia, where, in some degree, education is universal. But in France they are fully alive to the advantage of educating the labouring population, and are making great efforts in this direction. At Creusot Mr. Schneider has established schools under most able management, where, out of a total population of 23,000, there are 4,066 children in regular attendance at school. If we do not bestir ourselves earnestly we shall soon see our working population surpassed in superior education, as at present we see we are surpassed in higher education by the engineers and managers of the great industries of France. There is little doubt that England can still hold the first place at the head of manufacturing industry if she will only make use of the advantages she possesses. Our engineers must have the facilities for acquiring special knowledge which are attainable in other countries, and our people must have the education which will enable them to turn to the best advantage the directions of those whose province it is to guide them. With mineral resources unequalled and unbounded, with a climate the most congenial in the world, and a freedom of government which allows to every man the reasonable hope of attaining any position to which his talents and industry may entitle him—the countrymen of Shakespeare and Watt and Stephenson, if afforded the same advantages of education as are given to those nations which compete with them, can never fail to lead in the industrial advancement of the world."

There is only one statement I wish to correct. The Government has not voted "some £200,000 towards the English sectional expenses," but Parliament has voted £67,000 as part of a total estimated expenditure of £116,600—which I believe will not be reached—and by far the greater part of this sum is to defray expenses which have hitherto been borne by English or French Commissions inviting foreign countries to compete.—I am, &c., HENRY COLB.

Journal of the Society of Arts.

FRIDAY, AUGUST 2, 1867.

Announcements by the Council.

SOCIETY'S VISIT TO THE PARIS EXHIBITION.

Arrangements have been made for the visit of the members to the Universal Exhibition, 1867, as follows:—

The visit will extend from Monday, the 29th of July, Friday, the 16th of August.

A Reception Room has been provided for the use of the members at No. 43, Rue Saint Georges, where members can have their letters addressed, where they can write their letters, make appointments and arrangements, and where notices of any special matters connected with the visit will be suspended. Members are requested to register their names and addresses here on their arrival in Paris. Lists of Hotels and Lodgings will be provided.

Arrangements have been made by which the Members of the Society of Arts will, through the kindness of the proprietors, be admitted, on the presentation of their cards of membership, to inspect Imperial and Municipal establishments, factories, and workshops in the following list:—

His Excellency the Minister of Public Instruction has most kindly arranged for the Members visiting the Lycées of Paris, and has also further favoured the Society with tickets to view the exhibition of the works of the pupils in the Communal schools, and of the collections made by the Scientific Commission of Mexico.

The Director of the Imperial Mint (La Monnaie) has given instructions that members of the Society, when provided with their cards, which will be prepared for the purpose, shall be admitted to that establishment on Tuesdays and Fridays, at three o'clock.

The Director of the Imperial Observatory has arranged that the Members presenting their cards of membership at that establishment shall be admitted on Saturdays, between half-past two and four o'clock.

Monsieur le Sénateur, Prefect of the Seine, has politely promised to make proper arrangements for the visits of the members to the catacombs, sewers, and municipal establishments.

Through the kindness of M. Belgrand, the water engineer to the City of Paris, permission has been obtained for members to visit the Waterworks of the City of Paris at Menilmontant, on any day to the 5th August inclusive.

The Director of the Public Ways and Promenades of the City of Paris has thrown open the horticultural and other municipal establishments in his department, and has most obligingly tendered his assistance to the members.

M. Le Play, Commissaire-General of the Universal Exhibition, has very kindly expressed his desire to aid his members in any way in his power.

The following gentlemen and companies have politely opened their establishments to the Society:—

MM. J. F. Cail and Cie., engineers, Quai de Billy, No. 48, and Grenelle. Any day of the week, from 6 to 11 a.m., and from 12 to 5.

M. F. Barbedienne has furnished tickets of admission to visit his bronze foundry and workshops, 63, Rue de Lancry, on any day in the week, from 6 a.m. to 5 p.m.

MM. Barbezat and Cie., foundries, 58, Boulevard Prince Eugene, and 95 and 97, Rue Richard-Lenoir. Open to the members without restriction as to the day or hour.

MM. Ch. Christoffe and Cie., gold and silversmiths, 56, Rue de Bondy, will receive a party of the members on any day appointed by the Society, between 12 and 2 o'clock.

MM. Hachette and Cie.'s great publishing establishment will be open to members on any day, between half-past 8 and 11 o'clock, by presenting their cards to M. Fourret, a member of the firm.

M. Ch. Lahure, Imprimerie Générale, 9, Rue de Fleuras, on any day and at any hour, except between 12 and 2 o'clock.

MM. A. Chaix and Cie., printing establishment, 20, Rue Bergère, on Friday in each week.

MM. Mazaroz-Ribaillier and Cie., furniture manufacturers, Exhibition rooms, 20, Boulevard des Filles de Calvaire; manufactory, 4 and 6, Rue Ternaux Popincourt, freely open to the members.

The Directors of the Compagnie du Chemin de Fer de Paris à Orléans have given leave for the members to visit their new passenger station and goods station, on presenting their cards of membership to M. Renault, Chief Architect of the Company, No. 1, Boulevard de l'Hôpital; or to M. Preval, 42, Quai de la Gare; according as they desire to see the passenger station or the goods station.

The workmen's houses designed by H.I.M. the Emperor Napoleon III., and now in course of construction in concrete by Messrs. W. E. Newton (member of the Society) and E. C. Shepard, in the Avenue Daumesnil, near the Parc de Vincennes, may be inspected any day from 6 a.m. till 6 p.m. Mr. E. Newton, the resident engineer, is usually at the works from 10 till 4, but in his absence the foreman, M. Bourignon, or his deputy, will afford members any information they may require.

Nothing could exceed the politeness with which the various gentlemen have met the requests of the Society, and there is no doubt that in a day or two several other establishments will be added to the list.

Cards of membership, enabling members to take advantage of these arrangements, may be obtained on application to the Society's House, John-street, Adelphi, or at 43, Rue Saint Georges, Paris.

P. LE NEVE FOSTER, Secretary.

The following list of hotels will be found useful:—

IN THE NEIGHBOURHOOD OF THE TUILERIES.

Hôtel Maurice, 228, Rue de Rivoli.

" Windsor, 226, "

" Brighton, 218, "

" Wagram, 208, "

" Rivoli, 202, "

" du Louvre, 166, "

ON OR NEAR THE PRINCIPAL BOULEVARDS.

Grand Hôtel, 12, Boulevard des Capucines.

Grand Hôtel des Capucines, 37, Boulevard des Capucines.

Hôtel Scribe, 1, Rue Scribe.

" de Bade, 32, Boulevard des Italiens.

" du Tibre, 8, Rue du Helder.

" du Helder, 9, Rue du Helder, Boulevard des Italiens.

" Brezil, 16, Rue du Helder.

" de Lancastre, 22, "

" des Deux Mondes, 8, Rue d'Antin.

" des Etats Unis, 16, Rue d'Antin.

" de la Grande Bretagne, 14, Rue Caumartin.

RUE ST. HONORÉ, &c.

Hôtel de Lille et d'Albion, 223, Rue St. Honoré.

" St. James, 211, Rue St. Honoré.

" Choiseul, 241, Rue St. Honoré.

" du Danube, 11, Rue Richepance.

" Richepance, 14, Rue Richepance, near the Madeleine.

" de l'Amirauté, 20, Rue Duphot.

BOIS DE LA PAIX, PLACE VENDÔME, &c.

- Hôtel de la Paix, 22, Rue de la Paix.
 " Westminster, 11, Rue de la Paix.
 " Mirabeau, 8, "
 " Bristol, 5, Place Vendôme.
 " du Rhin, 4, Place Vendôme.
 " Castiglione, 12, Rue Castiglione.

PALAIS ROYAL AND BOURSE.

- Hôtel des Etrangers, 3, Rue Vivienne.
 Grand Hôtel de France et d'Angleterre, 72, Rue Richelieu.
 Hôtel d'Angleterre, 56, Rue Montmartre.
 " Bergère, 82, Rue Bergère.
 Grand Hôtel de la Marine, 3, Rue des Vieux Augustins.
 Grand Hôtel d'Albion, 20, Rue Bouloi.
 Hôtel Bouloi, 5, Rue Bouloi.
 Grand Hôtel de la Bourse, 15, Rue Nôtre Dame des Victoires.

NEIGHBOURHOOD OF THE NORTHERN RAILWAY.

- Hôtel de Chemin de fer du Nord, opposite the Railway Station.
 Grand Hôtel du Nord, 45, Rue Lafayette.
 Grand Hôtel de Strasbourg, 78, Boulevard de Strasbourg.
 Hôtel Violet, Passage Violet, Faubourg Poissonnière.

BETWEEN THE WESTERN RAILWAY STATION AND THE MADELEINE.

- Hôtel des Etrangers, 24, Rue Tronchet.
 " Tronchet, 22, "
 " Folkestone, 9, Rue Castellane.
 " Bedford, 17, Rue de l'Arcade.
 " de l'Arcade, 43, Rue de l'Arcade.
 " Navarin, Rue Navarin.

SOUTH SIDE OF THE SEINE.

- Hôtel d'Amsterdam, 59, Rue Saint André des Arts.
 " des Beaux Arts, 1, Rue Beaux Arts.
 " Bretagne, 20, Rue de Seine.
 " 46, St. André des Arts.
 " de Breteuil, 1, Rue Dauphin.
 " Clivia, 69, Rue Monsieur le Prince.
 " Suffren, Avenue Suffren, Champ de Mars.

RAILWAYS AND STEAMBOATS.—The terminus of the Auteuil and Exhibition Railway is at the Western Station, Place du Havre. 2nd class carriages only 50c., intermediate stations 40c. Trains leave the terminus at 27 minutes, and the Exhibition at 25 minutes past each hour; there is an extra up train at 5-57. The Circular Railway (Chemin de Fer de Ceinture) has stations all round Paris, and joins the preceding at Auteuil. The large omnibuses of the American Railway run from the Bourse, and carry passengers for the Exhibition to the Pont d'Alma. Steamboats run from the Place de la Concorde every quarter of an hour for the Exhibition. Landing stage on the Paris side of the Pont de Jena. Other steamboats ply between the Champ de Mars and the Ile de Billancourt. Landing stage on the lower side of same bridge.

NUMBERS OF HOUSES IN STREETS.—Even Nos. on right side, odd Nos. on left side of street, progressing in direction of the stream of the river, or commencing from the river in transverse streets.

POSTE RESTANTE.—Letters addressed "Poste Restante" to be applied for at the head post-office, 9, Rue Jean-Jacques Rousseau; but members can have their letters addressed to No. 43, Rue St. Georges.

CAB FARES IN PARIS.—Two kinds of cabs—single seat for two; double seat for four.

Fare either by the "hour" or the "course," at the option of the hirer ("course" any distance without stoppage).

Fares—Two-place cab, 2f. per hour; 1-50f. per course; four-place cab, 2-25f. per hour; 1-70f. per course.

Driver's usual gratuity, 5 sous per hour; 3 or 4 sous per course.

Extra charge between 12-30 night and 6 morning.

" " when taken from "Remise" (coach-house).

" " beyond the fortifications.

" " for luggage.

Ticket containing full particulars of authorised cabs, always to be given by the driver on entering his cab.
 OMNIBUS FARES.—30 centimes (3d.), inside; 15 centimes (1½d.), outside.

MONEY.—Gold:—20 francs, 10 francs, and 5 francs.
 Silver:—2 francs, 1 franc, ½ franc, and 20 centimes.
 Copper:—10 centimes (2 sous) = 1d.; 5 centimes (1 sou) = ½d. £1 = 25 francs, usual exchange.

ARTIZANS' VISIT TO PARIS.

Her Majesty's Government have granted to the Society of Arts, in aid of the fund now being raised by the Society for assisting workmen, specially selected from various trades, to visit and report on the Paris Exhibition, a sum of £500, conditional on the Society raising a like amount by public subscription.

The following is the list of subscriptions up to the present date:—

Total £952 15 0

Messrs. J. M. Johnson and Sons have kindly

placed at the disposal of the Council a number of their five-shilling English Catalogues of the Exhibition, sufficient to present each workman with a copy.

Subscriptions may be forwarded to the Financial Officer, at the Society's House.

The Council are now prepared to receive the names of any workmen recommended by their respective trades as fit and proper persons to undertake this important duty on behalf of their fellow workmen.

PRIZES FOR ART-WORKMEN.*

The Council of the Society of Arts hereby offer Prizes for Art-Workmanship, according to the following conditions:—

I. The works to be executed will be the property of the producers, but will be retained for exhibition, in London and elsewhere, for such length of time as the Council may think desirable.

II. The exhibitors are required to state in each case the price at which their works may be sold, or, if sold previously to exhibition, at what price they would be willing to produce a copy.

III. The awards in each class will be made, and the sums specified in each class will be paid, provided the works be considered of sufficient merit to deserve the payment; and, further, in cases of extraordinary merit additional awards will be given, accompanied with the medal of the Society.

IV. Before the award of prizes is confirmed, the candidates must be prepared to execute some piece of work sufficient to satisfy the Council of their competency.

V. *Bona-fide* Art-workmen only can receive prizes.

VI. Although great care will be taken of articles sent for exhibition, the Council will not be responsible for any accident or damage of any kind occurring at any time.

VII. Prices may be attached to articles exhibited and sales made, and no charge will be made in respect of any such sales.

VIII. All the prizes are open to male and female competitors, and in addition, as regards Painting on Porcelain, Cameo-cutting, Engraving on Glass, Decorative Painting, and Wall Mosaics, a second set of prizes, of the same amounts, will be awarded among female competitors. If a female desire to compete in the female class only, she must declare her intention accordingly. The originals of the works prescribed may be seen at the South Kensington Museum.

IX. Any producer will be at liberty to exhibit, either in his own name or through his workmen, any work or works as specimens of good workmanship, in the various classes, provided that the work or works be accompanied with a statement of the name or names of the artisans who executed their respective portions; and if the work or works be sufficiently meritorious, extra prizes will be given to the artisans who have executed them.

X. Artizans may, if they think fit, exhibit works executed by them after other designs than those stated above, in any of the classes. Such works may contain the whole or portions of the prescribed designs, and must

* The Worshipful Company of Salters contribute £10 annually to this prize fund. The Worshipful Company of Goldsmiths contribute £15 "for the encouragement of workmen in the precious metals." Particulars of the Goldsmiths' Company's prizes are given. The North London Exhibition prize consists of the interest of £167 7s. 3d., invested in the name of the Society of Arts, to be awarded by the Council "for the best specimens of skilled workmanship" at the Society's Exhibition of the works sent in for the prizes named above.

be of a similar style and character. Competitors must specify the class in which they exhibit. If the works be sufficiently meritorious extra prizes will be awarded.

XI. All articles for competition must be sent in to the Society's house on or before Saturday, the 21st of December, 1867, and must be delivered free of all charges. Each work sent in competition for a Prize must be marked with the Art-workman's name, or, if preferred, with a cypher, accompanied by a sealed envelope giving the name and address of the Art-workman. With the articles, a description for insertion in the catalogue should be sent. The works will be exhibited at the Society's House, and afterwards at the South Kensington Museum.

Casts may be seen at the Society of Arts, Adelphi, London, and the Schools of Art at Edinburgh, Dublin, Manchester, Glasgow, Birmingham, and Hanley in the Potteries.

Photographs and rough casts in metal, &c., may be purchased at the Society of Arts, John-street, Adelphi, at the prices named.

The plaster casts of the examples in classes 2 and 4 (except bas-relief 4a) may be obtained from Mr. Franchi, 15, Myddelton-street, Clerkenwell, E.C.; the other casts from Mr. D. Brucciani, Galleria delle Arti, 40, Russell-street, Covent-garden, W.C.

* The Council are happy to announce that several of the works which received first prizes in the competitions of 1863, 1864, 1865, 1866, and 1867, have been purchased by the Department of Science and Art, to be exhibited in the South Kensington Museum and the Art Schools in the United Kingdom.

FIRST DIVISION.

WORKS TO BE EXECUTED FROM PRESCRIBED DESIGNS.

For the successful rendering of the undermentioned designs in the various modes of workmanship according to the directions given in each case.

CLASS 1.—CARVING IN MARBLE, STONE, OR WOOD.

(a.) *The Human Figure*.—One prize of £15 for the best, and a second prize of £7 10s. for the next best, work executed in marble or stone, after part of a frieze of a chimney-piece, by *Donatello*, No. 5,795, in the South Kensington Museum; or a relieve in terra cotta, Amorini supporting an entablature; original in the South Kensington Museum, No. 11,940. Dimensions—Two-thirds the size of the cast (linear).—The design may be adhered to strictly or adapted to any architectural purpose.

[Cast—Fifteen Shillings; Photograph—One Shilling.]

(b.) *Ornament*.—One prize of £10 for the best, and a second prize of £5 for the next best work, executed in marble, stone, or wood after a carved chair-back in the South Kensington Museum. Dimensions—To be two-thirds of the cast (linear).

[Cast—Twelve Shillings. Photograph—One Shilling.]

(c.) *Ornament*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed in stone, after a *Gothic bracket* in the Architectural Museum. Dimensions the same as the cast. In this design the details may be improved by the introduction of small animals, and the human head may be changed according to the taste of the art-workman.

[Cast—Ten Shillings; Photograph—One Shilling.]

(d.)—One prize of £20 for the best, and a second prize of £10 for the next best, work carved in wood after a panel in carved oak. Original in South Kensington Museum, No. 274. Dimensions—Optional.

[Photograph—Sixpence.]

(e.)—One prize of £15 for the best, and a second prize

of £7 10s. for the next best, work carved in wood after the entablature of a chimney-piece carved in wood, in the South Kensington Museum, No. 85,764. Dimensions—Same size as original.

[Photograph—One Shilling.]

(f.) *Ornament*.—One prize of £10 for the best, and a second prize of £5 for the next best, work carved in wood after an *Italian picture frame* in the possession of Henry Vaughan, Esq. Dimensions optional.—This design may be adhered to strictly or adapted in such manner as the workman may think fit.

[Photograph—Two Shillings.]

(g.) *Ornament carved and gilt*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed in wood, carved and gilt after a *Chenail* in the South Kensington Museum, No. 6,497, of the period of Louis XVI. The work to be carved roughly in wood, then to be prepared in the white by a gilder, then carved or carved in the white by the carver, then to be gilt with mat and burnished gold. As such work may properly be executed by two persons, the prize will be apportioned as the judges may determine.

[Photograph—One Shilling.]

CLASS 2.—REPOUSÉ WORK IN ANY METAL.

(a.) *The Human Figure as a bas-relief*.—One prize of £5 for the best, and a second prize of £5 for the next best, work executed after the *Martelli Bronze Mirror Case*, No. 8,717, in the South Kensington Museum—dimensions, 6½ inches diameter; or a panel in low relief, the *Tap and Child*, in South Kensington Museum, No. 64,731. Dimensions—One-third of original.

[Cast of Mirror Case—Two Shillings; Photograph—One Shilling. Cast of Bas-relief, 3s. 6d.]

(b.) *Ornament*.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after a *tazza* in silver, date 1683, the property of Sir W. Trevelyan, Bart., now in the South Kensington Museum. Dimensions—The same as the model.

[Photograph—One Shilling.]

CLASS 3.—HAMMERED WORK, IN IRON, BRASS, OR COPPER.

Ornament.—One prize of £7 10s. for the best, and a second prize of £5 for the next best, work executed after a *knocker* in wrought iron, in the South Kensington Museum, No. 9,007.

If the work is executed in brass or copper, it should be rendered subject to the conditions of these metals, either as split and riveted or partly beaten from the sheet, and the awards will be made in view of these conditions. The work must not be covered with colour or any coating which masks the workmanship.

[Photograph—One Shilling and Threepence.]

CLASS 4.—CARVING IN IVORY.

(a.) *Human Figure in the round*.—One prize of £15 for the best, and a second prize of £10 for the next best, work executed after an ivory plaque of *Sileno and Amorini*, by *Piemonte*, No. 1,069, in the South Kensington Museum; dimensions—five inches greatest length, or after a *relievo* in marble, the *Virgin and Child*, No. 4,283 in the South Kensington Museum. Dimensions—To be reduced in height by one-third (linear).

[Cast of the Plaque—Two Shillings; and Photograph of the Virgin and Child—One Shilling each.]

(b.) *Ornament*.—One prize of £7 10s. for the best, and

second prize of £5 for the next best, work executed after a ivory crozier head, in the South Kensington Museum, No. 214.'65. Dimensions—The same as the cast.

[Cast—One Shilling.]

CLASS 5.—CHASING IN BRONZE.

(a.) *The Human Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a panel in low relief, the Virgin and Child, in the South Kensington Museum, No. 66'66.

A rough casting in bronze, on which the chasing must be executed, will be supplied by the Society at cost price.

[Plaster Cast—Three Shillings and Sixpence.]

(b.) *Ornament*.—One prize of £10 for the best, and a second prize of £7 10s. for the next best, work executed after a silver gilt missal cover, in the South Kensington Museum, No. 2,639.

[Photograph—One Shilling.]

CLASS 6.—ETCHING AND ENGRAVING ON METAL—NIELLO WORK.

Prizes of the Goldsmiths' Company.

Ornament.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after arabesques by Lucas Van Leyden, A.D. 1528. No. 18,968 in the South Kensington Museum. To be engraved the height of the photograph, and, if round a cup or goblet, repeated so as to be not less than nine inches in length when stretched out.

[Photograph—Sixpence.]

CLASS 7.—ENAMEL PAINTING ON COPPER OR GOLD.

(a.) *The Human Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a panel in low relief, the Virgin and Child, in the South Kensington Museum, No. 66'66. Ground to be blue. Dimensions—Half size of original.

[Photograph—One Shilling; Cast, Three Shillings and Sixpence.]

(b.) *Ornament*.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after the back of a plate, No. 8,428, in the South Kensington Museum. Ground to be blue. Dimensions—The same as the Photograph.

[Photograph—Sixpence.]

CLASS 8.—PAINTING ON PORCELAIN.

(a.) *The Human Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a photograph of a drawing by Raphael, No. 20 in the South Kensington Museum. Dimensions—The same as the Photograph. This work is to be coloured according to the taste of the painter.

[Photograph—Ninepence.]

(b.) *Ornament*.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after a photograph of ornament by *Aldegrever*, No. 2,118 in the South Kensington Museum, and coloured according to the taste of the painter, with a gold ground. Dimensions—Double the size of the Photograph (linear).

[Photograph—Sixpence.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 9.—DECORATIVE PAINTING.

(a.) *Ornament*.—One prize of £5, and a second prize of

£3, for a work, executed after a photograph of ornament by *Aldegrever*, in the South Kensington Museum, No. 2,118. Dimensions—length, 3 feet.

[Photograph—One Shilling.]

(b.) *Ornament*.—One prize of £5, and a second prize of £3, for a work, executed after a picture frame, in the South Kensington Museum, No. 7,820. Dimensions—5 feet by 3 feet 11½ inches, outside measure. The works to be executed on canvass, either with or without stretchers, in cool colours. Some lines of the mouldings may be gilt.

[Photograph—One Shilling and Sixpence.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 10.—INLAYS IN WOOD (MARQUETRY, OR BUEHL), IVORY OR METAL.

Ornament.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after a guitar inlaid with ivory, ebony, and mother-o'-pearl. The ornament to be of the same dimensions as the original, but may be applied to any object. No. 9,611 in the South Kensington Museum.

[Photograph—Sixpence.]

CLASS 11.—CAMEO CUTTING.

(a.) *Human Head*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a bust of *Clytie* in the British Museum—The head only.

[Cast of the Head—Five Shillings.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 12.—ENGRAVING ON GLASS.

Ornament.—One prize of £10 for the best, and a second prize of £3 for the next best, work executed after arabesques by Lucas Van Leyden, A.D. 1528. No. 18,968 in the South Kensington Museum. To be engraved the height of the engraving; and if round a glass or goblet, repeated so as not to be less than 9 inches long when stretched out.

[Photograph—Sixpence.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 13.—WALL MOSAICS.

Human Head.—One prize of £10 for the best, and a second prize of £7 10s. for the next best, work executed after a *Female Head* (over the lame cripple) in the cartoon of the "Beautiful Gate." The dimensions of the work should be regulated by the size of the tesserae proposed to be used, which size may be left to the choice of the artist. Although desirable, it is not necessary to execute the whole subject in actual mosaic. The original is at the South Kensington Museum. Tesserae of two sizes may be obtained from Messrs. Minton, Stoke-upon-Trent; Messrs. Maw and Co., Brosely, Shropshire; Messrs. Powell and Sons, Temple-street, Whitefriars; and Messrs. Jesso Rust and Co., Carlisle-street, Lambeth.

[Photograph—One Shilling.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 14.—GEM ENGRAVING.

(a.) *Human Head*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a cameo portrait of Savonarola, No. 7,541 in the

South Kensington Museum. Dimensions—The same as the cast.

[Cast—Sixpence.]

(b.) *Full-length Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a small Wedgwood medallion, No. 5,827 in the South Kensington Museum. Dimensions—The same as the cast.

[Cast—Sixpence.]

CLASS 15.—DIE SINKING.

Human Head.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a Wedgwood Medallion in the South Kensington Museum, No. 3,470. Dimensions—

[Photograph—Sixpence.]

CLASS 16.—GLASS BLOWING.

Ornament.—One prize of £7 10s. for the best, and a second prize of £5 for the next best, work executed after an original in the South Kensington Museum, No. 6,785. Dimensions—As given in the wood engraving.

[Photograph—Sixpence.]

CLASS 17.—BOOKBINDING.

(a.) *Bookbinding*.—One prize of £7 10s. for the best and a second prize of £5 for the next best, work executed in bookbinding, after a specimen in the South Kensington Museum, No. 16,460. The work to be bound should be some classical author of the size given. Dimensions—The same as the photograph.

[Photograph—One Shilling.]

CLASS 18.—EMBROIDERY.

Ornament.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed, either after *Two Angels* in an example in the South Kensington Museum, No. 1194/64, or an Italian Silk in the South Kensington Museum, No. 7,468, which may be adapted to a screen. Dimensions—According to the taste of the embroiderer.

[Photograph—German, Sixpence; Italian, One Shilling.]

CLASS 19.—ILLUMINATIONS.

Ornament.—One prize of £5 for the best, and a second prize of £3 for the next best, copy made from an Altar Card, attributed to Giulio Clovio, in the South Kensington Museum, No. 2,958, or from a MS. border, date 1450, No. 3,057, in the South Kensington Museum. Dimensions—One-half larger than the Photograph (linear).

[Photograph—Two Shillings.]

SECOND DIVISION.

CLASS 20.—WOOD CARVING.

(a.) *Human figure in the round, in alto or in bas relief. Animals or natural foliage may be used as accessories*. 1st prize of £25 and the Society's Silver Medal. 2nd prize of £15. 3rd prize of £10.

(b.) *Animal or still-life. Fruit, flowers, or natural foliage may be used as accessories*. 1st prize of £10. 2nd prize of £7 10s. 3rd prize of £5.

(c.) *Natural foliage, fruit, or flowers, or conventional ornament, in which grotesque figures or animals may form accessories, preference being given where the work is of an applied character for ordinary decorative purposes, as representing commercial value*. 1st prize of £10. 2nd prize of £7 10s. 3rd prize of £5.

(By order)

P. LE NEVE FOSTER, *Secretary*.

Proceedings of the Society.

FOOD COMMITTEE.

ADULTERATION OF FOOD.

Through the kindness of Lord Stanley, the following information has been furnished to the Committee in reference to the laws concerning the adulteration of food in Norway and Denmark:—

NORWAY.

Criminal Code, Cap. 21, par. 3, sec. 1.

Anyone who, with intent to defraud, sells goods having the same to be adulterated, shall be liable to punishment with imprisonment, or hard labour of the 4th class (1.).

Criminal Code, Cap. 21, par. 4.

Anyone who with intent to defraud sells articles of food adulterated with matter injurious to health shall be punished with hard labour of the 5th class.

Criminal Code, Cap. 21, par. 5.

If the offence named in section C be committed in regards food or medicines, or anything appertaining to the sustenance of man, and the offender is aware that any portion of the same be composed of matter injurious to health, whether it be employed during its manufacture or be added subsequently, shall be punished with hard labour of the 4th (2) or 5th class.

Be the offender a merchant, or person earning his livelihood by preparing or vending such goods, he shall be liable to lose his license; and should any one's health be impaired, or life be sacrificed to the culpability of the offender, he shall, in the first instance, be liable to hard labour of the 2nd class (3) or 3rd class (4), and in the latter instance to hard labour of the 1st (5) or 2nd class.

CONCERNING THE USE OF FALSE WEIGHTS OR MEASURES.

The manufacture and sale of proper weights and measures is under control publicly instituted; and all weights and measures must consequently be adjusted, and subsequently stamped. At least once during each year, as often as there may be reasons for so doing, it shall be the duty of the head of the police force of each town to inspect such weights and measures in use.

For further particulars see paragraphs 18—22 of the Law of July 28th, 1824, copies of which are subject to Penalties therein are still in force.

Criminal Code, Cap. 2, par. 4.

Whosoever shall be guilty of feloniously counterfeiting the stamps or marks used by the authorities for marking or stamping weights and measures shall be punished with hard labour of the 4th or 5th class.

Criminal Code, Cap. 2, par. 5.

Whosoever uses weights or measures knowing them to be counterfeited, as above cited, shall be liable to hard labour of the 4th or 5th class.

Criminal Code, Cap. 2, par. 6.

Whosoever shall manufacture articles, specified in paragraph 4, namely, stamps or marks, but without criminal intent, shall be liable to a fine or imprisonment.

Criminal Code, Cap. 21, par. 4.

Whosoever, with intent to defraud, uses for purposes of trade or otherwise, weights or measures of improper dimensions, shall be punished with hard labour of the 5th class.

Whosoever, without intent to defraud, uses unadjusted weights or measures for purposes of trade, or otherwise, shall be liable to a fine and the confiscation of the goods thus weighed or measured; and whosoever uses weights or measures which he knows to have been adjusted, but which have subsequently been tampered with, shall be liable to a fine and punished with the circumstances.

weights and measures shall be deemed unfit for use; should, however, the party to whom they are promised to readjust the same, this restriction may be modified.

In accordance with ancient and hitherto enforced regulations, all fish, and preparations of the same, were used to be inspected, and subsequently stamped, as to quality, and barrels were opened with a view to inspect quantity therein contained. This inspection was formerly obligatory, but by the decree of September 15, the necessity of such inspection has been removed. The town of Bergen there are still regulations for inspection of herrings for exportation.

PUNISHMENTS REFERRED TO IN THE FOREGOING.

- 1. From six months to three years.
- 2. Three years, and not exceeding six years.
- 3. Seven years, and not exceeding twelve years.
- 4. Six years, and not exceeding nine years.
- 5. For life.

DENMARK.

Copenhagen, April 25, 1867.

[Y LORD,—In compliance with the instructions contained in your lordship's despatch, No. 3, of the 2nd inst., I have the honour to transmit to your lordship, with copy, together with translation, of two paragraphs of the Danish Criminal Code, referring to frauds in the use of false weights and measures and by adulteration of articles of food.

I should add that there is a local board established in Copenhagen, whose duty it is to attend to all matters concerning the sanitary conditions of the town, and whose power extends to the examination of every article of food brought to market.

I have, &c.,

(Signed) F. C. FORD.

o Lord Stanley.

Paragraph 277 of the Danish Criminal Code.

Any one who fraudulently makes false measures or weights, or alters proper measures or weights, also any one who uses such false instruments for the purpose of weighing others, shall be punished with imprisonment, with bread and water, for a period not less than five years, or with labour in the House of Correction for a period not exceeding two years. Under special circumstances of an aggravated nature, as also when the crime is repeated, the punishment may be inflicted for a period not exceeding six years' imprisonment. Any one who uses weights or measures in the exercise of his trade which are not legally adjusted, or which, by time or use, have become deteriorated, shall for the first offence be liable to a penalty not exceeding 100 Rix-dollars, 12s. 3d., and in case of repetition to a higher penalty imprisonment.

Paragraph 278.

Likewise, as stated in the first part of the foregoing paragraph, any one who adulterates goods (articles of food), or who fraudulently furnishes goods or other articles with a public stamp or mark with a view of making them appear real and good, or who fraudulently procures such stamp or mark on articles which are not fit for use; also anyone who without right applies the stamp or mark of others upon articles which are of inferior quality to that which the stamp or mark would indicate, all be punished. In case the articles upon which the stamp or mark of other persons is applied without their sanction are not of very inferior quality, the punishment stipulated in the second part of the preceding paragraph shall be applicable, and proceedings will only be taken against the offending party should the party who has been wronged request it.

The above law shall likewise be applicable with regard to minor adulterations which may be practised by retailers, and by which any one may suffer only a trifling loss.

Proceedings of Institutions.

HUNSLET MECHANICS' INSTITUTION.—The report for the last year, in reviewing the progress of the Institution, states that there is no cause for despondency. Since the date of the last report, the rules of the Institution have undergone a thorough revision, and are now reprinted; and the committee venture to assert that they consider them calculated to promote a more healthy condition than existed heretofore. The number of members on the 31st December, 1866, was 336, and they may be classed as follow:—82 paying at the rate of 10s. per annum, 119 at 8s. per annum, 101 at 6s. per annum, 34 at 4s. per annum. When compared with the number of members on the books on the 31st December, 1865, there is an increase of 12. The number of persons who have entered and re-entered during the year is 180, while 102 have withdrawn. The quarter commencing with October experienced a considerable addition to the numbers—73 having entered during that month alone. But this is sufficiently accounted for by the increased advantages offered to members wishing to join the evening classes, and partly, too, by the attractions supplied in the lectures and entertainments. Still, out of a population of upwards of thirty-three thousand, and chiefly composed of the working classes, the numbers ought to be far larger. The committee think they possess all the machinery necessary to render a Mechanics' Institution a successful one, lacking only one matter—the support of the artisans themselves. This is a cause of great regret. It must not, however, be forgotten that the generally prosperous state of trade in this district has made large demands on the labour of those who might otherwise be expected to flock to the Mechanics' Institution. The subscription of members amount to £94 17s. 5d., this sum being less than in 1865; the principal falling off occurring during the summer months, but partly also owing to many members being in arrears. As regards the educational department, the day schools and the whole of the classes are in full and satisfactory operation. The total number on the books is 275:—Day school—Boys, 39; girls, 36; preparatory, 88; total, 163. Evening classes—Male, 45; female, 55; drawing, 12; total, 112. These figures are not quite so high as the previous year. But the most cheering feature in this department is the remarkable success which has attended the male evening classes. The number in actual attendance in the October quarter was 71. At the close of the last Session for the evening classes, the committee held a written examination of those pupils who had been in attendance, and who thought proper to come forward. The result was the award, through the munificence of the President and a few gentlemen interested in evening class instruction, of thirteen prizes in books to the successful candidates. At the examinations of the Society of Arts, and of the West Riding Educational Board, to each of the successful candidates the committee awarded a prize. The number of competitors at the latter was considerably smaller than those of the previous year, and this is partly attributed to the fact that the Board discontinued the practice of offering prizes to pupils attending day-schools. When the evening classes closed for the summer months, the committee endeavoured to keep up the connection with their pupils by providing means for their recreation and amusement outside, but they failed in securing a field sufficiently central and in other respects eligible. The drawing class continues to do its work regularly, there being twelve in attendance. Prizes were awarded by the Science and Art Department to John Goldthorp, W. Harrison, Wesley North, and C. Swales; and R. J. Milligan, W. North, and C. Swales, having previously passed in three subjects, obtained their certificates. For the first time, too, thirteen of the students have had the privilege of sending their year's drawings to the Department; and Walter Best and C. C. Braithwaite obtained a prize each; while

G. Bedford, C. Swales, Jos. Lilley, Jos. Goldthorp, and John Goldthorp received honourable mention. In this branch the committee have awarded three additional prizes; and they cannot help expressing their conviction that the students in drawing require much more encouragement than they have hitherto received; and they feel persuaded that a few well-selected prizes offered by gentlemen in the neighbourhood could not fail to have a most beneficial effect. There are now about 2,900 volumes in the library, 87 of which have been added during the past year. The monthly circulation for the last quarter averaged about 550, while during the summer months it was not more than 310. A new catalogue has been prepared. Several lectures and entertainments were introduced during the year, and though the lectures have been of a superior character, the committee have still to regret that they were not better attended. At the annual *soirée*, presided over by the late Mayor (H. Oxley, Esq.), though on a Saturday evening, the attendance of the working classes was in no way better than on former occasions. In a pecuniary point of view the committee are thankful to have to report that the subscriptions to the *soirée* fund have exceeded all former ones, and they have been enabled to pay £50 towards the reduction of the debt on the building, as well as £20 for the year's interest, and £20 to the general fund, leaving a balance of £10 5s. 11d. for the purchase of new books, &c., for the library. The general account shows that the income has been £218 15s. 1½d.

EXAMINATION PAPERS, 1867.

The following are the Examination papers set in the various subjects at the Final Examination held in April last:—

(Continued from page 578.)

NAVIGATION AND NAUTICAL ASTRONOMY.

THREE HOURS ALLOWED.

SECTION I.

1. The arc of the great circle joining the poles of two great circles measures the inclination of the planes of the circles.

2. Define the polar or supplemental triangle of a spherical triangle, and prove that the sum of an angle of the primitive triangle and a side of the supplemental triangle is equal to two right-angles.

3. Express the tangent of half the side of a spherical triangle in terms of the angles of the triangle.

SECTION II.

1. When one side of a spherical triangle is a quadrant, obtain expressions connecting the other sides and angles.

2. Having given any two sides of a spherical triangle, and a triangle opposite to one of them, find the other two angles and the third side. Explain the ambiguity in this case.

3. Obtain an expression for the angular radius of the circle which passes through the angular points of a given spherical triangle, in terms of its angles or sides.

SECTION III.

1. Find the compass-course and distance from A to B. Given—

Lat. $\left. \begin{array}{l} A 57^{\circ} 18' \\ B 38^{\circ} 15' \end{array} \right\} \begin{array}{l} \text{N} \\ \text{S} \end{array}$ Variation 2 pts. E. Long. A $33^{\circ} 27'$ } S
Deviation 3° W. B $33^{\circ} 27'$ }

2. May 18, at noon, a point of land in lat. $57^{\circ} 33' \text{ N.}$ Long. $127^{\circ} 16' \text{ E.}$ bore by compass $S. \frac{1}{2} \text{ W.}$ Variation, $1\frac{1}{2}^{\circ} \text{ W.}$, deviation, $9^{\circ} 55' \text{ E.}$ (Ship's head E. by N.). Afterwards sailed by compass during the next 24 hours, as follows:—

K.	h.	Courses.	Wind.	Leeway.	Deviation.
83	0	S.S.E.	N.W.	$\frac{1}{2}$	$0^{\circ} 56' \text{ W.}$
55	8	S. $\frac{1}{2} \text{ W.}$	S.E.	2	$3^{\circ} 40' \text{ W.}$
74	6	N.E. $\frac{1}{2} \text{ E.}$	N. b. W.	$1\frac{1}{2}$	$10^{\circ} 30' \text{ E.}$

Required the latitude and longitude in on May 19, at noon.

SECTION IV.

1. July 1, 1867, the observed meridian altitude of Eridani under the S. Pole was $21^{\circ} 48' 40''$, the index error was $+1' 10''$, and the height of the eye was 20 ft. Required the latitude.

2. July 9, 1867 p.m., in longitude $148^{\circ} 45'$, the mer. alt. of Moon's L.L. was $46^{\circ} 10' 10''$. (Zenith N. moon.) Index error $-1' 55''$, and height of the eye 15 feet. Required the latitude.

3. May 26, 1867, p.m., in latitude $81^{\circ} 31' \text{ N.}$, the alt. of Antares (east of mer.) was $15^{\circ} 49' 45''$; at the same time the chronometer showed 8h. 46' 56" (R.M. May 26, p.m., at Greenwich.) The index error was $3' 55''$, and the height of the eye was 17 feet. Required the longitude.

On May 2, at Greenwich, noon, the chronometer was too slow at G.M.T. $1' 8''$, and its daily rate was $7.6''$ losing.

SECTION V.

1. Define course, and show that—

$$\text{Tan. course} = \frac{\text{Diff. long.}}{\text{Mer. diff. lat.}}$$

2. Write down and prove the formulae employed in middle latitude sailing.

3. Obtain expressions for finding the latitude and longitude of the vertex in great-circle sailing.

SECTION VI.

1. If P be the pole of the heavens, Z the zenith, S the place of a heavenly body in the celestial sphere, what are the sides and angles of the triangle PZS?

2. Prove the rule for finding the latitude by equal altitudes of the sun observed before and after passing the meridian.

3. Show that the error in time corresponding to an error in the observed altitude is the least when the heavenly body is on the prime vertical.

SECTION VII.

1. April 3rd, 1867, at 7h. 10m. a.m., in lat. $59^{\circ} 17' \text{ N.}$ long. 170° W. , the sun bore by compass $S. 78^{\circ} 45' \text{ E.}$ (true head N.E. b. E., dev. $10^{\circ} 55' \text{ E.}$) when the observed sun's L.L. was $15^{\circ} 13' 20''$, the index error was $-1' 10''$, and the height of the eye was 12 feet. Required the variation.

2. May 14th, 1867, at 9h. 45m. p.m., in lat. $61^{\circ} 1' \text{ N.}$, and long. $0^{\circ} 15' \text{ W.}$, the following observations were made:—

Obs. alt. Regul.	Obs. alt. Moon's L.L.	Obs. alt. N.L.
$39^{\circ} 16' 50''$	$34^{\circ} 55' 50''$	$43^{\circ} 39' 30''$
Index error $-1' 35''$	$-1' 40''$	$-1' 10''$

The height of the eye was 25 feet. Required the longitude.

SECTION VIII.

Describe the errors to which the sextant is liable, and how the index error is found.

PRINCIPLES OF MECHANICS.

THREE HOURS ALLOWED.

1. What is the difference between the investigation of Statics, Dynamics, and Cinematics? Illustrate your marks by simple examples.

2. State the principal laws of motion. What are the conditions under which they are true?

3. State and prove the parallelogram of velocities. This proposition a mechanical or geometrical one?

EXAMPLE.—Velocities of 5 and 7 are simultaneously given to a small body, in directions making a known angle: investigate an expression for the actual velocity. Find the results when the angle is 80° , 60° , or 30° . What must the angle be when the velocity is 6?

4. What principle do we assume to determine the action on impulsive action between bodies? What is the place between elastic bodies during impact, and what is the difference from inelastic bodies?

EXAMPLE.—A body weighing 12 lbs., moving with a velocity of 200 yards per minute, overtakes a body weighing 30 lbs., moving with a speed of 50 yards per minute. What is the common speed after impact, if the bodies be perfectly elastic? What are their respective motions if each be perfectly elastic?

State the difference between a simple and compound pendulum; and explain the terms "centres of oscillation and suspension."

EXAMPLE.—What is the distance of these points in a pendulum which oscillates in $2\frac{1}{2}$ seconds?

EXAMPLE.—A clock gains 3 seconds a day when reversed to the bottom of a shaft. Find the decrease in the force of gravity.

Investigate the formula for the space described by a body thrown vertically upward or downward, and acted on by gravity.

EXAMPLE.—A stone is dropped into a well, and the splash is heard 5 seconds afterwards. Sound travels 100 feet per second. What is the depth of the well?

How many systems of pulleys are usually found to be employed? What allowances are practically made for the size and rigidity of the ropes?

EXAMPLE.—A wheel and axle weigh 3 cwt.; the radius of the wheel is 3 feet, and that of the axle 8 inches; the radius of the axle is $1\frac{1}{2}$ inches; the latter is of wrought iron, and rests upon a bearing of cast-iron (coefficient of friction = .075.) Find what power will just support or raise a ton.

If friction be neglected, what is the power required?

8. Define the term "centre of gravity." Show how to find it in some regular bodies; also in a system of heavy particles, connected by rods whose weight is neglected.

EXAMPLE.—Out of a round boiler plate, 8 feet in diameter, is cut a circular hole, 1 foot in diameter, which just touches the rim of the plate. How far is the centre of gravity of the rest of the plate from the centre of the hole?

If a piece of brass were to replace the iron that has been removed, where would the centre of gravity of the hole be?

N.B.—The comparative weights of brass and iron are 14 to 13.

9. A body moves about a fixed horizontal axis. Investigate the time in which it oscillates.

EXAMPLE.—A trap-door, 6 feet long and 4 feet broad, made to swing slightly about a horizontal axis. Find the time of its doing so.

10.—Show that fluids press equally in all directions. Hence prove that a floating body displaces as much fluid as is equal to its own weight.

EXAMPLE.—A diamond ring weighs 70 grains; but when weighed in water 65 grains; the comparative weights of a diamond, of gold, and of water, are as 7, 33, 31. Find the weight of the diamond in the ring.

11. Show how to make and graduate a common thermometer. What scales are commonly used? Express 00° Fahrenheit in each of these scales.

12. "The elastic force of air at a given temperature varies as the density." How has this statement been experimentally proved?

13. Describe one or more varieties of the barometer.

A bad barometer is twice compared with a good one. Its readings are 59.85, 30.16, when they ought to be 30.61, 31. What is the true reading when it appears to be 30.56?

14. A heavy fluid is contained in a vessel, which is made to revolve round a vertical axis. Show that its surface assumes the form of a paraboloid.

15. How is the work of steam computed in a high-pressure engine?

PRACTICAL MECHANICS.

THREE HOURS ALLOWED.

1. Explain what is meant by the *pitch circle* of a toothed wheel. Upon what principle are bevil wheels constructed?

2. Show how the crank and connecting rod are employed in an ordinary locomotive to communicate motion from the piston of the engine to the driving wheel. If the lengths of the crank and connecting rod be respectively 10 inches and 5 feet, what is the distance of the piston from the middle of its stroke when the crank has moved half-way between the dead points?

3. Describe the reversing motion of three pulleys and three bevil wheels, as commonly adopted in planing machinery.

4. What is meant by aggregate motion in machinery? Explain the differential screw. A toothed wheel gears with two parallel racks, whereof one is fixed and the other moveable; if the centre of the wheel be moved through a given space, how far will the moveable rack be shifted.

5. Describe the general arrangement of the wheel work in an eight-day clock. How is motion given to the hour hand? What is the principle of the escapement?

6. Show how change wheels may be employed to alter the relative angular velocities of two parallel axes. What use is made of change wheels in the screw cutting lathe?

7. Point out the use of conical pulleys in changing continuously the relative angular velocity of two parallel axes. If the axes were perpendicular and intersecting, instead of being parallel, what contrivance would you employ to effect a like variation?

8. Explain the working of an atmospheric steam-engine; point out its defects, and describe generally the single-acting condensing engine invented by Watt.

9. Describe the manner in which the steam acts in a locomotive engine, sketching the slide-valve and steam passages.

10. What is the principle of the parallel motion of a beam-engine.

11. Draw the indicator diagrams which you would expect to obtain from a double-acting condensing engine, and also from a high-pressure engine. How would these diagrams assist you in ascertaining the working horse power of each engine?

12. Describe generally some form of direct-acting engine for driving a screw-propeller.

(To be continued.)

PARIS EXHIBITION.

A new and interesting contribution to the Exhibition has just arrived from Siam; the King of that country has sent nine highly-ornamented pirogues, as specimens of the most perfect maritime construction produced in his dominions. The boats are very graceful in form, and attract much attention.

Amongst the many complaints made against the awards of the juries, that of the watchmakers of Besançon attracts perhaps most attention. While Paris, London, and Geneva receive gold medals, Besançon is only awarded silver ones. The people of Besançon claim to have nearly driven all other makers out of the French markets, the imports of watches having fallen from 200,000, in 1845, to 71,000 in 1866; and say that out of 382,000 watches entering into the trade of France last year, 305,000 were made at Besançon and in the mountains of the Doubs, where 30,000 men are engaged in the trade; the value of the products being about £800,000. The Besançon watchmakers, however, speak only of quantity and not quality; and it is well known that the action of the jury in the case of the English watchmakers was most severe. To meet such demands as that of Besançon, and, indeed, to justify certain awards that have been made, two kinds of awards seem to be required, one for excellence of workmanship, the other for commercial ability. An increase in the number of useful cheap articles is a benefit to the community, but a million of common watches could not be equal in the eyes of the jury to one first-rate chronometer. The whole system

of recompenses is surrounded with difficulties, and the short period allowed for the action of the juries on this occasion no doubt complicated the case; it was simply impossible to do the work well in the time given. The appointment of a special commission to revise the list of awards is, to a certain extent, a proof of the validity of the complaints made.

The Imperial Commission has again reduced the price of the season tickets, which are now charged 40 francs for ladies as well as gentlemen. There is little doubt that the original price of 100 francs was too high, and it would appear that the late charge of 60 francs has not been found to answer; but at any rate, the principle of diminishing the price as the season advances seems fair, and is likely to be successful. The number of visitors to the Exhibition has fallen off greatly during the last few weeks, but this is not surprising; the provincials cannot leave their homes at present, there is a lull after the excitement of the awards; and, lastly, the weather has been exceedingly unfavourable. There is no doubt that August and September will bring crowds to the Champ de Mars. Those who come soon will be likely to find more room than those who put off their visits.

A meeting of Foreign Commissioners to the Exhibition took place the other day at the Club-house in the park, when the Comte d'Avila, representing Portugal, was called upon to preside, and it was proposed that an address should be presented to the Emperor, for the reception which the Commissioners had met with from the Imperial Government and Commission; the proposition was carried by acclamation.

A society has been formed, under the auspices of the Imperial Commission, for the encouragement of fisheries, and maritime and fluvial agriculture, by means of publications, periodic exhibitions, by the loan of instruments to fishermen and others, and by the organization of associations for watching over fisheries, preventing poaching, and supplying rivers with fish; a committee of organization, consisting of MM. Gassier, Lacombe, Pujol, and Roger Desgenette, has been appointed with full powers.

Manufactures.

BOILER EXPLOSIONS.—The engineer's report of the Midland Steam Boiler Inspection and Assurance Company, presented at the tenth half-yearly meeting, and dated 27th February last, says that, up to December 31st, 1866, there were 890 boilers under inspection and 1,300 under assurance, making a total of 2,190 boilers under the care of the company; and that there has been no explosion of any boiler under the care of the company during the past half-year, nor indeed during the whole of the past year, excepting one of a very trivial character. During the five years the company has been in operation, there has been only one serious claim upon the guarantee fund for an assured boiler, and even that would have been prevented if the warning given of the danger had been attended to. Two other serious casualties have happened to boilers under inspection in the five years, one before opportunity of internal examination had been given, and the other after the danger had been reported. During the past year there have been made 11,523 inspections of boilers, and of these 1,380 have been inside and 1,867 in the flues. During the year, 1,168 reports have been sent to owners, pointing out matters needing attention. By far the most frequent cause of injury to boilers has been found to be corrosion, especially externally, where the plates have come in contact with the brickwork; needless danger is also often caused by the over-weighting of the safety-valves. Very great mischief is allowed to be done by want of timely repair, or by the straining of repair hastily executed. Records have been obtained of 70 boiler

explosions, during the year 1866, in Great Britain, causing the death of 85 and the injury of 100 other persons. This cannot be considered the total number, as some may have attracted so little attention as not to be heard of beyond their immediate neighbourhood. The class of boiler which has most frequently exploded, and has caused the most loss of life, is the Cornish or two-flued boiler, internally fired, and the records show that this otherwise safe and economical boiler requires attention to certain well-established details of construction, especially in the strengthening of tubes of large diameter with rings; and also that the shell is liable to corrode, and that corrosion is as dangerous to this as to any other class of boiler. The greatest number of explosions have happened to boilers employed in iron-works and collieries, or mines, and this is hardly to be wondered at, as the number of boilers so employed must far exceed those used for any other purpose; and, as steam was early introduced into these industries, many of the boilers have been used longer than at any other work. The causes which have led to the greatest number of the explosions have been the faulty construction before alluded to and corrosion. In nearly every case the cause was readily to be discovered, and the evil could have been avoided or remedied had the boilers been subjected to proper periodical inspection. The 2,190 boilers under the care of the company are used for the following purposes:—917 in collieries, 1,096 in iron-works, and 177 in other works or mills. They are of the following general description, 1,868 fired externally, and 327 fired internally. The chief points noticed in inspection of the boilers during the past year, and mentioned in the reports to owners, may be classed under the two general heads of those relating to the construction, form, setting, material and workmanship, and others relating to the fittings or working of the boilers. Under the former head, attention has been called to the need of strengthening rings for the large internal tubes, so often the cause of explosion. The weakness of the ends has several times been detected. Dangerous weakness has often been noticed from large manholes without strengthening rings, and these very frequently further weakened by corrosion, or by the strain of the clamps too tightly screwed to prevent the leaking of badly-made joints. It has been necessary to have some domes strengthened with stays, to compensate for the large holes of 3, 4, or 5 feet diameter, cut out of the shell, although it would have been easier to have left it in with a small hole in the centre for the passage of the steam. Several forms of boiler have been pointed out as needlessly complicated where only a slight advantage has been gained at the sacrifice of durability and facility of cleaning. Many seam-rips have been discovered in boilers made of extreme length for burning the gas from blast furnaces, and it has been recommended that the evil should be avoided by having two or more shorter boilers set in the same straight flue. Extreme difficulty has been met with in flue examinations from the utter disregard of provision for cleaning out or passing along the flues. Many boilers of small diameter are set at great expense, with narrow inaccessible wheel flues, where a plain shaft flue would have been better. The external flues of Cornish boilers have been found particularly narrow, and being rounded to match the shell of the boiler, are most difficult and dangerous to traverse, and yet no part of the boiler requires more careful examination to detect corrosion than where the plates touch the brickwork. Several boilers have been noticed with iron of such bad quality as to crack in the body of the plate and through the rivet holes after working only a few months; and rivetting has been detected where the rivet iron has been so bad, and the workmanship so careless, that the heads could be broken off with the blow of a light hammer. Nothing could be greater folly than to attempt to work boilers of such material and workmanship. Perhaps nothing causes greater annoyance to boiler owners than the difficulty of

getting repairs properly executed, as boilers are frequently permanently injured by repairing with heavier plates than needed, and straining the old plates up to them; and also by carelessly altering the position of seams, so as to destroy the crossing of joints. With regard to the points relating to the working of the boilers, it has been necessary to urge the imprudence of using boilers of great age, as in some that have worked for upwards of thirty years the plates and rivets have been found so much deteriorated as to make it impossible to calculate what pressure they would bear, rendering them very uncertain and dangerous. The needlessly heavy fires under many boilers have been noticed, where the fuel was piled up to within a few inches of the boiler, allowing no room for proper combustion, and greatly injuring the plates by over-heating a small area over the fire, instead of allowing the flame to circulate as far as possible beyond the bridge. This evil is generally associated with another, quite as injurious, and that is regulating the fire by opening the fire door instead of by using the damper, so that the already over-heated plates are exposed to the contracting influences of a stream of cold air. The most frequent evil pointed out is external corrosion from the leaking of fittings bolted instead of rivetted, or from rain allowed to penetrate beneath the brickwork, and yet corrosion could be most easily avoided by proper vigilance. Safety valves are repeatedly found over-loaded to prevent leaking, when the faces require grinding, and sometimes temporarily repaired with sheet lead inserted between the faces. An over-weighted safety valve is a wilful courting of danger. Many fusible plugs have been noticed as defective, consequently leading to a false feeling of security. Self-feeding apparatus has been found deranged, so that too much confidence should not be placed in it. Many boilers have been found without pressure gauges or with the gauges incorrect or badly placed. The general condition, however, of the boilers under the company has improved.

Colonies.

CULTIVATION OF BEET IN NEW SOUTH WALES.—The cultivation for the sake of the spirit and sugar of beet-root is attracting attention in this colony. A patent for the manufacture of spirits from beet-root has been taken out there. It is said that by the last mail steamer the patentees received from France a package of 200lbs. of the seed of the genuine sugar beet.

QUEENSLAND SHIPPING STATISTICS.—It appears that during the year 1866, whilst 569 vessels, of 197,665 tons, were entered inwards at the various ports of the colony, 556 vessels, of 195,991 tons, were cleared outwards. The following table shows the nationality of the vessels with which the trade of the colony is chiefly carried on:—

	Inward vessels.	Outward vessels.
Great Britain.....	37	9
Germany	5	—

Publications Issued.

INVENTORS AND INVENTIONS. By HENRY DIRCKS, C.E. (*H. and F. N. Spon.*) This work is divided into three parts. The first takes up the philosophy of invention, considered strictly in relation to ingenious contrivances tending to facilitate scientific operations, to extend manufacturing skill, or to originate new sources of industry. The second treats of the rights and wrongs of

inventors, particularly as affected by the influence of patent monopoly, legally and politically examined. And the third gives an account of the early inventors' inventories of secret inventions, employed from the 13th to the 17th century in substitution of Letters Patent.

Notes.

WATER SUPPLY.—The following letter, addressed to the *Lancet*, gives some interesting particulars relative to the purity of water for domestic purposes:—"We have recently made an examination of the Loch Katrine water as supplied to Glasgow. The water was taken from one of the mains in Glasgow. The result of the examination is calculated to surprise many persons, for the Loch Katrine water has often been cited as a model water. We find that 1,000,000 parts of this water contain putrescible organic matter corresponding to 0.13 parts of ammonia. The numbers for the New River water, which supplies some parts of London, are 0.09, and for the Southwark and Vauxhall Company's water, taken from the Thames, high up the river, 0.20. The Caterham water, and also a spring in the greensand, near Dorking, contain no putrescible organic matter. These facts point to the propriety of seeking for a supply of drinking-water from springs, and not from rivers and lakes. We are, &c., J. Alfred Wanklyn, Ernest T. Chapman, Miles H. Smith. London Institution, Finsbury-circus, July 1st, 1867."

MUSEUM OF THE ARCHIVES OF FRANCE.—The Museum of the Archives of the Empire was opened recently, and, with the fine old historic mansion in which it is contained, will make another addition to the curiosities of Paris. The rooms in which the museum is placed were formerly the apartments of the Dukes of Soubise, and the walls are decorated with forty pictures by the best painters of the eighteenth century. Amongst the contents of the museum itself is the series of Chancery registers, from the sixteenth century to the present time.

CROP OF BEETROOT FOR SUGAR.—Speaking of the great uncertainty attached to the cultivation of beetroot, the *Journal des Fabricants de Sucre* of the 25th July states that, notwithstanding the fact that the heavy rains and great cold at the commencement of the season had injured the prospects of the crop, it has now been saved by the same unseasonable rains and cold at a later period. The plants are being slowly but surely developed, and are thus in a good condition to encounter the great heat which may be expected, and which, if it come, will find the soil, the leaves, and the root admirably prepared to encounter it. Only a month ago a crop could hardly be looked for, such was the backward state and miserable appearance of the plants; but the beetroot is now growing luxuriantly and vigorously, and a favourable result may be expected, although a large portion of the crop is still backward, and will not be able to offer much resistance to any very great heat or prolonged drought. The fears of a large deficit entertained at the commencement of the season may now be dismissed, and, at least, an average crop may be looked for. As to the saccharine richness of the plant, which is so important an element for the manufacturer, as upon it depends a very large portion of the quantity of sugar produced, nothing can as yet be said, and six weeks or two months will have passed before a fair opinion can be given.

Journal of the Society of Arts.

FRIDAY, AUGUST 9, 1867.

Announcements by the Council.

SOCIETY'S VISIT TO THE PARIS EXHIBITION.

The visit of the members to the Universal Exhibition, 1867, is now taking place, as follows:—

The visit will extend from Monday, the 29th of July, to Friday, the 16th of August.

A Reception Room has been provided for the use of the members at No. 43, Rue Saint Georges, where members can have their letters addressed, where they can write their letters, make appointments and arrangements, and where notices of any special matters connected with the visit will be suspended. Members are requested to register their names and addresses here on their arrival in Paris. Lists of Hotels will be provided.

Arrangements have been made by which the Members of the Society of Arts will, through the kindness of the proprietors, be admitted, on the presentation of their cards of membership, to inspect Imperial and Municipal establishments, factories, and workshops in the following list:—

His Excellency the Minister of Public Instruction has most kindly arranged for the Members visiting the Lycées of Paris, and has also further favoured the Society with tickets to view the exhibition of the works of the pupils in the Communal schools, and of the collections made by the Scientific Commission of Mexico.

The Director of the Imperial Mint (La Monnaie) has given instructions that members of the Society, when provided with their cards, which will be prepared for the purpose, shall be admitted to that establishment on Tuesdays and Fridays, from twelve to three o'clock.

The Director of the Imperial Observatory has arranged that the Members presenting their cards of membership at that establishment shall be admitted on Saturdays, between half-past two and four o'clock.

Monsieur le Sénateur Hausmann, Prefect of the Seine, has politely promised to make proper arrangements for the visits of the members to the catacombs, sewers, and municipal establishments.

Through the kindness of M. Belgrand, the water engineer to the City of Paris, permission has been obtained for members to visit the Waterworks of the City of Paris at Menilmontant.

The Director of the Public Ways and Promenades of the City of Paris has thrown open the horticultural and other municipal establishments in his department, and has most obligingly tendered his assistance to the members.

M. Le Play, Commissaire-General of the Universal Exhibition, has very kindly expressed his desire to aid the members in any way in his power.

The following gentlemen and companies have politely opened their establishments to the Society:—

MM. J. F. Cail and Cie., engineers, Quai de Billy, No. 48, and Grenelle. Any day of the week, from 6 to 11 a.m., and from 12 to 5.

M. F. Barbedienne has furnished tickets of admission to visit his bronze foundry and workshops, 63, Rue de Lancry, on any day in the week, from 6 a.m. to 5 p.m.

MM. Barbezat and Cie., foundries, 58, Boulevard Prince Eugene, and 95 and 97, Rue Richard-Lenoir. Open to the members without restriction as to the day or hour.

MM. Ch. Christoffe and Cie., gold and silversmiths, 56, Rue de Bondy, will receive a party of the members on any day appointed by the Society, between 12 and 2 o'clock.

MM. Hachette and Cie.'s great publishing establishment will be open to members on any day, between half-past 8 and 11 o'clock, by presenting their cards to M. Fourret, a member of the firm.

M. Ch. Lahure, Imprimerie Générale, 9, Rue de Fleurus, on any day and at any hour, except between 12 and 2 o'clock.

MM. A. Chaix and Cie., printing establishment, 20, Rue Bergère, on Friday in each week.

MM. Mazaroz-Ribaillier and Cie., furniture manufacturers, Exhibition rooms, 20, Boulevard des Filles de Calvaire; manufactory, 4 and 6, Rue Ternaux Popincourt, freely open to the members.

MM. Thiboumery et Cie., Chemical Works, 190, Rue Croix-Nivert.

M. A. Piver, manufacturer of perfumery, 91, Rue de Flandre.

The Directors of the Compagnie du Chemin de Fer de Paris à Orléans have given leave for the members to visit their new passenger station and goods station, on presenting their cards of membership to M. Renault, Chief Architect of the Company, No. 1, Boulevard de l'Hôpital; or to M. Prevel, 42, Quai de la Gare; according as they desire to see the passenger station or the goods station.

The workmen's houses designed by H.I.M. the Emperor Napoleon III., and now in course of construction in concrete by Messrs. W. E. Newton (member of the Society) and E. C. Shepard, in the Avenue Daumesnil, near the Parc de Vincennes, may be inspected any day from 6 a.m. till 6 p.m. Mr. E. Newton, the resident engineer, is usually at the works from 10 till 4, but in his absence the foreman, M. Bourignon, or his deputy, will afford members any information they may require.

Cards of membership, enabling members to take advantage of these arrangements, may be obtained on application to the Society's House, John-street, Adelphi, or at 43, Rue Saint Georges, Paris.

P. LA NEVE FOSTER, Secretary.

The following list of hotels will be found useful:—

IN THE NEIGHBOURHOOD OF THE TUILERIES.

Hôtel Meurice, 228, Rue de Rivoli.

 " Suffren, Avenue Suffren, Champ de Mars.

RAILWAYS AND STEAMBOATS.—The terminus of the Auteuil and Exhibition Railway is at the Western Station, Place du Havre. 2nd class carriages only 50c., intermediate stations 40c. Trains leave the terminus at 27 minutes, and the Exhibition at 25 minutes past each hour; there is an extra up train at 5-57. The Circular Railway (Chemin de Fer de Ceinture) has stations all round Paris, and joins the preceding at Auteuil. The large omnibuses of the American Railway run from the Bourse, and carry passengers for the Exhibition to the Pont d'Alma. Steamboats run from the Place de la Concorde every quarter of an hour for the Exhibition. Landing stage on the Paris side of the Pont de Jena. Other steamboats ply between the Champ de Mars and the Ile de Billancourt. Landing stage on the lower side of same bridge.

NUMBERS OF HOUSES IN STREETS.—Even Nos. on right side, odd Nos. on left side of street, progressing in direction of the stream of the river, or commencing from the river in transverse streets.

POSTS RESTANTE.—Letters addressed "Poste Restante" to be applied for at the head-post-office, 9, Rue Jean-Jacques Rousseau; but members can have their letters addressed to No. 43, Rue St. Georges.

CAB FARES IN PARIS.—Two kinds of cabs—single seat for two; double seat for four.

Fare either by the "hour" or the "course," at the option of the hirer ("course" any distance without stoppage).

Fares—Two-place cab, 2f. per hour; 1-50 f. per course; four-place cab, 2-25 f. per hour; 1-70 f. per course.

Driver's usual gratuity, 5 sous per hour; 3 or 4 sous per course.

Extra charge between 12-30 night and 7 morning.

" " when taken from "Remise" (coach-house).
 " " beyond the fortifications.
 " " for luggage.

Ticket containing full particulars of authorized cabs always to be given by the driver on entering his cab.
OMNIBUS FARES.—30 centimes (3d.), inside; 1s. times (1½d.), outside.

MONEY.—Gold:—20 francs, 10 francs, and 5 francs:—5 francs, 2 francs, 1 franc, ½ franc, and 1 centimes. Copper:—10 centimes (2 sous)=1d.; 5 times (1 sou)=½d. 21 = 25 francs, usual exchange.

ARTIZANS' VISIT TO PARIS.

Her Majesty's Government have granted the Society of Arts, in aid of the fund now being raised by the Society for assisting artisans, specially selected from various trades, a visit and report on the Paris Exhibition to the sum of £500, conditional on the Society making a like amount by public subscription.

Total £958 0 0

Messrs. J. M. Johnson and Sons have kindly placed at the disposal of the Council a number of their five-shilling English Catalogues of the Exhibition, sufficient to present each workman with a copy.

Subscriptions may be forwarded to the Financial Officer, at the Society's House.

The Council are now prepared to receive the names of any workmen recommended by their respective trades as fit and proper persons to undertake this important duty on behalf of their fellow workmen. A certain number have already been selected, and some of them are now in Paris.

Proceedings of Institutions.

BANBURY MECHANICS' INSTITUTE.—At the last half-yearly meeting, held March 21st last, the report presented spoke of the continued prosperity of the Institute. At the commencement of the half-year the Committee determined to arrange for a more systematic course of lectures during the winter months than in previous years, and the attendance has been a decided improvement upon past years. It appears that at the previous half-yearly meeting a question was raised, whether, from the absence of the mechanic element, the simple title of Institute, or Literary Institute, would not be more correct; and one of the earliest subjects considered by the committee was how the absence of mechanics could be accounted for, and what plan, if any, could be adopted to induce a larger number of these to unite themselves with the Institute. Negotiations were opened with the committee of the Recreation Society—the largest number of artisans in the town, and an offer was made, which, if accepted by the members of this Institute, would have brought a large increase to the number, and so removed the ground of complaint, as a very fair proportion of the members would have been strictly mechanics. At a full meeting of the committee the proposal was accepted, but at an extraordinary general meeting of the members of the Institute it was rejected, and so the matter rests. Books to the amount of £11 have been purchased for the library. During the half-year now elapsing the committee has been requested to take charge of a scientific library given to the town by Mr. Samuelson, and has devoted a room to this purpose, and they hope to receive from other gentlemen of the neighbourhood donations of scientific books, so as to constitute this a valuable library of reference. The balance-sheet shows that the total receipts have been £102 6s. 7d.; and payments £89 5s. 11d.; leaving a balance in hand of £13 0s. 8d.

BELFAST PEOPLE'S LITERARY INSTITUTE.—The report for last year says that there has been an increase in the number of subscribers; in January, 1866, there were 268, and in January, 1867, there were 288. The educational classes have been eminently successful, some of them having as many as 50 members; it is believed that they have been the means of inducing not less than 80 subscribers to join the Institute. They comprise English, book-keeping, arithmetic, mathematics, and French. The English class has been largely attended and highly appreciated by the pupils. The book-keeping class was opened for the first time, and has been most popular. The mathematical class has also been well attended. The Committee have at length obtained possession of the premises in Queen-street, belonging to the late Mechanics' Institute. They have consequently taken steps to have the entire premises let to the best advantage, and trust to have a still more favourable report to make at the next meeting. The treasurer's report shows that £12 has been received as donations during the past year; and the Committee intend continuing their efforts in this direction.

EXAMINATION PAPERS, 1867.

The following are the Examination papers set in the various subjects at the Final Examination held in April last :—

(Continued from page 593.)

MAGNETISM AND ELECTRICITY.

THREE HOURS ALLOWED.

1. Give some experimental illustrations of magnetic attraction, repulsion, and induction.
2. What are the *isoclinical lines*? Describe the distribution of terrestrial magnetism.
3. How are the errors of a ship's compass ascertained? and by what means may the *quadrantal deviation* be corrected?
4. Explain the phenomena of diamagnetism; and mention some substances by which this property is most powerfully manifested.
5. In what manner are magnetic and electric energy directionally related? Illustrate the relation experimentally.
6. What are the leading properties of an electrified body?
7. To what phenomenon in light and heat is electrical induction analogous?
8. Explain the construction and action of an electrophorus.
9. What is meant by the potential of a voltaic current?
10. Explain the construction of Daniell's battery, and the reasons for its constancy.
11. Explain the construction of a thermopile, and state its chief uses.
12. What evidence does a thermo-electric element afford of the dynamic nature of electricity?
13. Explain the structure and action of the electric organs in some animal.
14. What relations exist between a voltaic current and muscular contraction?
15. Describe the construction of the Morse telegraph.
16. Describe the construction and use of a relay.
17. Explain the structure of some efficient submarine cable.
18. Explain the mode of testing a "fault" in an electric cable and assigning its locality.

LIGHT AND HEAT.

THREE HOURS ALLOWED.

GEOMETRICAL OPTICS.

1. Enunciate the law of the ordinary refraction of light at the surface of a transparent medium. When we look directly down through the surface of water at objects below the surface, show how to find their real depth compared with their apparent depth. Explain how a straight rod, placed obliquely in water, appears to an eye above it to be broken at the surface of the water.
 2. Show what is the correct form for the mirror of a light-house, supposing the flame of the lamp to be very small. If the flame is large, what effect has that circumstance on the beam of reflected light? Show the construction of Gregory's reflecting telescope, with the positions of the images.
 3. If a small diverging pencil of rays falls directly on a concave spherical surface of a refracting medium, show how to find the focus from which the refracted pencil diverges. Apply the result to find the effect of concave lenses on diverging pencils. Show how the images of objects seen through concave lenses appear diminished in magnitude.
 4. Explain the construction of the Galilean telescope. Show how its magnifying power arises, and state its disadvantages.
- PHYSICAL OPTICS.
5. State the evidence by which it is concluded that light is propagated with intervals which differ, for the different colours of the solar spectrum. What is the value, approximately, of the luminiferous interval in green light.

Describe some method of measuring the luminiferous interval for a given colour.

6. Explain the construction of the *double image* rhomb. Show how a polariscope is formed in the French instruments by means of a double image rhomb for the polarizer, and another double image rhomb for the analyzer. What advantages and disadvantages have these forms of polariscopes.
7. Explain what is meant by the diffraction of light. If a telescope, in focus to show distinctly the image of a distant luminous point, has a piece of wire gauze placed before the object-glass, describe the appearance seen on looking through the eye-glass. How are the appearances in this and similar cases explained?
8. When a plate of a *biaxial* crystal, cut perpendicularly to the line bisecting the angle between the optic axes, is placed between the polarizer and analyzer of the polariscope, describe the appearances witnessed when the eye is near the plate, for different relative positions of the polarizer and analyzer. Give the names of some biaxial crystals.

HEAT.

9. Explain what is meant by the *conduction* of heat. Describe some method of determining the conducting powers of solid bodies. Give the names of some of the substances which have the best conducting powers for heat in their order.
10. Explain the cause of the discrepancies in the readings of the spirit, the mercurial, and the air thermometer. Which of these has been generally taken for the standard thermometer to which the others are compared? Give the reasons for that choice.
11. Describe a method of measuring the elastic force of the vapours of liquids at high temperatures, and generally when it is greater than that of the atmosphere. How have many of the gases been brought to the liquid and some to the solid state?
12. Explain the construction and mode of action of the *high pressure* steam engine. Show the circumstances in which it becomes the most advantageous form of steam engine.

CHEMISTRY.

THREE HOURS ALLOWED.

No candidate is allowed to answer more than three questions in each division.

FIRST DIVISION.

1. How is chlorine usually prepared? What impurities is it liable to contain?
2. What are the chief constituents of coal gas? How can each of them be obtained in a pure state?
3. Is atmospheric air a compound or a mixture? Describe experiments by which you could prove the correctness of your opinion?
4. Describe and explain a process for the preparation of sulphuretted hydrogen? Describe by equations the action of the gas in the following compounds, viz.: potassic hydrate, ferric chloride, arsenious acid.
5. How are nitrates detected when present in large quantity? How are mere traces of them detected?
6. What weight of air is needed for the complete combustion of a ton of carbon?

SECOND DIVISION.

1. What are the common constituents of pig iron? How is pure iron obtained on a large scale?
2. What is the most abundant ore of antimony? What are its most characteristic chemical reactions?
3. Describe the preparation and properties of the several substances denoted by the formula Hg Cl^2 , $\text{Hg}^2 \text{Cl}^2$, Hg O , Hg S ?
4. A white precipitate is obtained by the addition of hydrochloric acid to a solution containing metallic salts. What may the precipitate contain; and how would you examine it?
5. How is bleaching-powder made? What compounds does it contain? How would you judge of its quality?

is lime separated from magnesia?

THIRD DIVISION.

Describe the manufacture of acetic acid; also the residue of the acid?

is glycyrine obtained from tallow? Give its and chief reactions?

iven sample of cane sugar is suspected to contain crystallisable sugar. How would you ascertain such is the case?

Describe the preparation of tannin from gall-nuts? the action of dilute sulphuric acid in tannin?

How would you separate starch and woody fibre?

Describe the process of dyeing by indigo?

MINING AND METALLURGY.

THREE HOURS ALLOWED.

Describe the various ores of zinc, and their usual occurrence.

From what source is the principal supply of silver?

How would you determine the amount of lead contained in a sample of rich galena?

Describe the method of smelting iron ores in the furnace.

Describe the process employed for smelting lead ores, the addition of metallic iron.

Name the most important ores of iron, and give several compositions.

What do you understand by a mineral vein?

Describe the mechanical preparation of copper ores.

How is coke prepared from small coal or slack?

Describe the method of securing a pit with iron.

By what process is steel usually manufactured in country.

Describe the Patio process of amalgamation.

(To be continued.)

TECHNICAL EDUCATION.

The following report has been made by the Schools Inquiry Commission:—

We, the Commissioners appointed to inquire into the education given in schools not comprised within the scope of your Majesty's two recent Commissions of Inquiry into the state of Popular Education, and of certain public schools, bearing date respectively the thirtieth day of June in the twenty-second year, and the eighteenth of July in the twenty-fifth year of your Majesty's reign, humbly submit to your Majesty the following report:—

Our attention has been incidentally called to the evidence considered to be afforded by the International Exhibition at Paris, of the inferior rate of progress recently made in manufacturing and mechanical industry in England compared with that made in other European countries. It has been stated to us that this alleged inferiority is due in a great measure to the want of technical education, and we have therefore thought it desirable to ascertain from many eminent English jurors in this department whether they agree with this opinion.

We think it expedient at once to report to your Majesty the answers which we have received to our inquiry on this point. Although they have an obvious bearing on the propriety of encouraging to a large extent the study of physical science in our schools, and especially in schools used by those classes which are probably destined to the pursuit of manufacturing industry (a question which had already engaged much of our attention, and to which we hope more fully to advert in our general report), yet we have not considered that an inquiry into technical education came directly within the scope of our Commission, nor could we now undertake it without interposing a longer delay in making our

report than we should wish. But considering the great importance of the subject, we venture to suggest for the consideration of your Majesty's Government whether a special inquiry into the state and effects of technical education abroad, and particularly in France, Germany, and Switzerland, should not be instituted, in whatever manner may appear to your Majesty's Government best calculated to obtain full and accurate information about it. Witness our hands and seals this second day of July, 1867.—Taunton, Chairman; Lyttelton; W. F. Hook; F. Temple; Anthony W. Thorold; Thomas Dyke Acland, jun.; Edward Baines; W. E. Forster; P. Erle; John Storrar; H. J. Roby, Secretary.

To this report is appended the following correspondence:—

From Dr. Lyon Playfair to Lord Taunton, Chairman of the Schools Inquiry Commission.

[This letter has already appeared in the *Journal* of June 7th.]

(CIRCULAR.)

Schools Inquiry Commission, 2, Victoria-street, S.W.,
May 30, 1867.

SIR,—I am instructed by Her Majesty's Schools Inquiry Commissioners to send to you a copy of a letter lately addressed to their chairman by Dr. Lyon Playfair, and to request that you will favour them by stating whether you agree with the substance of that letter.—I have, &c., H. J. Roby.

The above circular was sent to some eminent jurors and others. The answers which have been received are from the following gentlemen. The name of the subject with which they were respectively connected is added in italics:—

Dr. David Price. (*Iron.*)

Prof. Tyndall, F.R.S., Royal Institution, Albemarle-street. (*Physics.*)

J. E. McConnell, C.E. (*Locomotives.*)

James Young, Esq., of Limefield by West Calder. (*Chemical Manufactures.*)

J. Scott Russell, Esq., F.R.S. (*Naval Architecture.*)

Captain Beaumont, R.E., Junior United Service Club. (*General Machinery.*)

Peter Graham, Esq., of Jackson and Graham's, Oxford-street. (*Furniture and Carpets.*)

E. W. Cooke, R.A. (*Glass and Artistic design.*)

E. Huth, Esq., of Leeds. (*Woollens.*)

W. Spotten, Esq., Belfast. (*Flax.*)

R. Mallet, Esq., C.E. (*Engineering.*)

Rev. Canon Norris, M.A. (*Education.*)

Prof. Frankland, F.R.S., Royal Institution, Albemarle-street. (*Chemistry.*)

John Fowler, Esq., Pres. I.C.E.

Warrington W. Smyth, Esq., F.R.S., School of Mines, Jermyn-street. (*Mining.*)

A. J. Mundella, Esq., Nottingham. (*Hosiery, &c.*)

1. From Rev. Canon Norris, M.A., late one of her Majesty's Inspectors of Schools.

June 3, 1867.

MY LORD,—During my four weeks' work at Paris as the English juror of Class 89 (primary instruction), I had more than one conversation with English jurors of other classes on the subject to which Dr. Lyon Playfair's letter has invited your Lordship's attention.

Two questions are raised by that letter:—

1. Is England really losing her advanced position in those industries which involve the application of science to production?

2. If so, is it due to our comparative backwardness in the teaching of what, for shortness sake, is called applied science?

In reply to the first question I must say that, without any exception, it seemed to be the impression of those with whom I spoke on the subject. Only with special reference to one of the grounds on which Dr. Playfair bases his judgment I would venture to suggest some caution. I do not think that a comparison of the awards made to the several nations by the International Jury is a trustworthy evidence of the respective merits of those nations.

The upshot of my experience of the jury work was this, that these international exhibitions had already outgrown the conditions under which the justice of such awards could be considered at all certain.

However, Dr. Playfair's opinion is by no means made to rest on this ground only. He speaks from a large and independent knowledge of the subject; and, as I have said, I found the opinion universal among those with whom I spoke.

I come then to the second question:—Assuming that we are making less industrial progress than France, Austria, and Prussia, how far is this due to England's backwardness in the technical education of her artisans?

And here, very deliberately, I must confess that my examination of the things sent from Austrian, French, and Prussian schools, compared in my own mind, not with what England sent (for we were not at all fairly represented), but with my own knowledge of what England might have sent, led me to believe that while in the matter of primary education we were (to say the least) well abreast of those three nations, yet in the matter of higher instruction, of all that tends to convert the mere *workman* into the *artisan*, Austria, France, and Prussia were clearly passing us.

I have, &c.,

J. P. NORRIS.

The Lord Taunton, &c., &c.

2. From John Tyndall, Esq., F.R.S., Professor of Physics in the Royal School of Mines.

June 3, 1867.

SIR,—I hardly think that an Exhibition in Paris furnishes the means of accurately testing the comparative merits of English and French education.

The simple inconvenience of transport tends to render England worse represented than France.

Still on other grounds I would express a general concurrence in the views of Dr. Playfair. The facilities for scientific education are far greater on the Continent than in England, and where such differences exist, England is sure to fall behind as regards those industries into which the scientific element enters.

In fact, I have long entertained the opinion, that in virtue of the better education provided by continental nations, England must one day—and that no distant one—find herself outstripped by those nations, both in the arts of peace and war. As sure as knowledge is power this must be the result.

I am, &c.,

JOHN TYNDALL.

H. J. Roby, Esq., &c., &c.

3. From Edward Huth, Esq.

Oakfield Lodge, Huddersfield,
June 3, 1867.

SIR,—I have read with much interest the letter of Dr. Lyon Playfair, addressed to Lord Taunton, on the industrial or want of industrial education in England, a copy of which was enclosed in your favour of the 31st of May. The great experience and high authority of Dr. Playfair might almost be sufficient to prove his case. I, as a humble individual, can only say that I agree with him *in toto*.

Having closely examined the woollen textile fabrics during the Exhibition in 1851, and having acted as juror for these fabrics in the Exhibition of 1862, as well as the present one in Paris, I had opportunities of comparing the progress that has been made by various countries in this important branch of industry.

I am sorry to say that, although we may still be unsurpassed in many of our productions, we no

that pre-eminence which was accorded to us in the Exhibition of 1851.

Although an industry which has attained a considerable state of perfection does naturally not advance ten years as rapidly as the one which was at that period less fully developed, I fear that the enormous strides that have of late been made by our continental rivals—France, Belgium, Prussia, and Austria, will make it daily more difficult for our woollen manufacturers to hold, not only their former prominent position, but even in many cases to maintain their present one.

It is high time that not only the Government, but that every individual who loves his country should make thorough inquiries into the causes of such a state of things.

Like Dr. Playfair, I made it a point during my stay in Paris to converse with many English as well as foreign jurors on this point.

I found my (for a long time previously entertained) convictions entirely confirmed, that it is the want of industrial education in this country which prevents our manufacturers from making that progress which other nations are making. From all I could see and hear I found both masters and foremen of other countries much more scientifically educated than our own.

This, however, is not all. The workmen themselves of other countries have a far superior education to ours, many of whom have none whatever. Their productions show clearly that there is not a man working a machine, but that brains sit at the loom and intelligence stands at the spinning wheel.

Seeing and feeling the results of this as thoroughly as I do, you must permit me for one moment to try beyond the contents of Dr. Playfair's letter, and of what use is an industrial scientific education to a working population if they have not had a good elementary education to begin with?

This, I know, opens a wide and fruitful subject of controversy, but one which one day must be grappled with, and the sooner this is done the better it will be for England.

Voluntary education has done much, but the progress is too slow, and the great question is, whether compulsory education must be resorted to.

This, I know, will grate harshly on many an ear, but so it did on mine some years ago.

Seeing what it has done for other countries, and being convinced that a good general education is the great secret of their rapid strides in art and manufacture, I have entirely changed my opinion, and I am glad to say that the many eminent men in different states of life with whom I have conversed in Paris on this subject are all of the same opinion.

Let wiser heads than mine find out the right way to accomplish this and to make it acceptable to all.

Let this national elementary education once be established throughout the country, and you have a nucleus for scientific industrial schools, in nearly all our manufacturing towns at least, in our Mechanics' Institutions, wherever such institutions are properly conducted.

Pray excuse me for going so far beyond the inquiry contained in your letter; my only plea for doing so is the deep interest I feel in education and the advancement of all branches of industry in England.

I have, &c.,

EDWARD HUTH.

H. J. Roby, Esq.,
Schools Inquiry Commission, London.

4. (Second Letter.)

Oakfield-lodge, Huddersfield,
July 1st, 1867.

SIR,—A short absence from home prevented me from returning the enclosed sooner.

To avoid misunderstanding I desire to make only one remark in explanation of what I say about Mechanics' Institutions forming a nucleus for scientific industrial schools.

Of course I do not mean to say that our Mechanics' Institutions could do the work of the higher industrial schools, which I should like to see established by Government for those who are able to pay a reasonable price for the instruction they receive in them.

But if a general system of sound elementary education were to be introduced in this country, our Mechanics' Institutions could take a far higher standing in the promotion of scientific instruction to the really working population, instead of being compelled, as they now are, to confine themselves almost exclusively to elementary instruction.

I have, &c.,

EDWARD HUTH.

H. J. Roby, Esq., &c., &c.

5. *From Edward Frankland, Esq., F.R.S., Professor of Chemistry in the Royal School of Mines.*

Royal College of Chemistry, 315, Oxford-street, W.
June 4, 1867.

SIR,—I am favoured with your communication of the 31st ult., enclosing a letter addressed by Dr. Lyon Playfair to the Chairman of Her Majesty's Schools Inquiry Commissioners, and requesting me to state whether I agree with the substance of that letter. In reply I beg to say that Dr. Lyon Playfair's communication substantially expresses my own convictions in regard to the matters therein mentioned.

As a juror in Class 44 of the present Paris Exhibition, I was not only forcibly struck by the want of evidence of progress in the different branches of chemical manufactures carried on in Great Britain, but still more so at the great advances made by other nations, but more especially by Germany, France, and Switzerland, in respect of such manufactures since the year 1862, when, as a juror in the corresponding class, I had also on opportunity of comparing the chemical manufactures of different nations.

I quite agree with Dr. Playfair in referring this want of progress in the manufactures of this country chiefly to the almost utter lack of a good preparatory education for those destined to take part in industrial pursuits. This great defect in the school and college education of England affects the masters and managers of our factories even more deeply than the workmen themselves. The former have but rarely had any opportunities of making themselves acquainted with the fundamental laws and principles of physics and chemistry; they therefore find themselves engaged in pursuits for which their previous education has afforded them no preparation, and hence their inability to originate inventions and improvements. It is true that such men not unfrequently imagine themselves inventors, and the yearly files of patent specifications abound with instances of their so-called inventions. The great loss of time and money attending these futile patents would be rendered impossible by a very moderate, if accurate, knowledge of chemical and physical science.

In the polytechnic schools of Germany and Switzerland the future manufacturer or manager is made familiar with those laws and applications of the great natural forces which must always form the basis of every intelligent and progressive industry. It seems that at length this superiority in previous training is more than counterbalancing the undoubted advantages which this country possesses in raw material.

I have, &c.,

E. FRANKLAND.

H. J. Roby, Esq., &c., &c.

6. *From John Fowler, Esq., Pres. I.C.E.*

2, Queen-square-place, Westminster, S.W.,
June 5, 1867.

SIR,—I find it difficult to answer your question precisely in the terms in which you put it.

I do not quite agree with Dr. Playfair that a comparison can be usefully made between Exhibitions so nearly together in time as those of 1862 and 1867, nor that "little inventiveness" and "little progress" in the peaceful arts have been lately made by this country.

With these reservations, however, I may say that I

agree generally with that which may be considered the substance of the letter, viz., that foreign nations have made greater manufacturing progress than England since the Exhibition of 1851.

This, in fact, was the opinion which I publicly expressed on the 8th May, at the annual dinner of the Institution of Civil Engineers, and I have been glad to see a confirmation of it by Dr. Playfair and others.

I am, &c., JOHN FOWLER.

H. J. Roby, Esq., Schools Inquiry Commission,
2, Victoria-street.

7. *From James E. McConnell, Esq., C.E.*

Dean's-yard, Westminster, S.W.,
June 7, 1867.

SIR,—I have read Dr. Lyon Playfair's letter to Lord Taunton on the subject of the position which England occupies in the great industrial competition in Paris.

I agree with Dr. Playfair in his views generally, and am satisfied as to the comparatively small progress we have shown since 1862, and the great advance which continental nations have made during that period.

In the class of which I was juror for England (No. 63) I made a very careful examination and comparison of our locomotive engines, carriages, and railway machinery, apparatus, and material as shown by this country, with the same articles exhibited by France, Germany, and Belgium.

I am firmly convinced that our former superiority either in material or workmanship no longer exists; in fact, there are engines shown there made in France and Germany equal to those of the best English makers.

It requires no skill to predict that, unless we adopt a system of technical education for our workmen in this country, we shall soon not even hold our own in cheapness of cost as well as in excellence of quality of our mechanical productions.

I found that on the Continent there are now a number of workmen's schools established, in which a clever mechanic can qualify himself for any scientific position in his business.

In England our Mechanics' Institutions are more like reading clubs. Classes are neglected, and in consequence when a good workman is selected for a foreman's place, he is generally found wanting in technical knowledge.

We have treated our workmen too much like a machine, but this must be remedied if we are to maintain our ground.

Having for about 25 years superintended large numbers of English workmen, I can speak on this point practically.

Fully impressed with the great importance of this subject, I invited several of my brother jurymen and exhibitors to meet at our hotel in Paris, to consider the best course to adopt in the matter. At one of these meetings we had the pleasure of Dr. Playfair's attendance.

I may mention that I hear a movement has already begun to draw the attention of the public in England to the subject, and sums of money have been offered by individuals to assist the object. It appears to me, however, that Government should take the matter in hand, and the public funds should be forthcoming to establish these technical schools, not in London, but in the districts where the operations requiring such knowledge are being carried on.

Thus there ought to be mining schools in South Wales, Staffordshire, and Durham, and machinery and engine schools in like manner placed in Manchester, Glasgow, &c., &c.

It will afford me much pleasure, and I shall be ready to be of service if required in this matter in which I feel the greatest interest, and know to be nationally of vital importance.

I have, &c.,

JAMES E. MCCONNELL.

H. J. Roby, Esq., &c., &c.

8. From Capt. Frederick Beaumont, R.E.

71, Avenue Champs Elysees, Paris,
June 10, 1867.

SIR,—In reply to your letter of the 30th ultimo, in which you are good enough to ask, by order of Her Majesty's Schools Inquiry Commissioners, my opinion on a letter addressed to them by Dr. Lyon Playfair, I have the honour to state that in the substance of that letter I concur. Speaking only with reference to machinery, the department with which I am immediately connected, there can be no doubt as to the immense strides which foreign mechanical engineering has lately made, notably, I think, in the case of France and Belgium, and by which they are rapidly overtaking the industrial power of Great Britain.

My impression is that this advance has been greatly owing to a successful copying of English designs, and to the use of English machine tools. Of course, did the foreigners merely confine themselves to copying, they would never surpass us, but while following that which in our mechanical designs is good, they are also seeking (and that not unsuccessfully) to apply theoretical knowledge in a way which, to my humble judgment, shows that they will soon have little to learn from us.

I would allude notably to the economical use of steam, though no doubt their inventive faculties have there been quickened by the high price of fuel on the Continent. I cannot, from my own knowledge, speak of the means of instruction available to the working public abroad, but I have always understood it to be superior to our own; and assuming it to be so, I cannot conceive any reason which would better than that account for a difference of industrial progress.

I trust I may not be deemed presumptuous in stating what I believe to be a very great want in England, viz., such an institution as the well-known "Arts et Metiers" of Paris. I know of no national institution where the public of our own country may study practical mechanics and the arts appertaining thereto. Such a one would, in my opinion, be valuable, not only to working men and their superiors, but to engineers. It should be an evidence of the most advanced mechanical knowledge of the country; and while teaching primarily through the eye by the models and machines exhibited, it would naturally form the focus of other means of instruction by lectures, classes, &c.

I apprehend it is only when taken up by Government that such an institution would assume proportions sufficient to be really effective as a means of national education.

I have, &c.,

FRED. BEAUMONT,

Capt. R. Engineers.

H. J. Roby, Esq., &c., &c.

9. From Warington W. Smyth, Esq., M.A., F.R.S., Lecturer on Mining and Mineralogy in the Royal School of Mines.

28, Jermyn-street, S.W.,
June 14, 1867.

SIR,—I have the honour to acknowledge the receipt of your letter of the 31st ultimo, inquiring, for Her Majesty's Schools Inquiry Commissioners, whether I agree with the substance of Dr. Playfair's letter of the 15th ultimo, addressed to Lord Taunton.

Having gone carefully, as juror, through the objects exhibited in Class 47 at the Paris Exhibition, and having also examined with much interest many of the productions in Class 40, as well as other portions of the Exhibition, I am bound to admit that our British portion of the display was generally meagre and defective, partly from tolerably obvious causes. I was not so much struck by this lack of fair representation of many of our branches of industry, as I was by the decidedly greater progress which has been made of late years by several of the Continental nations, and that too in several departments which used formerly to be considered almost exclusively our own.

As regards the broad question of technical education, I will only add, that the greater proportional advance-

ment made by France, Prussia, and Belgium in zinc, colliery working, and metallurgy, appears to me to be due, not to the workmen, but in great part to superior training and attention to the general habits of their subject, observable among the managers and sub-officers of the works. No candid person can doubt that they are far better educated, as a rule, than those who hold similar positions in Britain. I have, &c.

WARINGTON W. SMYTH.

H. J. Roby, Esq., &c., &c.

(To be continued.)

PARIS EXHIBITION.

The collection of arms has just been increased by an enormous cannon, produced at the Imperial foundry of Ruelle, within the last few months; it consists of an iron body, strengthened by two steel coils. The weight of this piece, which is intended for port service, is to be 37 tons; the diameter of the chamber is rather than 17 inches; it is a smooth-bore breech-loader. The projectiles are, a solid spherical shot, of 600lbs. weight, and a shell of the same form, weighing 420lbs., and containing 18lbs. of powder; and the charges for the two respectively 100lbs. and 66lbs. It is mounted on a cast iron carriage; and a small crane, like that employed in England, fixed on one side of the carriage, serves to place the projectile in the mouth of the gun. The enormous piece of ordnance is of a long, bottle-like shape, longer in proportion to its diameter than either the Prussian or English monster gun. The weight of the carriage and its appurtenances is given as 24 tons, making a total weight of 66 tons. The gun stands on the bridge which crosses the quai and facing the river, and around it are arranged specimens of the various pieces used in the French navy, namely, rifled cast-iron guns of 27, 24, 19, and 16 centimetres calibre, and brass 12 and 4-pounders for gun-boats. It is a formidable exhibition.

The Emperor and Empress have recently paid a visit to the great Omnibus restaurant in the grounds of the Exhibition, and the Duc de Persigny and some other gentlemen dined there the other day *incognito*, partakers of the ordinary fare, in order to test the quality. Report has also been made, by order of the Imperial Commission, and a few extracts from this document will be found interesting, and may be of service to English workmen visiting the Exhibition.

Since the 8th of April, when the restaurant was opened, the number of customers amounted to 365,000 persons who have spent in all 494,500 francs, giving an average of 3,600 meals per day, at the rate of 1s. 2d. each. The report only comes down to the middle of July, at which time, it is said, the number of daily visitors had reached an average of 5,713. The extent of the establishment is indicated by the preceding figures, but it may be added that the number of persons employed there amounts to 220. Numbers of the delegates from the French provinces and foreign countries, bodies of working men from various factories, orpheonists, and military musicians, have made use of the restaurant, and the dinners served to them have varied from 1s. 2d. to the highest price. Most of the visitors to the Exhibition have tested the Omnibus restaurant, and the reports are generally very favourable, especially as regards the abundance to be had for the money expended, and the civility of the attendants, who are almost all women. It should be added that visitors are not fixed by any rate, but may merely take a basin of soup if they please. The prices of the dishes have already been given in the *Journal*.

Amongst the means which have been brought in aid of the visits of the working classes, the encouragement established by a commission formed for the special purpose of encouraging such visits, deserves to be specially mentioned. It is close to the Exhibition, in the Avenue Rapp, and consists of a series of wooden huts, arranged

much in the same way as in a camp, and comfortably fitted up. The military musicians from various countries who visited Paris recently, were accommodated, to the number of 650, in the encampment for fifteen days, without any inconvenience; these musicians included Austrians, Prussians, Russians, Spaniards, Dutch, Bavarians, and Belgians. About 500 men from Perche, in the Orme, are now installed in the camp.

The grand banquet of the exhibitors, at which, it is said, the Emperor will be present, is at last definitely fixed for the 16th inst. It is expected that there will be twenty thousand persons present. It is to be held in the Hippodrome.

Fine Arts.

SCHOOLS OF ART.—It is reported that 99 schools of art are now in operation, five of which are new during the last year. Upwards of seventeen thousand students are receiving instruction in art in these central schools, and the total numbers taught drawing in all central schools, schools for the poor, and night classes, are over one hundred and five thousand. The fees received exceed eighteen thousand pounds. These figures, after due allowance made under recent minutes, indicate some slight increase on previous years. It is also reported that the art scholarships, lately instituted for the purpose of making the art schools of the country and the art collections at South Kensington bear more directly on manufactures and industries, have attained the end contemplated. It appears that two national art scholars are engaged in carrying out the decorations of the Kensington Museum, and two more are also now modelling decorations in terra-cotta for the Wedgwood memorial in the Potteries. Students in the etching class are under the instruction of Mr. Lane, A.R.A. Thirty-nine art schools throughout the country, that is, more than one-third of the total number, have borrowed works from the Kensington Museum as aids to study. Under recent minutes thirty-two "night art classes" have been established, for pupils above 12 years of age, in parochial schools and working men's institutions, which number is after the rate of nearly one night class for three towns possessing central schools throughout the country. Schools for the poor have now control over the art instruction of their pupils, and assist in the conduct of annual examinations. It appears that 560 of such schools have already availed themselves of recent provisions made in furtherance of national art education, and that 80,084 children in these schools have been taught drawing during the past year. The number of prizes awarded to art schools and classes generally has considerably diminished; the Department, it was understood, considered that prizes had of late been in excess.

THE PARIS EXHIBITION.—The select committee appointed to consider and report on the advisability of making purchases from the Paris Exhibition for the benefit of the Schools of Science and Art in the United Kingdom, and any other means of making that Exhibition useful to the manufacturing industry of Great Britain and Ireland, have considered the matters to them referred, and agreed to the following report:—"1. They are of opinion that it is desirable that purchases should be made at the Paris Exhibition of objects of art and science, especially of such as illustrate modern scientific inventions and discoveries, and the application of art to manufactures, and that the exhibition of such objects in the Museum of South Kensington, and, by circulation, in local museums in different parts of the United Kingdom, would be useful to the manufacturing industry of the country, and for the artistic and scientific instruction of the schools in connexion with the Science and Art Department. 2. That as one of the principal objects of such purchases should be to show the progress made by other nations in manufactures, and in the appli-

cation of art and science to practical purposes, examples of foreign origin should, in the first place, be secured in preference to those of British production. 3. That it is not desirable that pictures and modern statuary sculpture should be purchased. 4. That, considering the importance of such purchases to the development of the manufactures and trade of the United Kingdom, they recommend that a liberal grant be asked from Parliament for the purpose of making them. They have not sufficient data before them to enable them to suggest the sum which might be advantageously expended, but they consider that under no circumstances should it exceed £25,000. 5. Lastly, they are of opinion that no objects should be purchased at the Paris Exhibition except such as shall be recommended by a commission consisting of gentlemen distinguished for artistic and scientific attainments, who should consult with the two art referees attached to the Department of Science and Art, and other competent persons. They further think it desirable that the referees should furnish written reports upon the objects recommended by them for purchase."

Manufactures.

FRENCH WAGES AND WORKMEN.—A report rendered to the Foreign-office this year by Mr. Julian Fane, secretary of embassy at Paris, speaks of wages of skilled artisans in various towns in France as ranging from 5*fr.* to 10*fr.* a day; for inferior workmen, from 2*fr.* to 3*fr.*; for workwomen in a clothing establishment, from 2*fr.* to 4*fr.* or 5*fr.*; for children, from 1*fr.* to 2*fr.* The general rate of money wages in France may be said to have increased about 40 per cent. in the last 15 years, but the rise in money wages has been accompanied by a very considerable rise in the price of the ordinary articles of consumption and in rent of lodgings, so that the improvement in the position of the labourer, meaning his power to supply himself with the necessaries and comforts of life, has been far from commensurate with the rise in the money value of his labour. Still, the relative proportions in which money wages and the price of commodities have risen leave a margin in favour of the former, and to this extent there has been a rise in real wages, enabling the labourer to feed, lodge, and clothe himself somewhat better than he could 15 years ago. This has been the natural consequence of the rapid development of industrial enterprise and the increased demand for labour; and it may also have been affected by the greater facilities afforded to the labourer by the influence of opinion, and recently by legislation, to claim a larger share in the profits of production. It is difficult to estimate the relative price of labour in England and France. The rate of money wages may be higher in one country than in the other, but no just comparison can be instituted unless the quantity and quality of labour supplied in each case are fairly appraised. It is a question which only experts can decide, and they differ upon it. Combinations to influence the rate of wages were formerly punished in France as misdemeanours, but three years ago a law was passed, under which they are not illegal unless accompanied by violence (including insults), or menace, or fraudulent manoeuvres, including false representations. Ample advantage has been taken by the workmen of this change in the law. There is scarcely a trade in France whose members have not combined in the last three years for the purpose of increasing the rate of wages and diminishing the duration of labour, and their efforts to this end have usually met with success. The employers, for the most part, assert that the law has proved to them an unmitigated evil, submitting them to the tyrannous coercion of the employed. Various forms of the co-operative system are in course of trial in France, with a view to prevent or lessen this collision of interests. The association of masons, for instance, is one that has met with remarkable success;

some of the workmen are shareholders, and others are engaged as ordinary labourers, and have no share in the profits, while some members of the association are simply holders of capital. In other establishments the workmen are allowed to share in the profits of the business by means of rewards or prizes allotted to them, or to the more worthy among them, by the proprietors at the end of the year, or by facilities for procuring food, clothing, lodging, and education for their children on advantageous terms. Mr. Fane gives it as his judgment that the fault in the organization of the co-operative societies has been generally too much faith in the combination of skill and labour, and too little regard for the advantage of capital; and that the workman should aim at becoming, in some measure, a capitalist himself, by the aid of societies of consumption enabling him to effect savings in expenditure, before he seeks to become a co-operator with the capitalist in industrial enterprise.

Commerce.

THE CENTRAL PACIFIC RAILWAY.—The chief difficulties apprehended in the construction of the great railroad to the Pacific, high mountain crossings and winter snow obstructions, seem to have been, to a large extent, overcome. The two mountain ranges had to be crossed at elevations of over 7,000 feet, or nearly three times the height of any railway lines hitherto built in America. Experience shows that it is entirely practicable, and that the deep snows are not likely to prove very serious obstacles. The Central Pacific Railroad of California, the western end of the great national route, commencing at Sacramento in 1868, encountered, at the outset of its career, the mountain difficulty in its worst form; the dreaded Sierras had to be overcome within the first hundred miles. In November last, however, it had carried its track nearly to the summit, and had demonstrated the feasibility of the whole mountain passage with less average engineering resistance than that with which the Alleghanies are crossed. During an unusually severe winter it has been successfully worked as far as built. It has had large working parties on the Summit Pass, so as to convince its officers that the fear of impassable snow-drifts is groundless. Only three days have the trains failed to make the regular trip. From Sacramento to Cisco station, the present terminus, is 94 miles, in which 5,911 of the total 7,042 feet of ascent is made. This portion embraces the heaviest and costliest portion of the work. The ascent is continuous; once gained, it is never lost, the average rate being 75 feet to the mile; the maximum, 116 feet to the mile, of which there are but 3½ miles. The bulk of the heavy gradient is at 105 feet to the mile, with numerous level intervals interspersed. Thirty per cent. only of the distance is occupied by curves, none of which have a radius of less than 573 feet. The Baltimore and Ohio Railroad has 17 miles, in two stretches of 116 feet grade, with curves of 400 feet radius; and the Virginia Central for many years worked with the unaided locomotive grades of 296 feet to the mile, and ruling curves whose radii were 300 feet. By crossing from one spur and ridge to another, piercing by a number of short tunnels and deep cuts where necessary, the line has been made available for passenger trains to run at 25 miles an hour, and goods trains at half that speed. The time consumed in making the trip, including stoppages, is six hours, with ordinary engines and trains. From Cisco to the Summit most of the heavy rock cutting is now done. The crest of the ridge is pierced by a tunnel of 1,658 feet, the longest on the road, of which about 500 feet remain uncut, and at which men are working night and day the week round, excavating at the rate of seven feet per day. East of the summit the descent is much easier, the great interior basin being elevated 4,000 feet above the sea level. In 14 miles there is a fall of 1,100

feet, after which there is a gentle slope, nowhere exceeding 45 feet to the mile, eastward toward Salt Lake. The greater portion of the line is so sheltered by excavations that it will be necessary to erect sheds over it for 4 miles only, in order to shoot the snow-slides clear of the track. Provision is made in the larger tunnels and cuttings for a double line, which, from present indications will be necessary at no distant day, to accommodate growing traffic. The original estimated cost of building the road across the Sierras was slightly above that of the most expensive railroads in the country where the cost of way had to be purchased at considerable cost; compared as follows:—

Boston and Providence Railroad cost	\$1,250,000
Boston and Lowell Railroad cost	750,000
New York and Erie Railway about	800,000
Hudson River Railroad about	500,000
Central Pacific (Mountain Division) estimated	550,000

Up to the 1st January last the Central Pacific Company had expended in building the 94 miles in operation, together with about a third of the preparation for 100 miles additional, and for a liberal equipment of stock, nearly 15,000,000 dollars. The total cost of the mountain section will be about 100,000 dollars per mile. The rest of the distance to Salt Lake City, 575 miles, be constructed for about 60,000 dollars per mile.

Colonies.

THE STATE OF QUEENSLAND.—With such a population in proportion to the extent and value of its territory, Queensland is dependent on immigration for its prosperity and the development of its resources. The wealth of the colony in land and minerals is only a process of discovery. Every year increases the knowledge of what can be profitably extracted from the soil or from beneath the surface. This wealth cannot be rendered available without a constant inflow of population for years to come; nor can it be done by an increase of numbers, without reference to their utility for colonists, or to the other surrounding circumstances. It has been experienced that the sudden arrival in large numbers, of people without any means of support, entirely dependent on the receipt of wages from the day of their landing, so disarranges the relative positions of employers and employed as to cause much misery and even to give the appearance, for a time, of a very abundance of population in some districts. This cannot be cured by a total stoppage of immigration of every sort, though it necessitates a cessation of the particular description which has been carried on in excess for some time past, and a large portion of which has been a source of loss to the colony. The present position of this country is by no means an exception to the rule. Every young community, unless it absolutely stands still, like Western Australia, or retrogrades, like Tasmania, is sure to have a recurrence of periods of undue inflation, followed by seasons of more or less prostration. Old residents of each of the Australian colonies will all testify to the fact that every colony has, in its turn, passed through far harder times than have been seen here. They have invariably been quickly recovered, through having their energies directed to the necessity of increased production, and the prosperity which has followed has been in proportion to the increase of numbers attracted by those resources the availability of which has been proved in the experience of the pressure of the times.

THE ALPACA IN NEW SOUTH WALES.—A Sydney paper says:—"It is unfortunate that the attempts to naturalise the alpaca near Sydney have not been successful. For some time those in Parramatta and the did very well, but several have died lately, and the

is reduced to three. It is intended to remove higher land, under care of some member of the colony, who may be willing to take charge of them." **VICTORIA, &c., IN VICTORIA.**—This colony expends £100 per annum in furnishing the people with books of instruction, and three-fourths of the population are able to read, and nearly two-thirds can read and write. It maintains a free public library containing over 40,000 volumes, besides a gallery of art and a museum of the natural sciences; and various institutions for the relief of almost every form of human suffering; there are about 100 places of public worship; upwards of 800 branches of benevolent societies, with a revenue exceeding £100 per annum; nearly 18,000 savings' bank deposits, with more than \$700,000 standing to their credit, £15,000 lodged in the Post-office savings' bank; upwards of 900 manufactories, with a capital of nearly two millions sterling, giving employment to 100,000 people; the export and import trade represents a regate of over £26,000,000, being more than £42 million. There are upwards of 276 miles of railway in operation, and more than three thousand miles of telegraph-wires.

AGRICULTURE IN VICTORIA.—The harvest returns of 1866 show that about 6,000,000 bushels of wheat, and barley, and 83,166 tons of potatoes were raised; and the calculations of the Registrar-General show that there are about one hundred head of 14,000 sheep, 20 horses, and about 12 pigs to 100 men, women, and children in the colony. At the skilled labour receives from 8s. to 10s. for hours' labour; the farm labourer 8s. to 12s., with lodging; day labourers, 6s. to 7s. per day; female domestics, £25 to £30 per annum; while the male is 6d. per loaf, and meat 6d. per pound. There has been a steady decline in wages during the last 18 years, which is mainly to be traced to the cessation of immigration.

EMIGRATION IN 1866.—The following is a statement of the number of persons who emigrated from England to the Australian and New Zealand colonies last year, showing a decrease of not less than 13,186 persons, as compared with the number in 1865:—

New South Wales	1,648
Queensland	6,054
Victoria	8,631
South Australia	3,392
West Australia	167
Tasmania	7
New Zealand	4,298
Total	24,097

Notes.

INTERNATIONAL CO-OPERATIVE CONGRESS.—An international congress is announced to take place in Paris, on the 16th, 17th, and 18th of the present month of August, under the presidency of a well-known writer on political economy, M. J. E. Horn. The questions to be discussed are: 1st. The division of profits amongst members of co-operative societies, and the application of funds to various purposes; 2nd. The correspondence of co-operative associations in France, and between those and foreign associations; 3rd. The utility of these associations in agricultural districts, and the means of furthering the movement in that direction; 4th. The application of co-operation to public instruction by means of libraries, adult classes, and instruction of various kinds; 5th. The liability of members of co-operative societies beyond their subscriptions. Foreign associations are invited to send delegates to represent them at the congress. The fee is fixed at ten francs, which confers a right to a copy of all publications of the congress. The council an-

nounces that strangers may address the meetings of the congress in their own language, arrangements having been made for giving immediately a *résumé* of such speeches in French. The meetings are to be public, admission to be obtained by payment of half a franc. Subscriptions received at the offices of the Société du Crédit au Travail, 3, Rue Baillet, Paris.

FIRE-PROOF DRESS.—M. Champy, a lieutenant in the French navy, has just exhibited at Billancourt an ingenious arrangement, of his invention, to enable persons to approach the centre of a conflagration, in order to suppress it, or to save other persons from the flames. The principle of his invention may be stated in a few words,—the wearing of a dress continually saturated with water. He places over his head a conical woollen hood, with eye-pieces, dresses himself in woollen garments and gloves, and fastens a strong belt round his waist, from which depend the branch in connection with a fire-engine, and a tube with a stop-cock, by means of which he can saturate the conical cap and all the rest of his equipment. Some faggots saturated with benzine were set on fire, and in a few seconds M. Champy put on his dress, saturated it with water, and, approaching close to the burning mass, extinguished the fire without difficulty.

GENERAL CEMETERY FOR ALL PARIS.—An inquiry has been opened by the authorities of Paris on a subject which has been for some time under consideration, namely, the formation of a general cemetery for the whole metropolis, at a spot near Pontoise, in the department of the Seine and Oise, distant about twenty miles from Paris, and of a special railway in connexion with it. Outlines of the project are now open to the public at the Prefecture of Paris and the sub-prefecture of St. Denis; and all persons interested in any way in the subject are invited to make their observations, in books kept for the special purpose, between this and the 16th of August.

GREAT MUSICAL PRIZE IN FRANCE.—The Institute of France has, at the instance of the Academy of the Beaux Arts, conferred the biennial prize of 20,000 francs on M. Félicien David, author of the "Desert," "Herculeum," "Lalla Rookh," and many other works.

MUSEUM OF THE CITY OF PARIS.—The municipal museum now being formed at the Hôtel Carnavalet in Paris will, it is said, be shortly opened to the public. It will comprise eight sections or divisions:—1. Charters and original manuscripts relative to the history of Paris. 2. Seals, medals, and tokens. 3. Sculpture, and objects of archaeology. 4. Prints and miniatures. 5. Pictures representing various important events which have occurred in Paris, the monuments and the aspect of the city, or persons famous in its history. 6. Books published in Paris. 7. Specimens of the productions of the principal trades. 8. Furniture, and historic costumes.

SCIENTIFIC BALLOON ASCENTS IN FRANCE.—M. Flammarion made his eighth ascent the other day, with a companion, in a balloon of moderate size, called the "Imperial." In order to make certain observations it was necessary that the aeronauts should pass at least once through the rain and through the clouds which yielded it, and this object was accomplished; they passed the whole night in the region of the meteors, one occupied with the direction of the balloon, the other with his observations. Leaving Paris early in the evening, they passed the frontier into Belgium about midnight, near Rocroi, having passed to the right of the towns of Daunmartin, Soissons, and Laon. Afterwards passing to the left of Namur, Liege, and Aix-la-Chapelle, the balloon entered Prussia at the break of day. Before midnight it rained, and the balloon had great difficulty in piercing the clouds; but after that time the sky became clear, and the moon shone brightly. Before daybreak M. Flammarion was principally occupied with observations respecting the formation of the clouds, and during this time they were between 5,000 and 8,000 feet above the surface of the earth. At the latter elevation at daybreak, the thermometer

stood at 2° centigrade. The observations generally referred to the condensation of the watery clouds and the temperature of the air in the upper regions. At five in the morning the aéronauts found themselves over the Rhine, and their ballast being exhausted, they thought it prudent to descend, which they did near Solingen, in the department of Düsseldorf, about ten leagues from Cologne, and four hundred miles from Paris. M. Flammarion intended to make a second ascent, and with this view three small balloons were attached to the larger one, whereby the last was kept inflated during the whole day, but the second ascent was not attempted, probably on account of the unfitness of the weather. Previous to the ascent above referred to, another was made in the great balloon the "Giant," but the rents in the silk, and the weight of the car and its contents, marred the intended voyage.

PARLIAMENTARY REPORTS.

SESSIONAL PRINTED PAPERS.

Delivered on 24th July, 1887.

- Par. Num.**
 263. Bill—Weights and Measures (Dublin).
 269. " District Lunatic Asylums Officers (Ireland) (amended).
 271. " Poor Law Board, &c. (amended).
 272. " Offices and Oaths (Lords Amendment).
 399. East London Water Bill, &c.—Report from the Select Committee.
 429. Factory Acts Extension and Hours of Labour Regulation Bill—Report from the Select Committee.

Journal of the Society of Arts.

FRIDAY, AUGUST 16, 1867.

Announcements by the Council.

ARTIZANS' VISIT TO PARIS.

Her Majesty's Government have granted to the Society of Arts, in aid of the fund now being raised by the Society for assisting workmen, specially selected from various trades, to visit and report on the Paris Exhibition, the sum of £500, conditional on the Society raising a like amount by public subscription.

The following is the list of subscriptions up to the present date:—

H.R.H. THE PRINCE OF WALES, President ..	£31	10	0
HER MAJESTY'S GOVERNMENT (conditional) ..	500	0	0
Society of Arts ..	105	0	0
Earl Granville, K.G. ..	5	0	0
Lord de L'Isle ..	10	0	0
Thomas Twining ..	2	2	0
Sir J. P. Boileau, Bart. ..	5	0	0
George Godwin, F.R.S. ..	1	1	0
Vice-Chancellor Sir W. Page Wood, F.R.S. ..	10	0	0
W. H. Bodkin (Assistant-Judge) ..	3	3	0
Sir Rowland Hill, K.C.B. ..	3	3	0
Benjamin Shaw ..	2	2	0
Alfred Davis ..	10	10	0
Eugène Rimmel ..	5	5	0
Frederick Mocatta ..	2	2	0
James Marshall ..	2	2	0
Robert Dawbarn ..	1	0	0

Messrs. J. M. Johnson and Sons have kindly placed at the disposal of the Council a number of their five-shilling English Catalogues of the Exhibition, sufficient to present each workman with a copy.

Subscriptions may be forwarded to the Financial Officer, at the Society's House.

The Council are now prepared to receive the names of any workmen recommended by their respective trades as fit and proper persons to undertake this important duty on behalf of their fellow workmen. A certain number have already been selected, and some of them are now in Paris.

Proceedings of the Society.

SOCIETY'S VISIT TO PARIS.

The Society's visit to Paris terminates this day. Nearly two hundred cards of membership were issued, and a considerable number of the members availed themselves of the facilities afforded them for visiting the various manufacturing establishments and other objects of interest in the French capital.

FOOD COMMITTEE.

The following observations are quoted from the special correspondent of the *Chemical News*, in reference to the display of Chemical and Pharmaceutical Products shown in the Class 44, Paris Exhibition:—

Numbered 7 in the English catalogue (8 in the *Catalogue Général*), we find "Borwick, George, 34, Chiswell-street, London. Baking powder, chemicals, spices, &c.," and we are also referred to p. 132 of the appendix for further details. What can induce anyone to exhibit baking powder we are really at a loss to imagine. It is only a subject of any scientific interest; it is a novelty; it is not interesting in appearance; its physical character offers no guarantee of its purity, in fact, its negative qualities preponderate so largely, positively we are astonished that its exhibitor did (like a great firm of blacking manufacturers) obtain a medal. And yet this baking powder, so insignificant in appearance, so uninteresting in a scientific point of view, so unfit, therefore, for exhibition, is, measured by a commercial standard, of far more importance than many objects that rivet our attention by their beauty or scientific interest. We have been credibly informed that a fortune has been made by its sale.

Then what is this baking powder out of which fortunes have been or are to be made? Of the composition of the powder of Borwick we know nothing, but Cooley's powder is as follows:—Tartaric acid, $\frac{1}{2}$ lb.; bicarbonate of soda and potato farina, or British arrow-root, of each $\frac{1}{2}$ lb. (each in powder); separately dry them perfectly by a very gentle heat, then mix them in a dry

room, press the mixture through a sieve, and at once put into packets, observing to press it hard, and to cover with the foil or close-made paper, to preserve it as much as possible from the air and moisture. Delfort's formula principally differs in the addition of *alum* (?) and carbonate of ammonium. With the addition of a little turmeric the compound becomes the "Egg-powder" so often seen in the windows of grocers and oil-men. These mixtures are used in domestic economy as substitutes for yeast in bread and butter in pastry, and are in their way, and in their proper places, useful, although humble adjuncts to the *materia* (may we not say *medica*) of the non-professional cook. There is no doubt that by enabling pastry to be made equally light, and with one-third less baking, the better class of baking powders have prevented many a bilious and dyspeptic attack.

Mr. Borwick, in addition to his baking powder, exhibits what he terms "ozoneized cod-liver oil." We are sorry to find cod-liver oil "repeating" itself in the notices of the chemical and pharmaceutical products at the French Exhibition, but we will not allow the unsavoury nature of the subject to turn us from our duty. We consider "ozoneized cod-liver oil" to be the greatest of the many delusions connected with this useful food for food it is purely and simply, and the sooner medical men understand its true character the better for the patients.

Mr. Borwick's prospectus states that the impregnation of cod-liver oil with ozone is for the purpose of "conveying artificially to the lungs of the delicate and consumptive, without the effort of inhalation, and in large proportions than found in the atmosphere, this extraordinary life-giving agent." The prospectus concludes with the following somewhat rash paragraph:—"In fact, it is now proved beyond doubt, that ozone is to the weak, delicate, and consumptive, what quinine is to those who are affected with fever—the nearest approach to a specific yet discovered." The italics are those of Mr. Borwick.

Now, it appears to us that this prospectus is on certain points of resemblance to the three incompatible pleas against the cracked pot, viz:—"1st. That it was cracked when we borrowed it. 2nd. That it was whole when we returned it. 3rd. That we never had it at all." For, in the first place, a distinguished chemist who purchased some and examined it, came to the conclusions—1st, that it did not convey ozone to the lungs of the delicate and consumptive; 2nd, that if it did, it was not to the weak, delicate, and consumptive, what quinine is to those who are affected with fever; and, 3rdly, that it did not contain ozone at all. It is really inconceivable how any one with even a smattering of chemical knowledge could imagine, even if the oil did contain ozone, that it would carry it to the lungs. The trifling fact that the oil has to be digested before it can enter the blood seems to escape the believers in this so-called remedy. That certain oils acquire powerfully oxidizing properties on exposure to light and air we admit, but it must be remembered that in all cases yet known the active oxygen attacks the oil itself as fast as the temperature is raised, and may even attack other oxidizable substances present at the same time. The most remarkable instance of the oxidation of essential oil, is, undoubtedly, that of isoprene; but when ozone isoprene is distilled (although it boils at about 40°C.) the ozone present attacks the isoprene with violence, and converts it into an oxidized substance. We think, moreover, with the observer of that reaction, that it is doubtful if the oxygen in what we have hitherto termed ozoneized oils is really in the state of ozone. The phenomena attending the passage of ozone through tubes of caoutchouc seem to indicate the impossibility of ozone existing (as such) in the presence of oxidizable organic matters.

Even if we admit that consumptive patients are better in an atmosphere which indicates the presence of ozone (or what is assumed to be ozone), what does that really

rove? It seems to us rather to show that consumptive people are better when the air is free from the impurities incompatible with the presence of ozone, than that the zone is beneficial to them. The reaction indicated by zone test papers is not the measure of the total quantity originally in the air, but of the residue left after the destruction of the impurities. But enough of this; we trust that the time is fast approaching when medical men will know more, and talk less, about oxygen and ozone. If one did not hear it so often, it would seem impossible, that in these days of education, doctors are still found who tell their patients to go to the sea-side, 'where there is more oxygen than in the close and confined streets of towns.'

Proceedings of Institutions.

LANCASTER MECHANICS' INSTITUTE.—The forty-first annual report says that although the number of subscribers is slightly less than last year, there seems to be a lively interest in the business of the Institute manifested by those who are identified with it. The number of members on the books is 468, against 493 of last year. The whole interior of the building has been thoroughly cleaned and repaired. There are now 5,643 volumes in the library; the number of volumes issued during the year is 4,265. The classes, which are for French, chemistry, geology, and English, have, with the exception of that for geology, been continued to the end of the session, and although the number of those who attended was but small, yet the importance of instituting such classes will be seen in the success which has attended their continuance during the present year. In addition to these classes, a class for the study of pure mathematics was conducted by the Rev. J. C. Lunn. The number of pupils was 26, the average attendance being 18½. The class continued for thirteen weeks, and, for the time, the pupils made satisfactory progress. The classes which have been commenced this session are a complete success. They are:—Females' writing and arithmetic class (26); females' writing and reading class (26); boys' writing and arithmetic class (28); chemistry class (33); mathematics (22); ladies' French class (9); gentlemen's French class (10); singing class (14); young men's writing and arithmetic class (7); and English language class (55). The museum has been provided with additional accommodation for the fossils and minerals, and considerable time has been spent by Mr. W. Prosser, F.G.S., who at the request of the committee undertook the task of carefully arranging the whole of the collection, so that the new classification should be in accordance with the present aspect of science. The librarian, Mr. Joseph Bell, who for a period of sixteen years has studiously watched the progress of the Institute, having resigned, the committee having, in reply to public advertisement, received 120 written applications, appointed Mr. J. W. Shaw, of Halifax, to the office. The report of the penny bank shows that the receipts for the year ending 27th October, 1866, were £633 0s. 7d., and the total receipts since April, 1860, were £7,280 0s. 1d., the average number of weekly depositors being 239. The accounts show that the expenditure was £297 19s. 10½d., and that there is a balance due to the treasurer of £129 19s. 10d. The committee of the Lancaster School of Art, in making their tenth annual report, record the continued success of the school. The number of students who have paid fees for instruction during the year is 841, of whom 85 were artisans. At the annual examination of the Department twenty of the students were successful. The most advanced works executed in the school were also sent to London in competition for prizes, and seven were successful; one work, by W. J. Ralph, has been rewarded by a bronze medallion in the national competition.

EXAMINATION PAPERS, 1867.

The following are the Examination papers set in the various subjects at the Final Examination held in April last:—

(Continued from page 601.)

BOTANY.

THREE HOURS ALLOWED.

The candidate is expected to answer correctly three questions in Section I. and six questions in Sections II. and III., including descriptions of at least two of the fresh specimens. Nos. 8, 9, and 10 each stand for an answer.

SECTION I.—STRUCTURE AND PHYSIOLOGY.

1. Define the following terms, and comment upon each, as required:—

Didymous. Give examples from two Natural Orders.

Gonidia. Where do they occur? What is their function?

Gynandrous. Give examples.

Gynophore. Give example.

2. What are *vessels*? From what Organs and Families of plants are they usually absent?

3. Explain the structure and function of *stamens*.

4. What distinctive features characterise the principal types of *stem-structure*?

5. Describe briefly the process of *reproduction* in flowering plants.

6. Explain the usual conditions to be observed in *hybridising* plants, and the results of this process, both physiological and practical.

SECTION II.—SYSTEMATIC AND ECONOMIC BOTANY.

1. What is meant by *genus*, *species*, *variety*?

2. What genera (giving their Natural Orders) furnish oil and sugar for economic purposes? Name the part of the plant in each case.

3. Distinguish *Labiata* from (1) *Scrophulariaceae*, (2) *Boraginaceae*, (3) *Verbenaceae*.

4. Describe the principal modifications of the *Fruit* in British genera of *Rosaceae*.

5. Name the Natural Orders and genera to which the British trees with *winged fruits* belong.

6. Upon what ground is importance attributed to the *stamens* for purposes of classification? What characters, afforded by those organs, are made use of in distributing *Dicotyledons* into primary groups?

7. Name the *Natural Order* to which the plants marked A, B, and C respectively belong, with *reasons* for your opinion.

SECTION III.—DESCRIPTIVE BOTANY.

8, 9, and 10. Describe the three plants marked A, B, and C, in the proper sequence of their organs, and in accordance with the examples given in Lindley's "Descriptive Botany" and Oliver's "Lessons" (Appendix).

FLORICULTURE.

THREE HOURS ALLOWED.

1. Is it possible to increase the hardness of any race of plants, and what are the most likely means by which this may be effected?

2. Name the most useful flowers for the decoration of the conservatory, to be had in bloom during September, October, and November; and indicate how each is to be prepared for blooming at that season.

3. Explain the general features of dissimilarity in the cultivation of Ferns and Succulents, and of Heaths and Orchids.

4. Tabulate the ingredients, in their respective proportions, which should be used in making up a compost for potting the following plants:—*Calceolarias*, *Fuchsias*, *Camellias*, *Stocks*, *Asters*, *Bletias*, *Cattleyas*, *Allamandas*, *Roses*, *Dahlias*, *Crysanthemums*, and *Rhododendrons*.

5. Write down the rules by which you would be guided in proceeding to water the plants in a greenhouse in the month of January, indicating how, when, and why the operation is to be performed. State all the considera-

tions, as far as known to you, which should influence the operator.

6. By what means may the races of cultivated plants be improved, so as to render them more valuable either for use or ornament?

7. Why, when, and how would you ventilate a forcing-house in full action, in the month of March, presuming that it is to be ventilated daily?

8. How would you turn to advantage, in practical floriculture, the limit of temperature, both above and below the mean, endurable without injury by different plants?

9. Show in section (by a pen-and-ink sketch) what you consider the best form of house for the purpose of Propagating plants, also that for growing Roses and Camellias respectively, indicating as far as possible by this means the internal arrangements, and noting the dimensions.

10. Name and briefly describe a dozen of the most distinct and useful plants for what is called "sub-tropical" gardening.

11. Mention as many as you can of the plants which may be propagated by leaf-cuttings, and state from what part respectively they will organise buds.

12. Give a monthly table of the temperature proper for the successful cultivation of each of the following classes of subjects:—Stove plants, Greenhouse plants, and Alpines.

FRUIT AND VEGETABLE CULTURE.

THREE HOURS ALLOWED.

FRUIT CULTURE.

1. Name eight dessert apples which ripen in succession, and state the seasons when they come into use?

2. Name eight dessert pears which ripen in succession, and state the seasons when they come into use?

3. How would you distinguish a Noblesse peach tree when in bloom from a Barrington; and how would you distinguish both from a Royal George?

4. How would you distinguish the Dutch Hamburg grape from the Frankenthal?

5. What are the causes that produce rust in grapes, and how are these to be remedied?

6. Give a list of six Peaches and four Nectarines that will ripen in succession, filling up the space between the 1st of August and the middle of October?

7. Give a list of six Plums and six Cherries that will ripen in succession from the second week in June till October?

8. What is the best season to plant fruit trees; and why is it so?

9. In what way does root-pruning induce fertility in fruit trees?

10. When trees are bark-bound, and produce a weak and languishing growth, and small ill-shapen fruit, what remedy would you adopt?

11. If one of the principal branches on a trained tree are producing shoots of too great luxuriance, while the other branches produced those of ordinary growth, how would you check the over luxuriance so as to preserve an equilibrium of the tree?

12. At what season and in what way should root pruning be performed?

VEGETABLE CULTURE.

13. Mention the varieties most worth cultivating in small gardens of the following kinds of vegetables:—Peas, Broccoli, Cabbage, Carrot, Kidney Beans, and Lettuce?

14. What variety of Lettuce would you employ to stand the winter?

15. Give a list of the Wrinkled Marrow Peas with which you would keep up a supply from the first week in June till the end of October, and state the periods when they are to be sown and when they will come into use?

16. How would you distinguish white globe onion from white Spanish?

17. Describe the difference between Champion of England pea and Veitch's perfection, and wherein do both differ from Exceiior Marrow?

18. Wherein does the Altringham carrot differ from the Long Surrey or Stedley?

ANIMAL PHYSIOLOGY.

THREE HOURS ALLOWED.

Candidates may answer any four of these six questions but only four. If any paper is found to contain more than four questions, marks will be given for the four only of those answers.

1. A piece of bread is eaten. What becomes it? Trace the changes which its constituents undergo in passing through the animal body.

2. State the chemical and physical differences between inspired and expired air. Why does an animal die if it is made to breathe the same air over and over again? How much pure air ought a man of average size to be supplied with per hour, in order that he may not without discomfort?

3. What is meant when animals are spoken of as "cold-blooded" or "warm-blooded"? What is the ordinary temperature of the human body? How is it kept about, and how regulated?

4. In what way does the act of walking differ from running? Explain fully the mechanism in each case.

5. Give a physiological explanation of cough. Mention other animal actions which seem to you to be of a similar nature.

6. Why does a man frown when he is suddenly exposed to a bright light? By what means is the eye able to adapt itself to a varying intensity of light?

(To be continued.)

TECHNICAL EDUCATION.

(Continued from page 604.)

10. From Robert Mallet, Esq., F.R.S.

Offices, 7, Westminster-chambers, Victoria-street, London, S.W., June 11, 1867.

MY LORD,—In reply to the question put to me by circular of the 31st ultimo (signed by Mr. H. J. B. in reference to the letter of Dr. Lyon Playfair of the 15th ultimo, addressed to your Lordship, a printed copy of which was enclosed to me, I beg to state that I do fully agree with Dr. Playfair in opinion that a new system of technical education for all classes connected with industrial pursuits has become a pressing necessity in Great Britain; that immediate steps ought to be taken for organising and securing legislatively such a system; and that large and accurate inquiry as to the state of such education in foreign countries, and as to the way of it at home, ought to be made under such sanction as will be best calculated to rouse the public mind in England from the apathy and ignorance which prevail upon the subject.

The matter is far from new to me. A university education, with a natural love for scientific investigations, the circumstances of my life, in large part engaged me as the active managing partner of large engineering works, and of late years as a civil engineer, a more than common travel and knowledge of foreign countries, their arts and educational systems, &c., &c., have been so convinced me that, unless by a vast improvement in our own educational system, general and technical, the pre-eminence of England (whose power, more than that of any other empire that has ever existed, is based upon her industry) must decline, and with a rapidly accelerating pace, in relation to the other great nations of the world.

For more than twelve years past I have urged this publicly, and in various ways, for which I refer you to many printed documents in various periodicals, &c., and recently to articles by me in the pages of the *Porter's Mechanics' Journal* and *The Engineer's Journal*, and also to my inaugural address, as President of the Institution of Civil Engineers of Ireland, of last year, and to an ad-

dress delivered by me this year before the Society of Foreman Engineers of London, and printed by that Society, &c.

2nd. I do not quite agree with Dr. Playfair in his view of the Paris Exhibition, upon which alone he appears to base his conclusion as to the need of better education, &c.

The degree of representation of the great industries of Great Britain in the Paris Exhibition is no safe test of the relative position of any one industry in Great Britain and abroad. From many circumstances, with which I need not here trouble you, England is in various industries either ill represented, or not represented at Paris at all, while some foreign nations are represented upon a scale preposterously beyond their productive status; for example, in *spinning*, England, the first country as to that in the world, appears almost "no where," while Belgium would, to the superficial eye, appear the greatest spinning country in the world.

My views, therefore, have been formed, not only long before the Paris Exhibition, but independently of it, except in so far as that it has, upon the whole, tended to confirm my previous conclusions. I have, &c.

ROBERT MALLET, F.R.S., M.A.,

The Right Hon. Lord Taunton.

Juror, Cl. 63.

11. (Second Letter).

Offices, 7, Westminster-chambers,
Victoria-street, London, S.W., June 27, 1867.

MY LORD,—I presume it is proposed to pursue the subject of technical education in Great Britain, as raised by Dr. Lyon Playfair's letter, by some form of inquiry. 1st. As to the institutions and methods in operation abroad in several countries for securing technical education. 2nd. As to our needs of such in England, and how these may be best supplied. Having long given attention to these matters, I hope I may not be deemed impertinent if I offer a suggestion as to the *mode* by which, as I conceive, the information desirable under the first head may best be secured.

The countries in which the systems of technical education now working are such as to demand our full acquaintance with them, are France, Prussia, Belgium, Bavaria, Switzerland, and Austria, in the first rank at least these.

In all these countries a large quantity of information exists in the form of state and other printed documents, manuals, brochures, and treatises on education, &c., &c. These should be collected, and a report should be obtained from each country by a technical and learned native professor, in which the system in his country should be described fully and clearly, and a *résumé* given of all the literature of the subject. The six reports thus obtained should go into the hands of some one competent man in England to condense and compare, and report upon, as to *facts only*. You would then have something like an exact basis as to the first head to start consideration upon.

The more usual course with us in England is to send out a roving commission of Englishmen to collect information. From want of familiarity with Continental tongues and habits of thought, and from many other causes, my own observation leads me to think that very little information is thus obtained; and that such commissions are little more than holiday excursions at the public expense. For this I could appeal to some printed reports.

From the other course of proceeding I am satisfied a crop of highly valuable information might be expected.

I have, &c.,

ROBERT MALLET, F.R.S., M.A.

The Right Hon. Lord Taunton.

12. From Peter Graham, Esq. (of Messrs. Jackson and Graham).

29, 33, 34, 36, 37, and 38, Oxford-street, W.
June 20, 1867.

SIR,—I have delayed replying to your circular of 31st

May until I had the opportunity of obtaining information on some points confirmatory of my impressions on the subject of Dr. Lyon Playfair's letter. I agree with him that a system of technical education must tend to the improvement of the manufactures of every country in which it is in operation, and that the advances made by some other countries may to some extent be attributed to its influence. It must, however, be borne in mind that if we have not made the same relative progress as other nations in some branches of industry, we have made greater relative progress in others (the natural consequence of International Exhibitions and greater freedom of trade), and that the Exhibition at Paris does not fairly represent the progress made since 1862, or the present state of several of our most important manufactures.

I may say, briefly, that of all our great textile manufactures the only ones fully and fairly represented are Scotch tweeds and Irish linens.

I apprehend great danger to our manufacturing interests, and to the general prosperity of our country, from the action and influences of trades unions, which tend to reduce, as far as possible, the intelligent and industrious workman to the same level as the stupid and lazy.

I have, &c.,

PETER GRAHAM.

H. J. Roby, Esq., &c., &c.

13. From David S. Price, Esq., Ph.D.

26, Great George-street, Westminster.
June 22, 1867.

MY LORD,—I have the honour to acknowledge the receipt of a letter from the Secretary of the Schools Inquiry Commission, requesting that I would favour the committee by stating whether I agreed with the substance of a letter addressed to your Lordship by Dr. Lyon Playfair, a copy of which was enclosed.

Before proceeding to comply with this request I would wish to remark that Dr. Playfair's letter refers to progress in the peaceful arts, as exemplified at the Paris Exhibition, as a whole, and is general in its conclusions.

My time at Paris was almost exclusively devoted to the jury work of my class, a very large one—chemical and pharmaceutical products—and as yet I have only had an opportunity of examining those other sections of the Exhibition in which I take a special interest, the metallurgy of iron, ceramics, ordnance, &c.; it is, therefore, not possible for me to say whether I agree with the substance of Dr. Playfair's letter. I will, however, state my opinion of so much of the Exhibition as came under my notice, and then venture to give my views upon the second part of the letter, which refers to the subject of the technical education of the working man.

As far as relates to chemical products, I consider that the exhibition made by Great Britain is a "deficient representation," and will not enable foreigners to form a correct estimate of the nature and extent of chemical manufactures now carried on in this country.

In reference to the British exhibition of iron and steel, it must not be overlooked that most of our largest ironworks are unrepresented—Mr. Bessemer's, Coalbrook Dale, Weardale, Earl Granville's, Shelton, Ebbw Vale, Aberdare, Plymouth, and many others too numerous to name; that Sheffield is only represented by two or three makers—a fact that was considered so remarkable at the time that space was applied for by intending exhibitors, that it was brought to the special notice of the Associate Commissioners invited to confer with His Royal Highness the Prince of Wales at the South Kensington Museum; and that which is shown in Class 44 is, as a rule, injudiciously exhibited, contrasting painfully with the taste and spirit evinced by the French in their arrangements in the same class. Great credit is also due to the French ironmasters for the skill displayed in some departments of manufacture, especially in that of girders—a branch of rolling to which our countrymen have not yet so devoted their attention.

Those interested in the metallurgy of iron are much impressed at the wide dissemination which the Bessemer process has attained on the Continent as evidenced in Paris. In reference to the rapid spread of this remarkable invention, it would be instructive if the history of its introduction abroad could be published. The treatment which our eminent inventor has received—more particularly in Prussia—if it were known, might occasion grave reflections in the minds of Englishmen as to how far they are justified in granting the protection of their Patent Laws to the subjects of a kingdom which shows so little regard for the inventive genius of their own. More than this I should not like to state. The finest specimens of Bessemer steel are exhibited in the Austrian department, and are from the Neuberg works.

In connexion with these splendid achievements it may be well to inform your Lordship what I have learnt from Mr. Bessemer respecting the introduction of his process into Austria. Mr. Bessemer informs me that the Government erected model works of his process, and invited the iron and steel manufacturers to inspect them, and to forward samples of their pig-iron, in order to have them tested as to their adaptability for the process. The success of the enterprise is complete, and the Austrians may congratulate themselves upon the brilliant prospect which it promises for the development of their iron industry.

There is one little thing, however, which they have omitted to do, and that is to reward the inventor for the great benefit he has conferred upon the empire. Possibly a knowledge of the history of the iron and steel manufactures in our own country may have afforded both Austria and Prussia a plea as well as a precedent for their injustice and ingratitude to British inventiveness.

It is unnecessary for me to say anything respecting the exhibition made by England in ceramics, as a unanimous verdict of approval has been given as to the manner in which our leading manufacturers have supported the reputation they had acquired at former exhibitions. As regards the British exhibition of ordnance, there must be many opinions as to the merits of our guns, but as regards the display there can be but one, and that is, that it redounds to the credit of the officials at the arsenal.

Before leaving the subject of the Exhibition, I would wish to state my conviction that it is most important that these International competitions should not be allowed to degenerate into a means for advertising; and it behoves those who are entrusted with the organization to see that the several departments of industry are entrusted to men who take an active interest in them, and are thus a guarantee that every endeavour will be made to have them fairly and properly represented, which is not the case on the present occasion, so far at least as refers to Classes 40 and 44.

In reference to the second part of Dr. Playfair's letter, recommending that an official inquiry should be made into the means "by which the great states are attaining an intellectual pre-eminence among the industrial classes, and how they are making this to bear on the rapid progress of their national industries," I would beg to observe that the sooner we are acquainted with the facts the better.

Whilst assenting to the proposition, I must distinctly state that I do not agree with Dr. Playfair that the technical education of working men is the most important method for the maintenance of our industrial supremacy. The information gleaned by acting upon his suggestion would be instructive, and great good would result from its application, but what is really wanted for this country, and is of vital consequence to our future prosperity, is a higher scientific culture of those who are likely, in the natural course of events, to be master manufacturers, so that when discoveries are made they may fructify and not stagnate or decay, as has too often been the case, for want of intelligence the part of those who command capital and works

to perceive their merits; and that they, the managers, may be able to appreciate and adequately remunerate the scientific talent that this country is, and will be, able to afford them.

I would add further, that no reformation bearing on industrial progress is more required than in the culture, and it is a reproach to the country that cannot be represented in Parliament.

It is only a few years since that our classical and commercial statesmen repudiated the idea of the value of coal in England, whilst last year they, in a fit of alarm, organised a commission to inquire into a probable duration.

It would be well if an investigation were made, what have been the results of the teachings in Germany, the German universities; what Liebig has done in modern chemistry, and how the system inaugurated by him at the small University of Giessen has spread throughout the world, and what benefits have resulted from it; what we owe to the teachings of other departments, the physicists, metallurgists, and geologists at the excellent seats of learning. Whilst advocating the necessity for the dissemination of scientific training in England, I must not omit to bestow a passing tribute of commendation to the success of those institutions of recent date which were established to supply a want which existed many years since. I allude to the Royal School of Chemistry, of which the late Prince Consort was president, the School of Mines, and the colleges in the metropolis where scientific departments have been founded. Of the two former I can speak from positive knowledge. In the first named, many of those who have taught, and not a few of those who have studied there, have not only enriched chemical science by their researches, but have left a permanent mark upon the leading industries of this country. From the School of Mines have emanated men who in metallurgy and geology have greatly extended the application of those sciences, nor is this to be wondered at, when we consider the reputation of the professors under whom they have studied. It is, however, a well-known fact that the public do not rightly appreciate the education that this institution is capable of affording, and that comparatively but few of the sons of manufacturers are themselves of its advantages.

Before concluding I would beg to call your Lordship's particular attention to a plan proposed by the eminent chemist, Professor Frémy, of the Institute. It is a most just and wise. He proposes that young chemists of talent, who are desirous of devoting their time to the advancement of science, and therefore for the benefit of mankind (and there are always many, not only willing but anxious to do so) should be liberally supported by the State. I quote the plan from memory, and therefore only give the outline of his project. Permit me to suggest that your Lordship should bring this excellent idea to the notice of the noble and learned Chancellor of the University of London, who from his well-known zeal in the cause of education, and from his position, is better able than anyone else to obtain the evidence of scientific men as to its value, and, if approved, to secure its adoption in this country. The same principle might be extended to the other departments of science which bear upon industrial progress.

In conclusion I must express my firm belief that extended scientific education is of the highest consequence to us if we wish to retain our present position in the scale of nations, that it will mostly benefit the future master manufacturer, that it must tend to elevate the social position of the intelligent working man, and to create a greater sympathy between master and man than at present prevails, and if it do this, the evils which threaten to impede, if not to paralyse, our national progress may be averted. I have, &c.,

DAVID S. PRICE, *Phil.*

The Right Hon. Lord Taunton, &c., &c.

(To be continued.)

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, 1867.

The thirty-seventh meeting will be held at Dundee, and will commence on Wednesday, the 4th of September next, under the presidency of his Grace the Duke of Buccleuch and Queensbury, K.G.

The liberality of various public bodies has placed at the disposal of the Committee excellent and central accommodation for the sectional and other meetings; a large fund has been raised to defray the local expenses; the offers of private hospitality are numerous; special invitations have been given to a number of distinguished foreigners and corresponding members; and every effort will be made to receive and entertain visitors in the most cordial manner.

The reception-room at the Royal Exchange, Panmure-street, Dundee, will be open on Monday, September 2, at twelve o'clock, for the sale of tickets; and there every information will be given to visitors.

Members and Associates are received on the usual conditions.

The opening address will be delivered in the Kinnaird Hall on Wednesday, the 4th Sept., by the President.

Soirées will be held in the Volunteers' Hall, Parkersquare, on the evenings of Thursday, the 5th, and Tuesday, the 10th of September. Evening lectures (by A. Herschel, Esq., on Shower-Meteors, and by A. Geikie, Esq., on the Geology of Scotland), will be delivered in the Kinnaird Hall, on Friday, the 6th, and on Monday, the 9th of September, at half-past eight o'clock.

Excursions have been arranged to take place on Saturday, the 7th, and Thursday, the 12th of September, to the Den of Airlie, Glamis Castle, Rossie Priory, Dura Den and Kilmarnon, Newburgh and Errol Park, Balraddery, St. Andrews, Arbroath, Montrose, Falkland, and Loch Leven. Luncheon has been kindly offered to members of the association at the above places, by the following noblemen and gentlemen:—The Earl of Airlie, the Earl of Strathmore, Lord Kinnaird, Sir David Baxter, Bart., George Armistead, Esq., James Edward, Esq., the University of St. Andrews, the Provost and Corporation of Arbroath, the Provost and Magistrates of Montrose, and the Montrose Natural History and Antiquarian Society, and others. Other excursions are in course of arrangement, and special programmes of each excursion will be issued in the reception-room.

The Sections are arranged as follows:—

- Section A. Mathematical and Physical Science, High School, Centre Hall.
- " B. Chemical Science, High School, Mathematical Class-room.
- " C. Geology, Panmure-street Chapel.
- " D. Biology, High School, School of Art.
- " E. Geography and Ethnology, Albert Institute.
- " F. Economic Science and Statistics, Euclid-street Chapel.
- " G. Mechanical Science, Watt Hall, Constitution-road.

The principal railway companies have consented to convey members and associates at a reduced fare for the double journey. To secure this privilege an early application must be made to the local secretaries, 21, Reform-street, Dundee, for pass-tickets.

Tourists' tickets are issued from London to Dundee, available for return within one month. Fares—1st class, 138s.; 2nd class, 102s.; 3rd class, 56s. each.

METEOROGRAPH AT THE PARIS EXHIBITION.

One of the most interesting objects in the Exhibition is the meteorograph, invented and exhibited by the Director of the Observatory at Rome, Father Secchi, and for which he has obtained the "Grand Prix." This apparatus is perfectly self-acting, and registers, in the form of a diagram, the changes of the atmosphere as they take

place. On each side there is a board, covered with paper, moving vertically in a frame from top to bottom by means of clockwork. On one is registered, for two days and a-half, the indications of the barometer, psychrometer, and the hour and currents of rainfall. On the other board, which completes its course in ten days, the indications of the force of the wind, its direction, the metallic thermometer, the height of the barometer, and the hour of rainfall, are likewise repeated.

The barometer tube is of wrought iron, bored out perfectly cylindrical. The upper part, forming the barometric chamber, is 2.36 inches in diameter, and the tube is 0.69 inches in diameter. This tube floats freely on the top of the mercury, and a great part of its weight is supported by a wooden collar driven on the lower part. The top is attached to one end of a lever, with a counter-weight at the other end; another lever is fixed to near the lower end, so as to keep it always in a vertical position. At each end of the suspending axis is a parallel motion, for carrying the pencil for tracing the diagram in a straight line on the two boards.

The psychrometer, or wet and dry bulb thermometer, for the purpose of determining the quantity of moisture in the air, is registered in the following ingenious manner:—A platinum wire passes through the glass at the bottom of the bulbs, so as to put the mercury in connection with a galvanic battery. The tops of the tubes are open, to allow of two other platinum wires, fixed in a frame, being, at a given moment, plunged into them, and when lowered to the level of the mercury an electrical current is established in the apparatus for holding the pencil to register the temperature and press it against the paper.

A small carriage, carrying the pencil, on which is fixed a Morse instrument, is made to traverse in front of the paper every quarter of an hour. This movement is produced by the striking part of the clock, an eccentric being fixed on the wheel making one revolution each quarter of an hour. This eccentric moves a large triangular-shaped lever; to this level is attached one end of a steel wire, the other end of which is attached to the frame on which are fixed the platinum wires at the top of the wires. In this manner the movements of the carriage and the frame are simultaneous, only the length of traverse of the carriage is greater than that of the frame, it being connected with a point on the lever further from the fulcrum. Thus, when the carriage begins to move, the frame is lowered.

The moment the platinum wire touches the surface of the mercury in the dry bulb thermometer a current is established in the electro-magnet on the carriage, and the armature at the end of a lever is attracted towards it, whilst the other end, carrying a pencil, is pressed against the paper, and marks a point representing the height of the thermometer. The carriage travels on till the second platinum wire comes in contact with the mercury in the wet bulb thermometer; an electric current is established; an apparatus above the carriage breaks the current in the electro-magnet, and the pencil is removed from the paper. In returning, the carriage reproduces the breaking and opening circuit, only in the reverse manner, and another point is obtained, which indicates the end of the line. Thus a double row of points is obtained, arranged on two curved lines, one of which represents the height of the dry bulb, whilst the other represents the wet.

The simultaneous motion of the carriage and frame is established simply by means of a steel wire, and is sufficient for the short distance between the psychrometer and the machine; in some cases, where they are some distance apart, clockwork is used, and cams, as an interruption of circuit, are attached to the clock.

The time of rainfall is marked on the same paper by means of a lever carrying a pencil moved by electricity. The movement of the electro-magnet is produced by a small water-wheel placed under the gutter in a convenient part of the building, and which by revolving opens and closes the circuit of the battery.

The quantity of rain is measured in a reservoir placed at the bottom of the apparatus. The rain-water collected in a funnel placed on the roof passes, by means of a tube, to the reservoir, and raises a float carrying a rod with a pointer, which marks on a graduated scale. At the end of this rod is attached a small chain, which passes over a small pulley furnished with a disc of paper; the rotation of the pulley is in proportion to the quantity of rain. The pencil, fixed on a support, moves along the radius of the disc at the rate of about 0.20 inches per day, and in this manner the quantity of rain is marked each day on the wheel at a different place.

The reservoir is 7.48 inches in diameter, whilst that of the funnel is 14.96 inches, or four times the area; thus the height marked on the scale is four times that of the actual fall.

The direction of the wind is registered by four telegraphs. At the foot of the weather-cock is placed a circle with four metallic sectors, covered with platinum, against which a small projection on the axis is pressed.

The apparatus is provided with four telegraphs, the electro-magnets of which are respectively in communication with the four sectors; each of these four telegraphs, by vibrating its lever according to the direction of the weathercock, connects the circuit, and gives one of the four cardinal points. The register of intermediate winds is obtained by the combination of the two neighbouring ones. A vibration of the rod to which the pencil is fixed is produced by each revolution of the vane, for measuring the velocity of the wind.

The velocity of the wind is measured by the anemometer invented by Dr. Robinson, which consists essentially of four hemispherical cups, having their diametral planes exposed to a passing current of air; they are placed at the end of four horizontal arms, attached to a vertical shaft or axis, which is caused to rotate by the velocity of the wind. On this shaft an eccentric is fixed, by means of which a succession of currents in opposite directions is produced. The apparatus is provided with three counters, which are put in motion by the electrical current, which passes by the middle counter, whatever may be the direction of the wind, and at each revolution of the vane the escapement wheel of the counter is advanced one tooth by means of the electric current. This counter gives the number of revolutions of the vane; this is reduced into kilometres on the second dial of the counter. The velocity of the wind each hour is noted on the diagram, fixed by means of a chain, which is wound more or less, according to the strength of the wind, on a pulley. This chain is connected with a parallel motion, to which is fixed a pencil. This pencil, drawn by the chain, traces a line more or less long, corresponding with the length of chain wound on the pulley. This pulley is thrown out of gear every hour by means of an eccentric fixed on the striking part of the clock, and by means of a counter weight the chain is unwound, and the pencil makes its mark on the paper.

The metallic thermometer consists of a copper rod, the expansion and contraction of which act on a lever, which communicates with a pencil for tracing the curve corresponding with the variations of temperature on the paper. This rod is 52 ft. 6 in. in length.

An apparatus on the same principle has been at work for the last seven years at the Observatory at Rome, with most satisfactory results, and an atlas of diagrams registered by it is exhibited.

The galvanic battery used is a modification of the Daniell battery, with sand.

The clock and wheel-work of the counters were made by M. Détouche, of Paris; the other parts by M. Eren-Brassart, of Rome. The wood-work is by M. Pirotocola, of Rome. The barometer tube, which is a forging requiring great care, made like a gun-barrel, was constructed in the workshop of M. Mazzocchi, gunsmith, of Rome.

Fine Arts.

INTERNATIONAL ARCHITECTURAL CONGRESS.—The Imperial Central Society of Architects of France have initiated a series of conferences, the first of which took place a few days since. M. Baltard, Member of the Institute of France and President of the Central Society, opened the proceedings with a complimentary notice to the attendance of foreign architects, and a discussion on all points raised. The first question discussed before the meeting was, "What, in an architectural point of view, is the actual condition of architecture amongst modern nations, and what tendencies?" M. A. Hermant opened the discussion by arguing that the tendencies of the age were towards scientific and industrial, and that such tendencies produced an almost universal eclecticism, which became the dominant characteristic of the architecture of the 19th century; and that industry inevitably raised the useful above the beautiful, which was a favourable condition for the manifestation of style. At the second meeting, held some days later, the question discussed, the conference generally adopting M. Hermant's view. The second question, opened by M. Baltard, was, "What are the methods of instruction at present in use?" M. Baltard showed that old times young architects were trained by masters to whom they were in close and intimate relation, and afterwards such training was completed by special study and competitions in public schools. M. Hermant strongly advocated the development of technical study. M. Boeckmann, of Berlin, explained the system adopted in his country, and mentioned as a special fact that no distinction was made between architecture and civil engineering. The third question of discussion was, "The position of the architectural society, taken from a professional point of view." The fourth, "The influence of architecture on the progress of industry." The conferences were held four in number, and there was a general hope that the architects of various nations should be brought into more frequent communication. Several names, such as a Russian, and a Portuguese architect present in the proceedings, but no English name appears.

ENCOURAGEMENT TO ART IN FRANCE.—Madame Troyon, mother of the late admirable artist, has been elected to the Academy of the Beaux Arts of Paris to receive an annual prize of 600 francs, or a biennial of 1,200 francs, the amount, to be called the "Prix Constant Troyon" for the assistance and encouragement of French artists whose age shall not exceed thirty years. The late artist has accepted Madame Troyon's offer.

Commerce.

THE STATE OF EGYPT.—The following is extracted from the report of Mr. Consul Stanley, on the trade and commerce of the port of Alexandria for the year 1866. "The development of the railways, and the introduction of steam power for irrigation and cotton gins and presses, have added largely to the coal required in the country; and the wealth of the people, consequent on the profits derived from the cultivation of cotton, has largely contributed to the general use of British manufactured goods amongst the rural population. The two items are almost wholly carried in British ships, and, in 1862, when cotton was first planted, there was almost total exclusion of cereals, the increase in the number of British vessels over the preceding year was extraordinary. This increase has been since maintained. The year opened with good prospects for cotton, the price here for 'Fair' being 23s. 6d. on the 1st of January, and the quantity shipped in the first three months reaching 71,500 bales, of which upwards of 33,000 left in the month of March. News from Amer-

shipments from America. This, combined with the monetary panic in England, greatly to value, which, in November, fell to 16d., a of 9d. from the highest rate of the year, 24d. at the end of March. The new crop first for shipment in October will show a large difference, both in quantity and quality, compared to what first anticipated. The value of the shipments is less than half the value of the shipments in 1865, quantity sent to England, 946,000 cantars, £5,825,000; to other countries, 207,000 cantars, £1,271,500; making a total of 209,000 bales, £7,096,500, in 1866; against £15,839,100 in 1865. The present condition of the agricultural of Egypt has been so entirely diverted from its normal state, that any person going through the country to take a view of the soil would be altogether misled. The profits which were realised by the growth of cotton during the American war have caused this. The Cotton Supply Association sent a memorial to the Viceroy, Said Pasha, praying his Highness to make every possible effort to encourage the cultivation of cotton, the reply was characteristic, and evinced a correct sense, and almost a prophetic dread of the revolution which would be produced by an immoderately raised price for cotton. He said, 'Prices alone will be a sufficient stimulus without any effort on my part, but God forbid that I should ever see the moment of the ordinary succession of crops for the production of cotton, to the exclusion of those products which we subsist.' Within a short period from that Egypt, which had ever been a large exporter of cotton, of beans, &c., had to seek food from other countries, became an extensive importer; grain was considerably dearer in the interior than at Alexandria; in places absolute famine ensued. An undesirable result was wrought, the recovery from which will be as long as its accomplishment was rapid. The value of cotton was quadrupled; wages rose in an equal ratio; workers earned so easily sufficient for their wants that they became indolent; an excessive luxury sprang up, that not of a nature to benefit the commercial class, being displayed in a demand for white slave girls, pipes, and other such appliances, which do not benefit the industrious world without. Meanwhile the land, from the constant crops of cotton in succession, has become impoverished. Cotton, however, has long been, and must continue to be, the most important production of Egypt. It is sown in March or April, and arrives at maturity in August or September. Average yield in good summers is 300lb. to the acre; New Orleans variety has been found to yield 800lb. to the acre; but it is found unmarketable, and is therefore not cultivated. Cotton seed has also become an important source of profit. In 1858 the arabic of 270lb. for 25 tariff piasters, now it sells from 65 to 75 piasters. Formerly it was not of sufficient value to justify its being sent to Alexandria, and it was used as fuel. Now it is all shipped to Europe, and from it is pressed an excellent oil, and from the refuse a cake is made which is said to be more nutritious than linseed cake."

THE SUPPLY OF GUANO.—At the recent meeting of the Highland Agricultural Society at Glasgow, Professor Anderson referred in a lecture to the complete exhaustion of guano from the most northern of the Chinese islands, and to the inferior quality of guano now obtained from the southern island. The farmer buys for his money a smaller quantity of fertilizing matter than he formerly did; the effect, however, will scarcely be felt in the first crop, but must ultimately tell to disadvantage from the deficiency of residual fertilizing matter

left in the soil. As the demand for real Peruvian guano is not increasing, there is a fair prospect of its lasting for a generation to come, but at the end of that time the supply of nitrogenous manures must become a very grave question, seeing that the ammonia contained in the Peruvian guano annually imported is equivalent to about 120,000 tons of sulphate of ammonia, greatly exceeding the quantity of that substance at present derived from all other sources put together. Hope lies in the increased manufacture of ammonia in gas works and in various processes of the arts, and also in the gradual reproduction of natural guano—of which we have an instance in the renewed supply from Ichaboe, an island exhausted about 30 years ago. The lecturer showed how analysis and the system adopted by importers have checked and almost destroyed the practice of adulteration; he then noted the improvement in quality and the diminution in price which have been latterly found in superphosphates, due in great part to the introduction of bone ash and mineral phosphates. Dissolved bones may be said to no longer exist: we now get a mixture of these with bone ash or mineral phosphate; and, by an improvement in the process of manufacture, the manure is much more finely reduced, and more convenient for application than it used to be. So far as the supply of phosphates is concerned, Professor Anderson feels no anxiety, new mines of these substances being continually discovered, and often in the most unexpected geological formations.

Colonies.

NATAL HORSES FOR INDIA.—The following is extracted from the *Natal Mercury*:—"Horse-breeding is represented by those farmers that pursue it as being about as satisfactory and profitable an occupation as any in Natal. Of course certain conditions are requisite. Pasturage and locality must be adapted to the pursuit; but there is said to be no lack of either in the midlands and upper districts of this colony. Horses are so much more valuable than cattle or sheep, that greater care can be devoted to the charge of a small number. They can be more tenderly handled, and more completely guarded from the inclemencies of the climate. Horses have multiplied marvellously during the last few years. Fifteen years ago it was a rare phenomenon to see a Natal kafir mounted. Now, few things are more common. The streets of Maritzburg are pervaded by half-dressed savages bestriding weedy, but often sturdy little nags. On the lands lying nearer the Drakensberg most of the kafirs have horses; and some of the chiefs in Weenen and Klip River counties can turn out a regiment of mounted followers. The blue-book returns also show how fast the stock of horses in Natal has increased in numbers. So numerous are horses getting that the breeders find it difficult to get a market for them. Hence their anxiety at this time to open up India as an outlet for sale. Major Erskine and Col. Pennesfather have severally initiated the movement, and the farmers have jointly taken it up. They say they are quite ready to supply horses according to the prescribed conditions, but as regards shipment and disposal, these being commercial matters, they leave business men to undertake that part of the work. A correspondent, who proposes himself to be a seller, says that the farmers can and will find the horses, and supply the food, and further, they agree to let all expenses incurred be a first charge upon the proceeds of sales. Consequently, the shippers will run no risk—unless, indeed, the horses are lost on the way. This proposal, therefore, deserves to be considered by some of our merchantmen, who are so often complaining of the want of exportable commodities. The commercial community is bound to co-operate with the producing classes in such a movement. Nor ought they to be supine. By good luck Natal has won the favour of the Indian government as regards horse supply, in

the teeth of the prior claims and older reputation of the Cape Colony. In the latter, public attention is again being directed to the project, and the fact that Natal has stepped in and anticipated her elder sister, is cited to the discredit of the latter. It will be yet more to our discredit if, having won the preference, we lose it, or fail to make good use of it. Australia is as alive as the Cape now is to the advantages presented by India as a market for horses. But there is another reason why prompt action is expedient. The Persian authorities have just removed certain restrictions from the sale or exportation of horses, and the Arabian ports are open for the shipment of the fine animals for which the Indian service was formerly renowned. Our last Bombay papers make much of this fact, and it may possibly affect in some degree the readiness of the government to purchase Natal horses. Madras, however, is open to us as well as Bombay, and the success of Captain Linthorne's speculation gives fair encouragement for a repetition of the venture. To succeed in this movement, our breeders will of course have to aim at excellence in blood and quality. They know what stamp of horse is needed. They know that they can rear it. It will be for them to effect yet further improvement, and make a study of what may hitherto have been more a pastime than aught else. The rearing, training, and perfecting of so noble a creature as the horse, is an employment worthy of any man's powers, and if a fair sale be ensured for the results of labour, we may expect to find this branch of enterprise extensively followed. Since penning the above the Howick resolutions have reached us, and we are glad to find that matters are so far matured by our enterprising breeders, and that no more time will be lost.

THE GRASS TREE.—A correspondent of the *Melbourne Argus* speaks of having seen a sample of a square-headed broom, made from the colonial grass-tree, and produced by machinery, which will turn out the article in any quantity that may be desired. It appears to be admirably adapted (says the writer) for the general purposes of a household broom, and has been already brought into extensive use in some localities. The broom has been used by puddlers for sweeping out their machines, and this severe test speaks well for the durability of the new industry.

MINING IN SOUTH AUSTRALIA.—The great question of the day is the peculiar position of the mining interest. The renowned Burra Burra mines, which have added four millions sterling to the exports of South Australia, are closed, and the whole of the newly-developed mining interest in Yorke's peninsula (where more than 10,000 people live exclusively dependent on the mines) is threatened with sudden extinction by the stoppage of the hitherto prolific Moonta mines, consequent on an injunction granted by the Supreme Court, prohibiting a distribution of profits, causing the withdrawal of all accommodation by the bankers of the mine.

GOLD IN NEW SOUTH WALES.—The diggers everywhere are doing well, and the yield of gold during the month is in excess of that of last month. At Emu Creek a gold reef has been struck at some distance from the old workings, and gold obtained in more remunerative quantities than ever. There is but one crushing machine on the ground, and that is of very inferior construction.

SUGAR IN QUEENSLAND.—A letter from Mr. Walter Hill, curator of the Botanical Gardens at Brisbane, which has appeared in a colonial paper, says:—"The several experiments made in the cultivation of the sugar cane in Queensland during the last two or three years have sufficiently proved the practicability of the enterprise, and fully justified the hope that, ere long, the youngest of the Australian group will creditably compete with England's most favoured East and West Indian possessions in the cultivation and export of sugar. The question as to the capability of the colony to grow the sugar cane having been decided in the affirmative, the next

—if not the only important—question to be asked is the nature of the soil best adapted to the growth of the sugar cane in Queensland, and the varieties of cane which are likely to admit of the most profitable cultivation. It is true the experiments made are comparatively very few in number, and it can even be doubted whether the varieties hitherto adapted to the peculiarities of the Queensland climate have been tried at all. My experience, however, as it goes, embraces several very highly successful varieties of cane, which, in the West Indies, where, as regards the cane, are regarded as the chief staples of the trade, and in nearly every instance the experiments have been eminently successful. The first, and hitherto the most important sugar plantation established in Queensland, is that of the Hon. Louis Hope, at Pimpama, near Ipswich. If I remember rightly, it has been in operation about three years, and during that period it has produced some fine crops of various descriptions of cane, including the varieties known as the Ribbon, the Batavian, the Ribbon, and Batavian, which are the most prolific and valuable in their secretion of saccharine matter. The soil in this plantation is slightly elevated, and of a dark-reddish chocolate colour, with a mixture of volcanic debris, and characterised by a dryness rather than moisture. When properly prepared, the soil is adapted to all kinds of sugar cultivation, particularly to the growth of those cane varieties which are short-jointed and swollen stemmed; which, in comparison with the elongated jointed, generally produce a much greater density of juice, or larger quantity of saccharine matter. Among those which flourish best are the purple violet, or Java, and the Diard rose cane, both of which are short-jointed. Of the elongated, as next in rank to the short-jointed, are the white or yellow cane of the Mauritius, or Bourbon cane, and the Guingham or Mauritius cane of Batavia. The next plantation in Queensland is that of Messrs. Raff and Co.'s, at the Caboolture, comprising about 130 acres under cultivation. The soil here is a very moist black alluvial, of considerable depth and richness, and the elongated cane varieties, in consequence, attain a most exuberant growth. They reach a height of from fifteen to twenty feet in eleven months, and, although this may be taken as a general indication of success in the cultivation, it by no means a favourable criterion of the density of the juice or richness of the saccharine secretion. The excessive of the woody growth in height, the time generally is the juice. These, as well as the short-jointed canes, however, possess one very important advantage, in the fact that their stolons (the stems which grow from the roots whence the plant cane, or original, cane, throw up suckers or ratoons in larger numbers than the original cane). To say, the experiments at Cleveland show that the ratoons in the short space of nine months attained a greater density of juice than the original canes did in sixteen or eighteen months, thus showing that the young ones are the medium of steady and progressive improvements. It may be mentioned that all the varieties of canes planted at the Caboolture, although not nearly so numerous as those grown at some other parts, have thriven exceedingly well. Several other plantations have also been established within the last eighteen months, among which may be mentioned one at Pimpama, one at the Allendale, at the Caboolture, several at Maryborough, one at Pioneer, one at Port Denison, and one at Rockingham Bay, in all of which cases the progress of cultivation has been extremely encouraging, and suggestive of the most brilliant hopes for the future. From the facts now developed by experience, one thing seems very certain, namely, that the whole belt of land along the coast from one end of the colony to the other is peculiarly suited for sugar cultivation."

QUEENSLAND COTTON.—The quantity of cotton raised

and during the past three seasons is as follows:—28,730lbs.; in 1865, 145,820lbs.; first ten months 183,630lbs. A much larger area of ground is in cultivation for the season of 1867. Forty bales of the first picking of this season, has already been sent to Brisbane from the Townsville cotton plantation, one of the largest in the colony, situated thirty miles from Brisbane. It is estimated that from this plantation alone will be about 670

INTERCOLONIAL EXHIBITION AT MELBOURNE.—The ticket has been taken in this Exhibition. The number of season ticket-holders was 4,244, who visited the Exhibition 92,331 times. The amount received for tickets was £3,004 15s. The number of gratuitous visitors was 15,038 to exhibitors. The number of at the door was 124,175, paying £6,829 15s., with the season-tickets, £9,834 10s. The number of visits paid amounted in all to 252,404, out of a total of about 650,000.

PRODUCTIONS IN VICTORIA.—Grain and every kind of agricultural produce are very abundant, and prices are generally low. Wheat averages about 40s. per quarter, and at that price shippers are still buying for export. In some parts of the colony wheat is worth more than 24s. per quarter, owing to the distance from the market. Bread is now cheap everywhere. A committee of stockowners has been formed at Riverina, for the purpose of erecting an establishment at Hay, capable of slaughtering down 10,000 sheep weekly. Formerly there was a great loss of fat beef in the colony than could be consumed, the number of cattle in Victoria has been decreasing for many years past, sheep having been found more profitable, so that Victoria is now partly dependent on the neighbouring colonies for the supply of beef; therefore, cattle will be boiled down, nor will the colony be able to enter largely into any project for preserving and exporting meat.

Notes.

PROPOSED CO-OPERATIVE CONGRESS IN PARIS.—The authorities have refused permission for the meeting of the International Co-operative Congress proposed to be held in Paris this year, at the suggestion of the *Comité du Crédit au Travail*.

ACROBATIC EXPERIMENTS.—So many extraordinary attempts have been made to control balloons, and generally with such lamentable results, that anything new in the way of acrobatic experiments mostly calls for a smile. Still, when a man of acknowledged ability takes up the subject seriously his efforts deserve notice, and such seems to be the case with M. Henry Giffard, the inventor of the famous steam injector. It was that in 1852 this gentleman made an ascent in the Hippodrome, seated on the tender of a small steam-engine, suspended to a cylindrical balloon. Preparations are now being made by the same gentleman for raising a balloon of sufficient size to carry a number of persons, principally with the view to scientific experiments. M. Giffard proposes to make his balloon captive during these experiments, and for this purpose he has made a cable 300 metres long, and weighing a ton. The plan adopted by M. Giffard is not made known, but the importance of the experiment may be indicated by the fact that two steam-engines, of about 20-horse power each, form a part of the material prepared. The experiments are to take place within a large circular enclosure, which may be seen from the gate of the Exhibition in the Avenue Suffren.

THE PUBLIC GARDENS OF PARIS.—There are in Paris, besides the parks, twelve gardens thrown open to the public; and the following are the particulars of their size and the cost of their formation:—The Garden (or Square, adopt the Paris name) of the Tower of Saint Jacques measures 6,785 square metres, and cost 141,700*fr.* The

Square des Innocents, which contains the fountain decorated with the nymphs of Jean Goujon, measures 1,957 metres, and cost 201,580*fr.*, which includes, evidently, the restoration of the fountain. The Square of the Temple measures 7,524 metres, and the cost was 148,580*fr.* The Square Vintrille, the first formed in Paris, was purchased by the authorities several years since, and was transformed at a cost of 13,500*fr.*; this square is only 778 metres in extent. The Square Sainte Clotilde, in front of the church of that name, measures 1,733 metres, and its construction cost 32,229*fr.* The Square Louvois, in the Rue Richelieu, covers 1,776 metres, and the expense of its transformation was 56,000*fr.* The square recently formed about the expiatory chapel of Louis XVI. and Marie Antoinette is 6,165 metres in extent, and cost 183,000*fr.* The Square of Belleville measures 12,100 metres, and the expense of its transformation was 20,000*fr.* The Square Montholon measures 4,300 metres, and cost 185,000*fr.* That of Montrouge, 7,100 metres, cost 101,500*fr.* That of the Arts-et-Métiers, in the Rue Saint Martin, 4,112 metres, cost 320,000*fr.* The largest of the new squares, or gardens, is that of Batignolles; it measures 15,000 metres, and the laying out cost 155,000*fr.* The whole of these gardens form, together, open spaces in the centre of the city measuring about seventeen acres, and the whole expense of their establishment, or conversion, amounts to about £63,000.

ABOLITION OF IMPRISONMENT FOR DEBT IN FRANCE.—The French legislature has totally abolished imprisonment for debt; and the other day the doors of the debtors' prison at Clichy, in Paris, were thrown open, and the same was of course done in the provinces. The number of persons confined at Clichy amounted to little more than sixty.

THE DIRECTOR OF THE PARIS MINT.—M. Dumas, chemist and senator, has been appointed to succeed the late M. Pelouze, as director of the *Commission des Monnaies* of Paris. M. Dumas had previously resigned his appointment of professor in the faculty of science in the University of Paris, and inspector-general of the high schools of France.

SAFETY FOR RAILWAY TRAVELLERS.—It is said, on the authority of a French journal, that it has been determined to enforce the establishment of a foot-board, provided with a hand-rail, along the whole length of every train, in order that conductors, as well as passengers, may have the means of escaping from the attacks of malefactors or danger from fire; such a plan has been partly carried out on the northern and southern railways of France.

Journal of the Society of Arts.

FRIDAY, AUGUST 23, 1867.

Announcements by the Council.

ARTIZANS' VISIT TO PARIS.

Her Majesty's Government have granted to the Society of Arts, in aid of the fund now being raised by the Society for assisting workmen, specially selected from various trades, to visit and report on the Paris Exhibition, the sum of £500, conditional on the Society raising a like amount by public subscription.

The following is the list of subscriptions up to the present date :—

H.R.H. THE PRINCE OF WALES, President ..	£31	10	0
HER MAJESTY'S GOVERNMENT (conditional) ..	500	0	0
Society of Arts	105	0	0
Earl Granville, K.G.	5	0	0
Lord de L'Isle	10	0	0
Thomas Twining	2	2	0
Sir J. P. Boileau, Bart.	5	0	0
George Godwin, F.R.S.	1	1	0
Vice-Chancellor Sir W. Page Wood, F.R.S. ..	10	0	0
Sir W. H. Bodkin (Assistant-Judge)	3	3	0
Sir Rowland Hill, K.C.B.	3	3	0
Benjamin Shaw	2	2	0
Alfred Davis	10	10	0
Eugène Rimmel	5	5	0

Total	£1,003 4 0

Messrs. J. M. Johnson and Sons have kindly placed at the disposal of the Council a number of their five-shilling English Catalogues of the Exhibition, sufficient to present each workman with a copy.

Subscriptions may be forwarded to the Financial Officer, at the Society's House.

The Council are now prepared to receive the names of any workmen recommended by their respective trades as fit and proper persons to undertake this important duty on behalf of their fellow workmen. A certain number have already been selected, and some of them are now in Paris.

Proceedings of the Society.

SOCIETY'S VISIT TO PARIS.

In making the arrangements for the members visiting Paris, it was considered that it would add materially to their convenience if they had the option of acting independently or of joining in parties to visit this or that establishment. On former occasions considerable difficulty was found in planning concerted arrangements, so as to suit the time and engagements of a number of persons. On the present occasion it was therefore determined to leave matters as far as possible in the hands of members themselves, who, with their cards of membership, could visit, singly or in parties, the various establishments whose proprietors or directors had courteously acceded to the request made by the Council of the Society for facilities of inspection. Nearly two hundred members took out their cards of membership; and very interesting visits, sometimes singly and sometimes in parties, were paid to various manufacturing establishments and other objects of interest in the French capital.

A party one morning paid a visit to the great Horticultural establishment in the Bois de Boulogne, belonging to the municipality of Paris, to whose care the public places and gardens of the city are entrusted. In this establishment are reared, at the public charge, the various plants and shrubs with which the city is so profusely adorned.

Through the kindness of the Prefect, permission was given for a small party of the members to pay a visit to the sewers. The party was received at the Place du Châtelet, and on descending a spiral iron staircase they found awaiting them some small, low carriages, travelling on rails laid on each side of the channel in which the sewage runs at the bottom of the great subterranean tunnel. The tunnel is well lighted, and the carriages had each four moderator lamps attached to them. These carriages, as soon as the party were seated, were pushed along by men who ran

on each side. Over head were seen the large iron tubes for the conveyance of the water supply, one set of tubes carrying the drinking water, and the other that for general purposes, it being found necessary to have the two services in order to economise that of the best quality. At the top of the tunnel were seen the various wires for the telegraph service of the city. The sewer is well ventilated; and, notwithstanding the journey was performed over the surface of the sewage, there was but little disagreeable odour.

The tunnel, or large collecting sewer, passes from the Place du Châtelet, beneath the whole length of the Rue de Rivoli, as far as the Rue Royale, when it follows the course of that street. At the commencement of the Rue Royale the party were transferred to a barge, which conveyed them along the line of that street, and they emerged into the open air by the Madeleine, by a spiral staircase, similar to that by which they had descended.

To the carriages, as well as the barges, are attached arrangements which act, when required, as temporary dams or sluices, by means of which the flushing of the sewers is effected.

The gas service is not conducted through this tunnel, the authorities fearing accumulations of gas might take place, in the event of leakages, and explosions occur. Looking at the construction of this tunnel, and the manner in which the lateral connexions are formed, it is obviously just possible, in spite of the excellent ventilation, that an accumulation might take place at the crown of the sewer, and the precaution is no doubt a wise one. In Nottingham, where the gas mains are laid in the subways; they are so constructed that the escape always takes place at the highest point, and hence no accumulation of gas can take place.

The sewage is conducted to the outfall into the Seine at Asnières. Although at no great distance from Paris in the straight line, it is many miles distant following the windings of the river. It is understood that attempts to utilise the sewage have not hitherto been attended with much success.

A large party on a subsequent day visited the Catacombs.

A party also visited the new reservoirs for the water supply of Paris, at Monilmontant, and were much interested in these splendid monuments of engineering skill.

A visit was also paid to the workmen's houses in the Avenue Daumesnil, now being constructed for the Emperor of the French, by Messrs. Newton and Shephard. They are built of concrete, on Mr. Shephard's system, as described by Mr. Newton in the *Society's Journal*, p. 317. The party were conducted over the buildings by Mr. Newton, junior, who explained very fully the method of these constructions.

The efforts which are now being made to provide economical houses and lodgings in Paris, and which are warmly supported and encouraged by the Emperor, offer valuable opportunities of study. The experiment now being made by order of the Emperor is of considerable extent; forty houses are about to be erected on the model of one already completed in the Avenue Daumesnil. Each house comprises three sets of apartments on different floors, and each apartment three rooms, including a kitchen, with a cellar. In the rear of the houses will be a garden, or promenade, common to all the inmates of the forty houses. This colony is intended for a co-operative association of working men, and is but the prelude to far more extensive operations. Near Bercy the experiment is being tried in another form; two hundred houses, constructed in like manner, and of which twelve are now in progress, are to be erected, each for a single family, having three rooms, besides the kitchen and cellar, and standing each in its own garden. The rent of each of these houses is fixed at 75 centimes, little more than 7d per day, and at the end of ten years, it becomes the absolute property of the tenant. The intention is said

to be to erect twelve thousand houses of this class in various parts of the outskirts of the city.

A party also visited a large house, now in course of construction in the Rue de Naples, Boulevard Mals-herbes, building on the system of bétons agglomérés—a special description of concrete—by M. Francois Coignet. The party were shown over the building, and its mode of construction was explained to them by the director of the establishment. The question of building in concrete is now attracting much attention, and the system seems worthy of the consideration of our architects and engineers. The Coignet system has now been in operation for about ten years in Paris, and large public works, churches, sewers, and barracks, have been satisfactorily executed. The subterranean galleries of the Exhibition are all built upon this system. In the building over which the party went, they were shown a well staircase, serving six stories, which was in fact one piece of artificial stone; indeed, the house itself, from bottom to top, is in reality one vast monolith.

Proceedings of Institutions.

CHORLEY MECHANICS' INSTITUTION.—The tenth annual report congratulates the members on the continued prosperity of the Institution. The number of members for the past year has been—Honorary, 34; newsroom, 94; ordinary, 85: as compared with—Honorary, 37; newsroom, 87; and ordinary, 97; in the preceding year. The ordinary attendance at the night school during the past year has been about 35. An examination in connexion with the Lancashire and Cheshire Union of Institutes was held, when seven candidates were presented for examination, of whom three succeeded in obtaining certificates, and to whom local prizes have been awarded. The number of volumes taken out of the library during the year has been 800, as compared with 791 in the previous year. There have been ten penny readings during the winter months, which have been so far successful as to realise a profit of £5 17s. 6d. The accounts show that the expenditure has been £113 15s. 6½d., and that there was a deficit of £8 9s. 7½d.

EXAMINATION PAPERS, 1867.

The following are the Examination papers set in the various subjects at the Final Examination held in April last:—

(Continued from page 612.)

DOMESTIC ECONOMY.

THREE HOURS ALLOWED.

SECTION I.

1. Describe the best method of remedying the evil of smoky chimneys, and the causes which produce it.
2. Mention some of the bad effects of defective draining in human dwellings, and by what means, not very expensive, you might improve the ventilation of a close room.
3. Give clear directions to a young cook as to the faults to be guarded against in common culinary operations.
4. Give directions for roasting meat.
5. Give a receipt for Irish stew.
6. Give a receipt for cheap soups.
7. Give a receipt for making and boiling a plum pudding.
8. Give instances of waste of food, and directions how to use articles commonly wasted.
9. State the most important circumstance to be attended to in a poultry house.
10. What varieties of fowls are to be recommended for eggs only, for market fowls, and for general purposes?
11. Explain what is meant by hard water, and how the hardness of water may be reduced.

12. For what uses is hard water objectionable, and for what unobjectionable?

13. What is the composition of soap? Explain its action in cleansing articles by washing, and the precautions that ought to be observed in purchasing and keeping it.

14. What ought to be the yearly cost of clothing a girl between 14 and 16 years of age, the daughter of a mechanic, or of a day labourer? Support your opinion by a detailed estimate.

15. If a mistress saves one-fourth of an income of £100 during five years, and invests that sum, and the interest accruing therefrom, regularly in a savings bank at 2½ per cent., what sum will she have at the end of the time?

16. Explain what is meant by "deferred annuities," and the advantage of them.

17. Write out a table of troy weight and of avoirdupois weight, and state the purposes for which these weights are respectively used.

18. Write out tables of cloth measure and of measures of capacity.

SECTION II.

1. Write an essay on the duties of a maid of all-work.
2. Write a letter of advice to a girl about to take the place of kitchen-maid or nurse-maid.

POLITICAL AND SOCIAL ECONOMY.

THREE HOURS ALLOWED.

Questions from Stephens's Commentaries.

1. Under what circumstances is a master not bound by, or liable for, what his servant does, though it may be done in the course of or in relation to the service?
2. How far and for what purposes, and under what circumstances, has an infant the power of binding himself by contract?
3. In what way were Acts of Parliament prepared and drawn up before the time of Henry the Fifth; what alteration was made in his reign; and what is the form of enacting words now in use?
4. What is the meaning of going into committee upon a bill in the House of Commons, and what is the mode of proceeding therein?
5. What is the present position of Jews in England, in regard to their civil and political rights; and has any change in regard to them been made since the year 1853?
6. What are the provisions of the Royal Marriage Act; and when was it passed?
7. Can an army be lawfully maintained without the consent of Parliament? In what way is that consent given; and what are the Articles of War; and by whose authority are they made?
8. When and in what way were justices of the peace substituted for conservators of the peace; in what way are they appointed; and what is the meaning of the expression, "one of the quorum?"

Questions from Professor Fawcett's Manual for those who aspire to a First-class Certificate.

1. What are the elements of which profits consist; and what are the causes which determine their average rate?
2. What are the economical disadvantages and advantages (if any) of slave-labour?
3. What is the connection between the rate of profit and the rent of land?
4. In what way can the increased demand for a manufactured article diminish its price?
5. Under what circumstances and by what means can trades' unions affect the rate of wages?
6. What is the total amount of gold which has been produced from Australia and California, and what effect has it had upon prices?
7. State the argument for subjecting professional incomes and those arising from permanent property to the same rate of income-tax.

GEOGRAPHY.

THREE HOURS ALLOWED.

1. Enumerate, in geographical succession, the principal rivers upon the east and west coasts of Great Britain respectively; distinguish those amongst them which have the largest areas of drainage, and name the principal tributaries of these latter.

2. Describe (with reference to outline, surface, drainage, mineral produce, and chief towns), or, if you prefer it, draw a map of, any one county either of Great Britain or Ireland.

3. Give a brief account of the principal mountain systems of the European continent; also of the principal lowland plains.

4. Describe briefly either one of the following countries:—France, Spain, Italy; with reference to outline, features of surface, river-basins, climate, produce, and chief towns.

5. Make a list of the countries of Asia, naming the capital, and (in the cases of maritime countries) the chief seaports, of each.

6. Write a brief account of the rivers Yang-tze, Ganges, Euphrates, and Obi—as to course, outlet, comparative area of basin, and chief tributaries.

7. Enumerate the various Australian colonies, with their principal towns; also say in what the natural resources of each mainly consist.

8. Draw a map either of New Zealand or of any one of the Australian colonies: if of New Zealand, mark on it the different provinces.

9. Give a brief account of Canada and the adjacent provinces of New Brunswick and Nova Scotia—as to extent, surface, climate, productions, and towns.

10. In what parts of the world are the trade winds experienced? In what region do monsoons occur? What is the characteristic difference between the two? How are these winds respectively accounted for?

11. How is the geographical distribution of plants affected by latitude? Mention some of the characteristic food plants proper to the Old and New Worlds respectively.

12. Amongst the *carnivora*, what characteristic differences are met with in comparing the animals native to the Old and New Worlds respectively? What orders (in the list of *mammalia*) are wanting in the zoology of Australia? To what order do the native mammals of Australia almost exclusively belong?

ENGLISH HISTORY.

THREE HOURS ALLOWED.

GENERAL QUESTIONS.

1. Give the dates of the following events:—The invasion of this country by Julius Cæsar; the supposed landing of Hengist and Horsa; the consolidation of the Heptarchy; the accession of Alfred the Great; the appointment of Dunstan to the see of Canterbury; the accession of Canute, and of Edward the Confessor; the commencement of the several dynasties which have occupied the throne of England from the time of the Conquest to the present day.

2. Mention the most eminent sovereigns of the several dynasties, and state the reasons for your selection.

3. In what reigns did the following events take place:—The conquest of Ireland; the conquest of Wales; the battles of Cressy and of Agincourt; the grant of Magna Charta; the establishment of the House of Commons; the union of the Roses; the Reformation; the Great Rebellion; the union of England and Scotland, of Great Britain and Ireland; the capture and defence of Gibraltar, the siege of Fort St. David by Duplex; the battle of Plassey; the declaration of American Independence; the reformation of the Calendar.

4. By whom was Christianity introduced into this country? in what part of it, and why? What form did it assume? By what class of men was it disseminated? What material evidences of this work remain at the present time? Explain such words as *minster*, *minister*,

abbey church, the priory, Grey Friars and Black Eleanor Cross, cathedral, cloister.

5. Explain what is meant by Papal and lay Supremacy; by what sovereign was the former done in this kingdom, and on what grounds?

6. Explain briefly the main provisions of the large charters of English liberties; and mention the points which they were enacted.

7. What was the purport of the first Act of indentment, and what of the second?

8. What is meant by the expression, "The Bill Constitution?"

9. In what persons is the legislative and executive power vested in these kingdoms? in whom the administration of justice? and state what precautions have been adopted from time to time to secure its impartiality.

10. What are the special prerogatives of the estates of this realm?

11. Between what parties, with what results, at what time, were fought the battles of Hastings, Tewkesbury, Sluys, Mortimer's Cross, Bosworth, Pinkie, Naseby, Quiberon Bay, Nile, and Trafalgar?

12. Refer the following names, events, &c., to the proper periods in English history:—

(a.) Wicliffe, Chaucer, Sir Thomas More, Spenser, Lord Bacon, Ben Jonson, Dryden, Pope, Newton, Lessing, Addison, Hume, Gibbon, Dr. Johnson, Wordsworth.

(b.) Introduction of printing, poor laws, Sunday schools, steamboats, power loom, gas, railways, newspapers.

SPECIAL.

1. Divide the reign of Charles I. into three parts: 1625-1629, 1629-1640, 1640-1649; state briefly the events in the three divisions, and name the chief leaders on both sides.

2. What were the chief points in debate between Charles and his parliament in the first and second of the periods?

3. Draw a brief parallel between the life and principles of any two leaders of the parties which were opposed to one another.

(To be continued.)

TECHNICAL EDUCATION.

(Continued from page 614.)

14. From J. Scott Russell, Esq., F.R.S.

5, Westminster-chambers, S.W.
June 24, 1867.

SIR,—I have the honour to acknowledge the receipt of your letter of the 31st ult., enclosing copy of a letter addressed to the Chairman of the Schools Inquiry Commission by Dr. Lyon Playfair, and inquiring whether I agree with the substance of that letter.

In reply, I have to state that in much that Dr. Playfair has said I entirely agree, and that from my recent personal inquiries into the state of technical education in Switzerland, Germany, and France I have reluctantly come to the conclusion that it is much more advanced in those countries than in ours.

As a Juror in the Paris Exhibition I have come to the conclusion that the higher class of education gives to each of those countries to the workmen in its skilled trades, as well as the superior professional education given to the higher classes of men employed in technical professions, is everywhere visible in the works exhibited by those countries. And I attribute the surprising strides those countries have been making for the last ten years in many of the great staple branches of mechanical construction and manufacture to the admirable scientific and practical training which the governments of those countries provide for their working classes.

I enclose a memorandum, which at the request of some other jurors I prepared in Paris last month, as an expression both of my own opinion and that of many others with whom I have conversed on this subject. I may say

that we had felt it our duty in some way to call the attention of Government and the public to this matter, when Dr. Lyon Playfair's letter appeared in the *Times*.

So convinced was I of the importance of technical education to this country, that before the opening of the present Exhibition in Paris I took the opportunity of an invitation which had been given me to assist a meeting of the Society of Arts in the Technical Museum attached to the University of Edinburgh, to address the meeting on this subject, and I enclose also a newspaper report of that address.

I have, &c.,

J. SCOTT RUSSELL.

Henry J. Roby, Esq., M.A., &c., &c.

15. (*Enclosed in Mr. Scott Russell's Letter of the 24th June, 1867.*)

MEMORANDUM.

The fourth great International Exhibition has afforded an excellent opportunity for marking the relative progress of different countries in the arts, manufactures, and trades which contribute to the wealth and power of nations. We have especially noted the progress of other nations in those mechanical and constructive arts and trades in which, in 1851, England exhibited pre-eminent excellence. We have to record that in many of these some other nations appear to have made much more rapid progress than ourselves, so that we are *relatively* falling off. And we especially note that our falling off is not in unimportant departments, but in some of those which had formerly constituted our staple excellence.

We have to specify that those branches, in which other countries have now shown more rapid advancement, are some of our own great manufactures of steel and iron, steam machinery, locomotive engines, and tools and manufacturing machinery in general. We do not say that in all of these other nations have excelled us, in some they have not yet equalled us. But what we do feel, and therefore frankly state is, that their progress has, in the last 16 years since the first Exhibition of 1851, been remarkably greater than ours.

There are other branches of arts and manufactures in which possibly the reverse is the case. Glass and pottery, and the arts of design and construction of beautiful patterns both in form and colour, have made remarkable progress throughout England during the same period; we therefore confine our present remarks to the mechanical and constructive arts, not commonly called fine arts.

Dissatisfied with our national progress, we have naturally turned our minds to search for the cause of the progress of other nations and for the cure of our own deficiency. We find that during these years some nations have been occupied in diligently promoting the national education of the various classes of skilled mechanical workmen, for the purpose of giving skill to the unskilled and rendering the skilled more skilful. We find that some nations have gone so far as to have established in every considerable town technical schools for the purpose of teaching all the youths intended to be craftsmen those branches of science which relate most nearly to the principles of their future craft. Workers in metal are taught the nature of the mechanical powers with which they will have to work, and the chemical properties of the materials they will have to operate upon; engine builders are taught the principles of heat and steam, and the nature of the engines they have to make and work; shipbuilders are taught the laws of construction, hydraulics, and hydrostatics; and dyers and painters are taught the laws of chemistry and colour. All skilled youth are taught geometry, drawing, and calculation; and in many countries every youth who shows great talent in any department is promoted to a higher training school, and there educated at the public cost.

Besides these local schools, other countries have technical colleges of a very high class for the education of

masters and foremen in engineering, mechanics, merchandise, and other practical and technical professions.

We have not failed to notice that it is precisely those nations which have been systematically giving a course of preparatory training and education to their population in their skilled trades that have shown the most marked progress in national industry in these successive exhibitions.

Prussia, Switzerland, Belgium, France, America seem to make progress in proportion to their excellence of educational training:—Prussia in steel, iron, and general engineering work; Switzerland in scientific engineering, machinery, and watch and telegraph work, and in textile manufactures; Belgium in metal working and mechanical trades; France in metal work, and in steam engines, engineering structures, naval architecture, and steam navigation. All these nations seem to exhibit growing skill and progress in proportion to the excellence of the education and training they give to their manufacturing population.

It becomes therefore a serious national question for England and the English, whether they have or have not been wise in neglecting to take adequate measures of a national character for the complete technical training of all the youth destined to skilled trades and occupations. By this training we do not on the one hand mean elementary education, nor on the other hand do we mean any substitute for a practical working apprenticeship. We mean a schooling midway between the elementary day school and the workshop, which the youth should enter after he knows reading, writing, and counting, in order to learn to apply his reading, writing, and calculation to the purpose of acquiring such knowledge of mathematics, mechanics, mineralogy, chemistry, drawing, &c., as shall fit him more aptly and perfectly afterwards to learn and to profit by the teaching of the workshop and the office. It is unquestionable that apprentices to trades, coming into the workshops with this preparation, will make greatly more rapid and certain progress than those who enter direct from the elementary school.

But in England we can scarcely as yet be said to possess such schools. Certainly they are not uniformly distributed over the towns of England; and it seems that in no country have they thriven or even existed except when organized and sustained by nations at large, acting through their governments.

We have therefore to recommend to the serious attention of the British nation the consideration of the importance of establishing a national system of technical and trade education.

J. SCOTT RUSSELL.

Paris, May, 1867.

16. *From E. W. Cooke, Esq., R.A., F.R.S.*

The Ferns, Hyde-park-gate, South Kensington,
June 23, 1867.

MY LORD,—Having read with very great interest Dr. Lyon Playfair's admirable letter to your Lordship, I beg to state, though with considerable regret, that I am compelled to agree entirely with the opinions and conclusions expressed in that letter.

During a very careful and impartial examination of the varied productions of European countries in the International Exhibition at Paris, a multitude of instances met my eye which impressed me with the decided superiority of the industrial productions of the Continent over those of our own country. It must be distinctly understood, however, that I refer only to works of artistic taste—not to fine art—in matters connected with objects of useful and ornamental character belonging to the peaceful arts. With matters of war, whether military or naval, or the multitudinous inventions and triumphs in machinery, I have nothing to say, having no experience in those departments; nor have I any knowledge of the numerous economic manufactures, removed in a great measure from such as are the

result of fine taste and æsthetic feelings. In these latter objects it is that I feel the truth and justness of Dr. Playfair's broad and honest opinions. In very numerous instances I could not but observe the great advance made in the design as well as execution of works during the last ten years, in which I had sanguinely hoped we in England would have greatly excelled, if not triumphed, over our Continental neighbours. In this I am sorry to confess I have been disappointed, and am of opinion that it behoves the Executive Government and the chief municipal bodies of our country to lose not a moment in the consideration of this most important subject, in which the trade and commerce, the prosperity of our working men, and, I may say, our *national honour*, are so vitally and so deeply concerned and interested.

I cannot at present enter into details, but your Lordship will perceive that I entirely concur in every word of Dr. Playfair's letter.

I have, &c., E. W. COOKE, R.A., F.R.S.
To the Right Hon. Lord Taunton,
&c., &c.

17. *From Wm. Spotten, Esq.*

Belfast, June 29, 1867.

SIR,—In reply to your letter of 27th instant, I beg to state that I agree with the substance of the inclosed letter.*

I am &c.,
WM. SPOTTEN.

To H. J. Roby, Esq.,
&c., &c.

18. *From A. J. Mundella, Esq.*

Nottingham, June 29, 1867.

MY LORDS AND GENTLEMEN,—In reply to the inquiry addressed to me through your secretary, I have the honour to state that in the main I agree with Dr. Playfair's letter of the 15th ultimo, but I am of opinion that art and industrial education, without a thoroughly organized system of primary instruction, will not remove the danger which threatens our manufacturing and commercial supremacy.

I trust it will not be deemed presumptuous if I lay briefly before you the result of my observation on a subject in which I have long been interested.

The branch of industry with which I have been connected for thirty years past is the manufacture of hosiery. I am the managing partner of a firm employing five thousand (5,000) workpeople, with establishments in Nottingham, Derby, and Loughborough, employing more than four-fifths of the number, and with branches at Chemnitz and Pausa, in Saxony, employing about seven hundred persons.

In addition to the opportunities and experience which the superintendence of these establishments has afforded me, I have for many years past formed friendships with manufacturers in France and Germany. I have had free access to their warehouses and workshops, and I am as well acquainted with the progress of my own branch of industry in those countries as in England.

As the result of my observation I have for four or five years past been increasingly alarmed for our industrial supremacy; and my experience of the Paris Exhibition has only confirmed and strengthened my fears. In my own branch we still maintain the lead in the majority of articles, but the progress made by France and Germany since 1862 is truly astonishing, and it has been much greater than our own.

I am of opinion that Englishmen possess more energy, enterprise, and inventiveness than any other European nation. The best machines in my trade now at work in France and Germany are the inventions of Englishmen, and in most cases of uneducated workmen; but these machines of English invention are constructed and improved by men who have had the advantage of a superior industrial education. The largest hosiery ma-

chine-shop in France is that of Monsieur Talbot St. Just; models of all the best English machines have been purchased and imported, and are there assembled and constructed on thoroughly scientific principles under the superintendence of a young man who is well informed, took high honours at the school of the Government in Paris.

Precisely the same thing is taking place in Saxony, but the Saxons are, in respect of education, both mental and industrial, much in advance of the French, and in my branch they are our most formidable rivals.

In Nottingham, where the best machinery in the world is required and used in the production of hosiery, there is no such thing as industrial education. It is greatly as it is to be desired, I am acquainted with many good mechanics and superior workmen to whom it would be of no service, inasmuch as they cannot read nor write.

The contrast betwixt the workpeople of England and Saxony, engaged in the same industry, is most striking. I have had statistics taken of various villages and rooms in factories in this district, and the first ignorance they reveal is disheartening and appalling. I was born and educated amongst the working classes, and all my life have been in close association with them, but I never realised the condition of the masses of our workpeople till I took the pains to examine them personally in the manner I have indicated.

In Saxony, our manager, an Englishman of great intelligence, and greatly interested in education, and a residence of seven years has never yet met with a workman who cannot read or write. And not in a limited and imperfect manner in which the majority of English artisans are said to read and write, but with freedom and familiarity that enables them to enjoy writing and to conduct their correspondence in a correct and often superior style. Some of the sons of the poorest workmen in Saxony are receiving a technical education at the Polytechnic schools, such as the sons of our manufacturers cannot hope to obtain.

Whilst, therefore, I believe that the English workman is possessed of greater natural capacity than any of our foreign competitors, I am of opinion that he is gradually losing the race through the superior intelligence of the foreign governments are carefully developing in their artisans.

The influence of strikes and lock-outs has been undoubtedly against industrial progress. But the various practices of trades unions are the result of the general ignorance of the majority of workmen who are connected with them. I succeeded, nearly seven years ago, in forming a board of arbitration and conciliation for the hosiery trade of this district, and no strike has taken place since its formation. Leicester has recently followed our example, and during the past week the lace trade has been the same. This is the only solution, in my opinion, of that difficulty.

The education of Germany is the result of a national organization, which compels every parent to send his children to school, and after having laid the foundation of a sound education, affords to all those who have the capacity and inclination the opportunity of acquiring such technical knowledge as may be useful in the department of industry for which they are destined.

If we are to maintain our position in the industrial competition, we must oppose to this national organization one equally effective and complete. If we continue the fight with our present voluntary system, we shall be defeated. Generations hence we shall be struggling with ignorance, squalor, pauperism, and crime. With a system of national education made compulsory, and supplemented with art and industrial education, I believe within twenty years England would possess the most intelligent and inventive artisans in the world.

My Lords and Gentlemen,

Yours, &c.,

A. J. MUNDELLA

Her Majesty's Schools Inquiry Commissioners.

(* The enclosed letter was Dr. Lyon Playfair's.)

19. From James Young, Esq.

Chemical Works, Bathgate, July 4, 1867.

SIR,—I had the honour to receive your letter of 20th June, requesting me to give you my experience as to whether I agree in substance with Dr. Lyon Playfair's letter to Lord Taunton. I was a juror in the English Exhibition of 1862, but in the French Exhibition I am only an exhibitor; as such I have spent about a month in Paris studying the Exhibition, and there had the opportunity of meeting many jurors of different nations. I am bound to say that my experience accords with that of Dr. Lyon Playfair. So formidable did the rate of progress of other nations appear to many of us, that several meetings of jurors, exhibitors, and others took place at the Louvre Hotel on the subject. The universal impression at these meetings was that the rate of progress of foreign nations in the larger number of our staple industries was much better than our own. But it must be stated that a large number of our first-class machine and other manufacturers are not exhibitors in Paris, whereas other nations, I believe, have taken care to bring forward their very best; still, the great progress of other countries is evident. The reason for this increased rate of progress is the excellent system of technical education given to the masters of workshops, sub-managers, foremen, and even workmen.

England for a long time excelled all other countries in the finish of her machines; but now we find that foreign machine makers are rapidly approaching us in finish, and, having skilled and intelligent labour cheaper than ourselves, are progressing in all the elements of manufacturing.

Permit me to use my own case as an illustration. Originally I was a working man, but have succeeded in increasing the range of manufacturing industry. The foundation of my success consisted in my having been fortunately attached to the laboratory of the Andersonian University in Glasgow, when I learned chemistry under Graham, and natural philosophy and other subjects under the respective professors. This knowledge gave me the power of improving the chemical manufactures into which I afterwards passed as a servant, and ultimately led to my being the founder of a new branch of industry, and owner of the largest chemical manufacturing works of the kingdom. It would be most ungrateful of me if I did not recognise the importance of scientific and technical education in improving and advancing manufactures. Many men, without such education, have made inventions and improvements, but they have struggled against enormous difficulties, which only a powerful genius could overcome, and they have been sensible of the obstacles to their progress. Stephenson, who so greatly improved locomotives, had to be his own instructor, but he sent his son Robert to Edinburgh University, and the son did works at least as great as the father, and with far less difficulty to himself.

The improvement in locomotion has necessarily created great competition in the industries of the world, and unless we add skilled instruction to manual labour, England cannot expect to maintain her position in the industrial race. I have &c., JAMES YOUNG.

H. J. Boly, Esq., &c., &c.

THE PRUD'HOMMES SYSTEM.

HISTORICAL SKETCH.

The following is an historical sketch of the prud'homme system in France. The original idea of this institution dates back, in France, to a very early period. In those times the word prud'homme (*homo prudens*) was employed to designate judges, experts, and municipal officers. In the year 1296, in the reign of Philip le Bel, the Council of the City of Paris determined to appoint twenty-four prud'hommes, whose duty should be to accompany the chief of the merchants and the municipal councillors in their visits to the masters.

In 1414, the citizens of Lyons were authorised to nominate a prud'homme, to put an end to the disputes between the merchants and manufacturers attending the fairs. Later, an institution, called the "Tribunal Commun," was established at Lyons, and its duty was to settle amicably disputes between the silk manufacturers and their workmen.

After the abolition of trade guilds, in 1791, it was found necessary, in order to counteract the abuses which arose from an unrestricted liberty in trade and commerce, to lay down rules for the regulation of all matters arising between manufacturers and their workmen. With this object in view a law was passed in the year XI, which, after authorising the establishment of deliberative chambers of manufactures and trade, punishes with fine and imprisonment every combination, either on the part of masters for the purpose of lowering wages, or on the part of workmen to strike, or prevent others from working, or to stop work in any workshop. This law enacts that all police-court matters between workmen and apprentices and manufacturers shall be taken before the Prefect of Police in Paris, before the commissary-general in such towns as possess such an officer, and before the mayor or deputy-mayor in other places. This, however, not being satisfactory, in 1806 a further step was taken, and the Council of Prud'hommes was established. Whilst, however, the law only established this at Lyons, the Government by a decree formed Councils of Prud'hommes in other manufacturing towns. These arrangements remained in force until 1848. Complaints were made that workmen were not admitted to the Council of Prud'hommes, and that there was an unjust preponderance in favour of the manufacturers. In 1848, therefore, the Council of Prud'hommes was re-organised on an entirely new basis. The electors are declared to be manufacturers (patrons), masters of workshops (*chefs d'atelier*), foremen (*contre-maitres*), 21 years of age, and resident for six months within the district; whilst the same parties are eligible to serve on the council provided they are 25 years of age, have a knowledge of reading and writing, and have been domiciled for a year within the district. In 1853, a considerable modification was made in the arrangements. The Prud'hommes are not judges in the true acceptation of the term. They have special functions, of an exceptional character, of the same nature as those of Councilors of the Prefecture. Their powers are not executive, but simply administrative, and they are not exempt as judges from serving on juries. They hold their situations by election, except the president and vice-president, who are appointed by the Emperor. The Prud'hommes differ from civil or commercial judges, inasmuch as they have no executive power, and the same oath of office which they take before the prefect is not the oath of investiture which the members of Tribunals of Commerce take before the Imperial Court. There seems, however, to be some difference on this head, and the precise position which the prud'hommes hold as compared with judges proper seems not quite ascertained. In some of their proceedings they are treated as judges, whilst in others they are not. These, however, are nice points for discussion among French lawyers, but are not of any practical interest to the English reader.

HOW THE COUNCIL IS FORMED.

A Council of Prud'hommes is established on a resolution, passed by a Chamber of Commerce, or Deliberative Chamber of manufacturers, requesting the establishment of such a body. This request is communicated to the Prefect, who transmits it to the Minister of Agriculture and Commerce, with the following documents:—1. The vote of the Municipal Council undertaking to pay the expense; 2. A table showing all the industries amenable to the Council proposed to be established, such industries being placed under their proper divisions, the number of prud'hommes to be elected in each of them, and the

number of masters and workmen, whether electors or not, included in each division. A decree is then issued, in conformity with the regulations of Government, after the application has been passed, by the Council of State. This decree also fixes the number of which the Council is to consist, which must be six at least, exclusive of the president and vice-president, who, as has before been stated, are named by the Emperor.

The members forming the Council of Prud'hommes are elected by masters (patrons),* small masters (chefs d'atelier), foremen (contre-maitres), workmen connected with the trades comprised in the decree.

The qualifications for electors are as follows:—Masters ("patrons") must be of the age of 25 years, must have been licensed for five years at least, and for three years within the district of the Council. The smaller masters ("chefs-d'ateliers"), foremen ("contre-maitres") and workmen, must be of 25 years of age, and have exercised their craft for five years at least, and have been resident in the district for three years.

Persons eligible to serve on the Council must have the same qualifications as an elector, but in addition they must be 30 years of age, and able to read and write. Foreigners can neither elect nor be elected.

The list of electors is settled by the mayor of the district, and lodged with the prefect, who summons the electors to meet; the two classes of electors, masters and workmen, meeting separately, and separately electing representatives of their own class. There is an equal number of Prud'hommes in each class. In addition to public notices of the election, each elector has sent him a special notice. The mayor, or deputy-mayor, presides at these elections. The President and Vice-president hold their office for three years; and one-half of the Council retires every three years. Vacancies by death or legal incapacity are filled up by election, and the party elected to fill a vacancy holds office for the remainder of the period his predecessor would have done.

The préfet administers to each Prud'homme the oath of office, i.e., of obedience to the law, allegiance to the Emperor, and for faithful discharge of his duties.

The Council of Prud'hommes is divided into two chambers, one termed the private chamber (a chamber of arbitration or reconciliation), and the other the general or judicial chamber.

The Chamber of arbitration is composed of one prud'homme manufacturer and one prud'homme of the working class. This chamber must sit once a week at least for the settlement of disputes, and is presided over by the president or vice-president.

The General Chamber is composed of an equal number of master and workman prud'hommes, besides the president and vice-president, and this number must not be less than two of each class, whatever the number of the whole council may be.† The General Chamber must meet twice a month at least, to decide judicially on cases which have not been settled by arbitration. There is a paid secretary attached to each council.

THE DUTIES AND POWERS OF THE COUNCIL OF PRUD'HOMMES AS REGARDS BOTH CIVIL AND CRIMINAL PROCEEDINGS.

Firstly, what persons are amenable to them.

Secondly, what disputes come under the jurisdiction of the Council.

Councils of Prud'hommes are competent to decide in all cases of dispute between manufacturers, small masters, foremen, journeymen, and apprentices, whatever be the amount in dispute; but their jurisdiction

does not include other persons than these, and thus wholesale or retail dealers, not being manufacturers, do not come within the jurisdiction. Clerks or agents who sell the goods of a manufacturer, nor the proprietor who lets his manufactory, do not carry on the business either by himself or one on his behalf. As regards the workmen, a distinction is drawn between the workman in his own house, who works to order in his own house, and the workman necessary is that he should be under the orders or order of some manufacturer; but to this there are some exceptions by the courts of law. Those who furnish designs for the manufacture are brought before the Council of Prud'hommes, but not under the orders or control of the manufacturer.

The Council can only take cognizance of disputes relating to the trades in which the parties are engaged, the arrangements connected therewith. All disputes, as well as matters relating to trades not in the decree establishing the Council, are excluded.

Disputes relating to apprenticeship matters, of workmen, &c., are within the jurisdiction of the Council. The Council have power to settle disputes or restitutions which shall be made between parties, the cancelling of a contract, and to determine the indemnity to be paid by a master or workman who having decoyed an apprentice from his master. When, however, a third party, as is frequently the case in apprenticeship matters, is concerned, such as a parent or guardian, the Council has no power to act. An agreement between a master and his clerk, the clerk the business, is not an apprenticeship, and does not come under the jurisdiction of the Council.

As a general rule, the place where the dispute dwells determines the tribunal before which the complaint is brought; but, as regards the Council of Prud'hommes, it appears that this rule does not hold. The jurisdiction of the Council extends over all manufacturers and workmen engaged in the manufacture in the district covered by the decree establishing the Council, notwithstanding the parties may happen to be beyond the limits. By the special words of the decree establishing the Council of Prud'hommes at Dijon a regulation is laid down, and it may be taken as a rule, the situation of the factory, and not the domicile of the parties, determines the tribunal. The district over which the jurisdiction extends is laid down in the decree. In Lyons it is declared to be the three cantons into which the city is divided. By consent, however, of the parties, the Council may proceed in cases out of its jurisdiction. Councils of Prud'hommes have no jurisdiction in cases between two manufacturers; the object of the establishment is to settle disputes between them and their subordinates. The Councils cannot take cognizance of a question of warranty against a third party, neither master nor workman. Such a claim must be brought before the regular tribunals. In cases where the dispute is not within their jurisdiction affects public rights, the Council declines to proceed, but if it is purely of a private character the Council, in the absence of objection by the parties, goes on with the proceedings. The object of the Prud'hommes Councils is to reconcile the parties, and, in default of reconciliation, to pronounce judgment on the matters in dispute.

THE CHAMBER OF ARBITRATION OR RECONCILIATION.

The great object for which these Councils have been established is, by means of arbitration, to settle the differences which are daily taking place between manufacturers and workmen, and everything coming within the powers of the Councils is submitted to the arbitration. The Chamber of arbitration is specially established for this portion of the business, and is composed, as has been said before, of a prud'homme manufacturer and a prud'homme workman, with the president. The parties must appear in person on the day and at the place named in the letter sent by the secretary. The appen-

* "Patrons" are defined as those who manufacture their own materials; "chefs-d'ateliers" as those who, with or without the aid of journeymen and apprentices, carry on their work in their own homes, and make up the materials supplied by others, and according to patterns and directions given them. The editor is, however, informed by a Prud'homme that there is no distinction between the chef d'atelier and the contre-maitre, and that both are properly translated "foreman."

† The "Patrons" form one class, the "chefs d'atelier," "contre-maitres," and "ouvriers" form the other class.

the parties in person is absolutely imperative, case of sickness, and then a party may be represented by a relative merchant or manufacturer, duly authorized by letter. Parties may be assisted by counsel. A person requested to attend by the secretary does not need a citation, naming day and hour of attendance, but a short statement of the complaint, is placed in the hands of the bailiff to serve on the defendant. Parties are required to state their case carefully in plain and simple language, and if they offend in this particular after being called to order by the president, they are fined to an amount not exceeding 10 francs, and if such fine is affixed in some public place in the district. When the chamber of reconciliation fails to succeed in reconciling the parties, the case is sent on to the general chamber for legal judgment. Married women, under certain circumstances, are enabled to appear before the chamber, but, as these proceedings are on points of French law, which differs so entirely from English law, it is needless to enter upon them here. The award made by the chamber has not the force of a judgment, but is binding on the parties as a private contract, and has to be enforced as such contracts by the tribunals. Either party may put the other to a trial, and, this, if taken, is conclusive, but, if refused, the council, not acting as judges, have no power to do so, but simply insert the fact of refusal in their proceedings. The law declares that no action shall be brought before the courts unless there has been a pre-proceeding before the Council of Prud'hommes.

THE GENERAL CHAMBER, OR CHAMBER OF JUDGMENT.

The General Chamber takes cognizance of all cases in which the attempt at reconciliation has failed. Its jurisdiction is without appeal in all cases where the claim does not exceed 200 fr. (£8), but beyond that sum an appeal lies to the Tribunal of Commerce. The parties are brought before the chamber by citation, preceded by a report from the secretary. Minors and married women sue and are sued before this chamber (according to the special law of France relating to parties in these positions). The defence must be made in three days after notice served by the bailiff, and the defendant puts a statement in writing of the particulars of his defence, and sets down the case for hearing for the first day of the Council's sitting. The time for putting in the defence may be enlarged. In case of non-attendance judgment may be given by default. The appeal, if any, must be made within three months. Immediate execution may be obtained, and in cases of appeal the Council has in their discretion order provisional execution in the name of security for the payment of the amount, and this is a personal security if the parties be solvent. The Council being what is termed an exceptional court, has the power of executing its judgments, but it has the power of interpreting its decisions, a power which belongs to all tribunals without exception. The Council of Prud'hommes have power to pronounce judgment against the person in certain cases, thus in matters of commerce it has this power when the debt exceeds 500 fr., or when the damages and interest exceed 300 frs.

POWERS OF PRUD'HOMMES IN MATTERS OF POLICE.

The jurisdiction is confined in the same way as its civil jurisdiction. It deals only with matters occurring which disturb the order and discipline of the workshop; all other disturbances go before the ordinary police tribunals. Insubordination, bad language, blows, &c., come under the meaning of disturbing the order and discipline of the factory. In all cases under their jurisdiction the Prud'hommes appear to have the same powers as police magistrates, and their decisions are subject to the same right of appeal.

OTHER DUTIES OF PRUD'HOMMES.

They are invested with the duty of protecting property in design and trade-marks, settlement of accounts between manufacturers and managers or foremen; inspection

of workshops; the reporting infringements of the laws. The deposit of designs is made in the office of the secretary of the Council, and specially registered. In cases of dispute as to the right to a design, the Council issues a certificate stating which of the manufacturers has made the first deposit. The duties of the Prud'hommes go no further than this. The question is tried before the Tribunal of Commerce. Formerly the Council had jurisdiction in matters of trade marks, but this is no longer the case, such matters being now under the jurisdiction of the Tribunal of Commerce.

The Prud'hommes have jurisdiction in settling accounts between merchants and those entrusted with the making up of materials entrusted to them, and these accounts, when the balance is struck, are registered with the Prud'hommes, and a copy is delivered to the employer and the employed. When the balance-sheet shows a balance due from the employed to the merchant this balance is paid by means of monies kept back by the next employer, and this is compulsory on him, and he must retain in his hands for this purpose one-eighth part of the price of the work done. The new employer is liable to pay the accounts, up to 500 frs., when the employed has left the former employer without his consent or legal cause.*

The Prud'hommes, in deciding between masters and workmen, may take into consideration the custom of the trade when the agreements between the parties are silent.

The Prud'hommes are charged with the inspection of workshops; and this duty consists in collecting important statistics of the trade, numbers of workmen employed, &c., the improvements of which the manufacture is susceptible, its fallings off, the means of overcoming their shortcomings, in short, everything in which the public interest and industrial progress is concerned. The Prud'hommes are bound to give the manufacturers two days' previous notice of their coming, but they have no power to call for the books of the trade, nor for information as to new processes which it is required to keep secret.

The Prud'hommes are judges in matters of infraction of laws and rules of trade. Managers as well as workmen are not permitted to divulge trade secrets, and are punishable by the Prud'hommes if they do so. The same applies to breaches of trust and theft. The Prud'hommes draw up a *procès-verbal*, and this is acted upon at once by the other tribunals, who award punishments accordingly. Combinations among workmen come under their jurisdiction, but combinations, by the law of 1864, are now permitted so long as the means employed are not in themselves illegal. Whoever by violence, threats, or illegal means endeavours to create a strike, either among masters or men, with the view of raising or lowering wages, or interferes with the freedom of labour, is liable to an imprisonment of from six days to twelve months, and a fine of from 16 fr. to 3,000 fr. Prud'hommes neglecting their duties may be dismissed.

PARIS EXHIBITION.

The English and American departments, and, to a less extent, the German also, have been in a state of great excitement about a trial which has taken place to ascertain the relative value of two iron safes exhibited, one by Mr. Herring, of New York, the other by Mr. Chatwood, or rather the Chatwood Company, of Bolton-le-Moors. Mr. Herring challenged all the world to a trial of safes, and Mr. Chatwood accepted the challenge, the stake being £600 on each side, the balance of the loser's stake, after deducting costs of the trial, to be divided between certain charities of Paris, London, and Washington, to be named by the winner. A committee of five engineers was appointed to watch over the operations and pronounce upon the results. Two gentlemen, Robert Mallet, Esq., C.E., F.R.S., and Robert F. Fairlie, Esq.,

* The object of this law is to prevent masters from decoying men from their places.

C.E., both of London, were nominated by Mr. Chatwood, and J. E. Holmes, Esq., C.E., and J. R. Pickering, Esq., C.E., both of New York, by Mr. Herring; these four gentlemen then elected a French engineer, M. Paul Douliot, of the firm of Cail and Co., of Paris, as their president, and nominated Mr. W. J. Hasle, of the Whitworth Company, to act as secretary.

The conditions, as they appear in the printed copy of the terms of agreement, were, that each party might make use of gunpowder, picklocks, drills, taps, cold chisels, or any other tools or implements used by burglars, but the terms of this agreement were not maintained. Each party, by consent, employed three men to open the other's safe; Mr. Herring sent to New York for two noted locksmiths, and obtained the volunteer aid of the foreman of a German safe-maker; Mr. Chatwood selected two of his own men, and his number was completed by a Manchester man, also a volunteer. As soon as the terms of the trial were agreed upon the two safes were delivered into the charge of the committee, who examined them in order to see that no improper alteration or arrangement had been made in them since the challenge was given. They were then placed in the English testing-house for the trial. The next point was the production of the tools which each party was to use against his opponent's safe, and here the conditions of the agreement seem to have been entirely broken through. Mr. Chatwood's men carried theirs in a bag with a block-tin hammer (made use of by burglars) in a gun-case, so that they might have been carried into any house without creating the least suspicion; Mr. Herring's men appeared with two large cases of tools, which had to be brought to the testing-house on a truck, and included a sledge hammer, with a head weighing about 20 lbs.; immense steel wedges, weighing nearly, if not quite, as much; a powerful screw frame, such as is used to punch holes in rails and to straighten them, weighing about two cwt.; a drilling frame, large enough to embrace the safe; and lever and crowbars five feet long, if not more; in all a mass of engineers' tools weighing between four and five cwt. The committee rejected the screw frame and some other large wedges, but the sledge hammer, crows, and drilling frame were allowed.

The question as to the relative value of the safes was not put in a satisfactory manner, and the conditions of the two were totally different, so that the committee will certainly have some difficulty in arriving at a satisfactory conclusion.

Mr. Herring's safe was about five feet high, but contained within it a small box of immense strength fixed to the bottom of the safe near the back. Mr. Chatwood's safe is about three feet high, without any inner box; both have double skins, the hollow being filled in with fire-proof composition.

The portion of the trial which touches the security of property against burglars is the one which interests the world, and though circumstances already referred to make the task very difficult, we shall try to separate, as far as possible, one phase of the trial from the other. And here it may be mentioned that as regards the time occupied in the various operations, it was taken for the committee by Mr. Walker, of London, whose own safe was forced by burglars some months ago, and who, chronometer in hand, watched the proceedings with natural interest.

The work began on the 13th instant, at 2.44 p.m. In 29 minutes the doors of Mr. Herring's safe were forced by means of small wedges, and flung wide open, and the whole of the drawers and shelves thrown out upon the floor, leaving nothing inside but the small box at the bottom already alluded to. During this same time, and up to 3.45, that is to say for one hour one minute, Mr. Herring's men had tried picks, the drilling frame with ratchet brace, taps, wedges, and punches or drifts with the sledge hammer, on the lock and door of Mr. Chatwood's safe, and were then compelled to give the task up as hopeless; the peculiar form of the closing edges preventing the introduction of the wedges, the brittle

spiegleisen enclosed between the double walls of the safe breaking the drills, and coming off about the testing-house in the most haphazard manner, while the general strength of the safe even the drift and sledge hammer. Had not been used, the operations upon Mr. Chatwood's safe and except the noise made, were as if burglars might have effected; but the door was intact in spite of all, as did the small crime of Mr. Herring's.

Foiled in their attempts in front, the men began to operate on the side of Mr. Chatwood's safe with the immense steel wedges, over which sledge-hammers already alluded to, and, in addition, a large boiler-maker's set, that is a strong steel cutting punch, with handle, and sledge hammer, and they succeeded in making a hole when this work commenced Mr. Chatwood's sledge hammer also, which was of course not so daintily allowed, and his men set to work on the solid door of the inclosed box at 7.25. At 7.40 Chatwood's men had made a hole in the side of Herring's small box, and greatly to the surprise of the men were evidently fatigued; the light was gone, so the work was stopped for the night. The following morning the destruction of Herring's closed safe was completed in four minutes.

The recital of the latter portion of the experiment is only useful as exhibiting the admirable manner in which the men had to destroy. We have described the tools used; the men who used them were first-class workmen and foremen, some of them Herculean strength, and the noise was so great that the public, unaware of what was going on in the testing-house, were positively dismayed, and the police some difficulty in maintaining order without it. It is not surprise anyone when we state that the sledge hammers were brought down upon the heads of the wedges five, six, and seven times in succession, and then a halt, with a force and precision that astonished the engineers present. It should be added that the operations were watched by the members of the committee, some officers of the executive, a few of the English press, and Mr. Walker the time-keeper.

Fine Arts.

ARTISTS' EXHIBITION.—There exist at Fontainebleau, itself, and also in several villages in the forests of France, artists, of which Barbizon and Marlotte are the principal, and an inn in the former village has been famous for the sketches left by artists on the walls of the various chambers. A notice has just appeared to the effect that the artists have now established an exhibition of their own works in the same village, which is open gratuitously to the public from May till December.

Manufactures.

A LOOM FOR WEAVING CONVEX WORK has been invented in New York, and is now being shown at the Paris Exhibition. Besides answering the purpose of a hand-loom, hitherto exclusively used, it possesses an advantage—which is absolutely necessary where the work is scarce—of doing ten times the amount of work in the same space of time. With the hand-loom, one man can make at the utmost four pair of stays a day; whereas the convex weaving machine turns out 40 pair daily. It is, besides, more flexible than the hand-loom, and quite free from hard seams. This loom does the work automatically; the principle of a constant motion of travel for the shuttle was adopted for the sake of simplicity; but but as it is necessary, in weaving the gores, that the weft thread should pass through only a part of the breadth of the warp, the frequent

employed for the purpose of taking up the portion required to be woven in that part. As the passes over the full breadth of the warp, of which the portion, say one-third, is to be used, it unwinds length of weft thread from the bobbin, but only 1 of it is tied in the warp. In re-passing the one-third more is tied, thus leaving one-third of employed weft thread in the form of a loop upon the manufactured. To remove this superfluous the thread-catcher, which is a lever with an finger, passes from behind, through the lay on the de of the reed, and pulls the thread out. In consequence of this partial opening of the warp, the tie could not be used, and another contrivance be resorted to. This consists in a carrier, by which the shuttle is conveyed to the centre of the warp, it is taken by the other carrier and passed through the warp. By these carriers a very even motion, free from jerks, is imparted to the shuttle. The most important part of the work is performed by the regulator, which gives up motion, the action of which is to take up the cloth in such a manner as to leave a straight line of the reed. The material is woven first only on one side, then for the cases left for the whalebones, the material must be double, evenly over the breadth, then on the other side only; and, finally, the full breadth at the back and front of the stay, the action must change accordingly. To effect this, the passes between two sets of rollers, the upper of which are simple pressure rollers, to be regulated by screws and set-screws. The lower rollers are fluted, and worked by a system of levers independent of each other. The levers are worked conjointly by the jacquard, so that the lay gives only a movement to those which have been previously acted upon by the jacquard. A very elastic warp tension is obtained by a specially-constructed lever, combined with an elastic spring, so as to render the machine fit for any work, flat or creased, plain or ornamented, according to the cards used upon the jacquard and the material put in warp shuttle.

Notes.

HONOURS TO MEN OF SCIENCE, &c., IN FRANCE.—Amongst the decorations bestowed on the occasion of the serial fêtes, we find the following:—M. Barreswil, chemist, elevated to the rank of Officer of the Legion of Honour; and the following manufacturers created chevaliers of the same order:—MM. Bouillon, iron master; Brun-Faulqueir, stearine candle manufacturer; Bachelier; Gabriel Depaynin, director of coal mines; Rand, spinner, Flairac; Hayem, manufacturer, Paris; Besson, waterproof cloth maker, Paris; Joubert, sailcloth maker, Angers; Charles Leroy, manufacturer, Bouilly; Eugene Laniel, manufacturer, Vimontiers; Etienne Lemaire, manufacturer, Bolbec; Isidore Leroy, per hanging manufacturer, Paris; Méry-Samson, manufacturer, Lisioux; Testenoire, silk manufacturer, Lyons; Aubert, manufacturer, Elbeuf; Vivaux, iron master, Dammarie; Lévy, director of mines, Moselle; Oré, iron master, Mans; Durand, iron master, ordogne.

INDUSTRIAL PRIZES.—The Society of Industrial Sciences of Lyons offers silver and bronze medals for memoirs on the following subjects, for the year 1868:—*Mechanics*.—1. The most efficacious means of obtaining industrial furnaces, by a good disposition of all the parts, well arranged ventilation, economic combustion of fuel, and relative smoke-consuming power; 2. The means for controlling, measuring, and registering the motive power of machines, with the view of regulating the interests of proprietors and hirers of motive power. *Chemistry*.—1. Introduction of a new chemical industry with the department of the Rhone; 2. Creation of a chemical process or improvement of one already known.

Silk Trades.—1. Construction of an improved power loom for weaving plain silks; 2. Application of a known motor of not more than two horse power nominal, and presenting the greatest simplicity and economy of installation, regularity, and economy in working, and other qualities necessary for its introduction into the weaving shops of Lyons. *Natural Sciences*.—1. The best geological chart of one or more cantons of the Rhone; 2. Discovery, in the environs of Lyons, of a mineral substance applicable to the casting of metals, and especially of bronze, brass, &c.; 3. Explanation of the cause of the malady which attacks the silkworm, and means of prevention. *Commerce and Trade in General*.—1. Introduction, with success, of a new industry in Lyons; 2. Project for the foundation of a superior school of commerce at Lyons.

PUBLIC CHARITY IN PARIS.—The Direction of Public Charity has just taken a census of the poor population of Paris, which gives the following results:—In 1863 the total of the indigent population of Paris was given officially at 40,066 families, comprising 101,570 individuals; last year the total had increased to 40,644 families and 105,119 individuals, the proportion being one person inscribed on the lists of relief for every 17·12 inhabitants; this includes only those whose names appear in the lists of the bureaux de bienfaisance, and who are in receipt of official relief. The richest arrondissement, that of the Elysée, has but one indigent person out of 53·65; the poorest, that of the quarter of the Observatory, one in 9·25; and that of Menilmontant, one in 12·60. It is stated that three-fourths of the indigent poor are not Parisians, but provincials, attracted to the capital by the increase in wages, without taking into account the corresponding increase in rent and the cost of living. The whole sum distributed is excessively small, amounting on an average only to 48f. 65c. per annum for each family, or 18f. 65c. to each individual relieved.

AGRICULTURAL PRIZES IN FRANCE.—The Paris Society for the Encouragement of Arts and Manufactures has just announced a series of new prizes in favour of agriculture. (1.) A prize of 6,000 francs, to be awarded in 1873, for steam cultivation. (2.) A prize of 3,000 francs, for 1872, for the invention and propagation of the best methods of reducing the cost of hand-labour in the getting in of cereals. (3.) A prize of 3,000 francs, session 1874, for the cultivation of land on the slopes of mountains. (4.) Two prizes of 3,000 and 2,000 francs for systems of irrigation, to be awarded in 1874. (5.) A prize of 2,000 francs, to be awarded in 1870, for the best account of the various processes of wine making in use in the different parts of France, their discussion and comparison, and the improvements of which they are susceptible. (6.) A prize of 3,000 francs, to be awarded in 1869, for the best apparatus or process, in practical use, for the preservation of wine, with a view to exportation as well as the home trade. (7.) A prize of 1,000 francs, to be given in 1871, for the best study of the agriculture and rural economy of a province or department. The Society of Agriculture of Clermont in the Oise, distributes its prizes in September, for long service and good conduct of agricultural labourers; for the good construction and manufacture of agricultural implements, machines, and tools; and to the most able workmen in the management, care, and repair of agricultural implements, including steam engines. This prize has been established on the proposition of M. Albaret, who says: "It often happens that an agricultural machine is received from a distant part of the country (from abroad perhaps) which will not work, but which an intelligent artisan would set to rights in a short time, and at very small cost; such a prize would assist in stimulating rural workmen, blacksmiths, farriers, and others, to study such machines, and enable them to repair them when accidents happened, and thus save the neighbourhood considerable loss in time as well as money." The establishment of such a prize is equally honorable to the proposer and

the society which has adopted the proposition, and offers an excellent example for imitation.

FOOT BRIDGES OVER CROWDED STREETS.—It has long been proposed to throw foot bridges over the most crowded boulevards of Paris, and a plan for effecting this is now under the consideration of the authorities. The author of it proposes, by way of experiment, to erect a double foot bridge near the Boulevard Montmartre, where it is intersected by the Rue Montmartre and the Faubourg of the same name. The plan of the proposed bridge is nearly in the form of the letter X, that is to say, four flights of steps are to lead from the four corners of the footpaths to a central platform; each flight, however, is divided below into two branches, which being semi-circular, allow of a considerable elevation without overhanging the roadway. At the top of this compound staircase is a landing place, which is connected with the main platform by means of another short flight of steps. The proposed height of the platform above the road is about twenty-one feet. Executed in cast and wrought iron the estimate for this foot bridge is 50,000 francs (£2,000.)

PARLIAMENTARY REPORTS.

SESSIONAL PRINTED PAPERS.

Delivered on 13th August, 1867.

- Par. Numb.**

Messrs. J. M. Johnson and Sons have kindly placed at the disposal of the Council a number of their five-shilling English Catalogues of the Exhibition, sufficient to present each workman with a copy.

Subscriptions may be forwarded to the Financial Officer, at the Society's House.

The Council are now prepared to receive the names of any workmen recommended by their respective trades as fit and proper persons to undertake this important duty on behalf of their fellow workmen. A certain number have already been selected, and some of them are now in Paris.

PRIZES FOR ART-WORKMEN.*

The Council of the Society of Arts hereby offer Prizes for Art-Workmanship, according to the following conditions:—

I. The works to be executed will be the property of the producers, but will be retained for exhibition, in London and elsewhere, for such length of time as the Council may think desirable.

II. The exhibitors are required to state in each case the price at which their works may be sold, or, if sold previously to exhibition, at what price they would be willing to produce a copy.

III. The awards in each class will be made, and the sums specified in each class will be paid, provided the works be considered of sufficient merit to deserve the payment; and, further, in cases of extraordinary merit additional awards will be given, accompanied with the medal of the Society.

IV. Before the award of prizes is confirmed, the candidates must be prepared to execute some piece of work sufficient to satisfy the Council of their competency.

V. *Bona-fide* Art-workmen only can receive prizes.

VI. Although great care will be taken of articles sent for exhibition, the Council will not be responsible for any accident or damage of any kind occurring at any time.

VII. Prices may be attached to articles exhibited and sales made, and no charge will be made in respect of any such sales.

VIII. All the prizes are open to male and female competitors, and in addition, as regards Painting on Porcelain,

Cameo-cutting, Engraving on Glass, Decorative Painting, and Wall Mosaics, a second set of prizes, of the same amount, will be awarded among female competitors. If a female desire to compete in the female class only, she must declare her intention accordingly. The originals of the works prescribed may be seen at the South Kensington Museum.

IX. Any producer will be at liberty to exhibit, either in his own name or through his workmen, any work or works as specimens of good workmanship, in the various classes, provided that the work or works be accompanied with a statement of the name or names of the artisans who executed their respective portions; and if the work or works be sufficiently meritorious, extra prizes will be given to the artisans who have executed them.

X. Artizans may, if they think fit, exhibit works executed by them after other designs than those stated above, in any of the classes. Such works may contain the whole or portions of the prescribed designs, and must be of a similar style and character. Competitors must specify the class in which they exhibit. If the works be sufficiently meritorious extra prizes will be awarded.

XI. All articles for competition must be sent in to the Society's house on or before Saturday, the 21st of December, 1867, and must be delivered free of all charges. Each work sent in competition for a Prize must be marked with the Art-workman's name, or, if preferred, with a cypher, accompanied by a sealed envelope giving the name and address of the Art-workman. With the articles, a description for insertion in the catalogue should be sent. The works will be exhibited at the Society's House, and afterwards at the South Kensington Museum.

Castings may be seen at the Society of Arts, Adelphi, London, and the Schools of Art at Edinburgh, Dublin, Manchester, Glasgow, Birmingham, and Hanley in the Potteries.

Photographs and rough casts in metal, &c., may be purchased at the Society of Arts, John-street, Adelphi, at the prices named.

The plaster casts of the examples in classes 3 and 4 (except bas-relief 4a) may be obtained from Mr. Francis, 15, Myddelton-street, Clerkenwell, E.C.; the other casts from Mr. D. Brucciani, Galleria dello Arti, 40, Russell-street, Covent-garden, W.C.

* * The Council are happy to announce that several of the works which received first prizes in the competitions of 1863, 1864, 1865, 1866, and 1867, have been purchased by the Department of Science and Art, to be exhibited in the South Kensington Museum and the Art Schools in the United Kingdom.

FIRST DIVISION.

WORKS TO BE EXECUTED FROM PRESCRIBED DESIGNS.

For the successful rendering of the undermentioned designs in the various modes of workmanship according to the directions given in each case.

CLASS 1.—CARVING IN MARBLE, STONE, OR WOOD.

(a.) *The Human Figure*.—One prize of £15 for the best, and a second prize of £7 10s. for the next best, work executed in marble or stone, after part of a frieze of a chimney-piece, by *Donatello*, No. 5,795, in the South Kensington Museum; or a relieve in terra cotta, *Amorini* supporting an entablature; original in the South Kensington Museum, No. 11,940. Dimensions—Two-thirds the size of the cast (linear).—The design may be adhered to strictly or adapted to any architectural purpose.

[Cast—Fifteen Shillings; Photograph—One Shilling.]

(b.) *Ornament*.—One prize of £10 for the best, and a second prize of £5 for the next best work, executed in marble, stone, or wood after a carved chair-back in the South Kensington Museum. Dimensions—To be two-thirds of the cast (linear).

[Cast—Twelve Shillings. Photograph—One Shilling.]

* The Worshipful Company of Salters contribute £10 annually to this prize fund. The Worshipful Company of Clothworkers contribute £10 10s. to this prize fund. The Worshipful Company of Goldsmiths contribute £15 "for the encouragement of workmen in the precious metals." Particulars of the Goldsmiths' Company's prizes are given. The North London Exhibition prize consists of the interest of £167 7s. 3d., invested in the name of the Society of Arts, to be awarded by the Council "for the best specimens of skilled workmanship" at the Society's Exhibition of the works sent in for the prizes named above.

(c.) *Ornament*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed in stone, after a *Gothic bracket* in the Architectural Museum. Dimensions the same as the cast. In this design the details may be improved by the introduction of small animals, and the human head may be changed according to the taste of the art-workman.

[Cast—Ten Shillings; Photograph—One Shilling.]

(d.)—One prize of £20 for the best, and a second prize of £10 for the next best, work carved in wood after a panel in carved oak. Original in South Kensington Museum, No. 274. Dimensions—Optional.

[Photograph—Sixpence.]

(e.)—One prize of £15 for the best, and a second prize of £7 10s. for the next best, work carved in wood after the entablature of a chimney-piece carved in wood, in the South Kensington Museum, No. 85.'64. Dimensions—Same size as original.

[Photograph—One Shilling.]

(f.) *Ornament*.—One prize of £10 for the best, and a second prize of £5 for the next best, work carved in wood after an *Italian picture frame* in the possession of Henry Vaughan, Esq. Dimensions optional.—This design may be adhered to strictly or adapted in such manner as the workman may think fit.

[Photograph—Two Shillings.]

(g.) *Ornament carved and gilt*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed in wood, carved and gilt after a *Console Table* in the South Kensington Museum, No. 6,497, of the period of Louis XVI. The work to be carved roughly in wood, then to be prepared in the white by a gilder, then cut up or carved in the white by the carver, then to be gilt in mat and burnished gold. As such work may probably be executed by two persons, the prize will be apportioned, as the judges may determine.

[Photograph—One Shilling.]

CLASS 2.—REPOUSÉ WORK IN ANY METAL.

(a.) *The Human Figure as a bas-relief*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after the Martelli Bronze Mirror Case, No. 8,717, in the South Kensington Museum—dimensions, 6½ inches diameter; or a panel in low relief, the Virgin and Child, in South Kensington Museum, No. 66.'66. Dimensions—One-third of original.

[Cast of Mirror Case—Two Shillings; Photograph—One Shilling. Cast of Bas-relief, 3s. 6d.]

(b.) *Ornament*.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after a *tazza* in silver, date 1683, the property of Sir W. C. Trevelyan, Bart., now in the South Kensington Museum. Dimensions—The same as the model.

[Photograph—One Shilling.]

CLASS 3.—HAMMERED WORK, IN IRON, BRASS, OR COPPER.

Ornament.—One prize of £7 10s. for the best, and a second prize of £5 for the next best, work executed after a knocker in wrought iron, in the South Kensington Museum, No. 9,007.

If the work is executed in brass or copper, it should be rendered subject to the conditions of these metals, either as split and riveted or partly beaten from the sheet, and the awards will be made in view of these conditions. The work must not be covered with colour or any coating which masks the workmanship.

[Photograph—One Shilling and Threepence.]

CLASS 4.—CARVING IN IVORY.

(a.) *Human Figure in the round*.—One prize of £15 for the best, and a second prize of £10 for the next best, work executed after an ivory plaque of Silenus and Amorini, by *Fleming*, No. 1,059, in the South Kensington Museum; dimensions—five inches greatest length; or after a *relievo* in marble, the Virgin and Child, No. 4,233 in the South Kensington Museum. Dimensions—To be reduced in height by one-third (linear).

[Cast of the Plaque—Two Shillings; and Photograph of the Virgin and Child—One Shilling each.]

(b.) *Ornament*.—One prize of £7 10s. for the best, and a second prize of £5 for the next best, work executed after an ivory crozier head, in the South Kensington Museum, No. 214.'65. Dimensions—The same as the cast.

[Cast—One Shilling.]

CLASS 5.—CHASING IN BRONZE.

(a.) *The Human Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a panel in low relief, the Virgin and Child, in the South Kensington Museum, No. 66.'66.

A rough casting in bronze, on which the chasing must be executed, will be supplied by the Society at cost price.

[Plaster Cast—Three Shillings and Sixpence.]

(b.) *Ornament*.—One prize of £10 for the best, and a second prize of £7 10s. for the next best, work executed after a silver gilt missal cover, in the South Kensington Museum, No. 2,639.

[Photograph—One Shilling.]

CLASS 6.—ETCHING AND ENGRAVING ON METAL—NIELLO WORK.

Prizes of the Goldsmiths' Company.

Ornament.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after arabesques by Lucas Van Leyden, A.D. 1528. No. 18,968 in the South Kensington Museum. To be engraved the height of the photograph, and, if round a cup or goblet, repeated so as to be not less than nine inches in length when stretched out.

[Photograph—Sixpence.]

CLASS 7.—ENAMEL PAINTING ON COPPER OR GOLD.

(a.) *The Human Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a panel in low relief, the Virgin and Child, in the South Kensington Museum, No. 66.'66. Ground to be blue. Dimensions—Half size of original.

[Photograph—One Shilling; Cast, Three Shillings and Sixpence.]

(b.) *Ornament*.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after the back of a plate, No. 8,428, in the South Kensington Museum. Ground to be blue. Dimensions—The same as the Photograph.

[Photograph—Sixpence.]

CLASS 8.—PAINTING ON PORCELAIN.

(a.) *The Human Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a photograph of a drawing by *Raphael*, No. 20 in the South Kensington Museum. Dimensions—The same as the Photograph. This work is to be coloured according to the taste of the painter.

[Photograph—Ninepence.]

(b.) *Ornament*.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after a photograph of ornament by *Aldegrevier*, No. 2,118 in the South Kensington Museum, and coloured according to the taste of the painter, with a gold ground. Dimensions—Double the size of the Photograph (linear).

[Photograph—Sixpence.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 9.—DECORATIVE PAINTING.

(a.) *Ornament*.—One prize of £5, and a second prize of £3, for a work, executed after a photograph of ornament by *Aldegrevier*, in the South Kensington Museum, No. 2,118. Dimensions—length, 3 feet.

[Photograph—One Shilling.]

(b.) *Ornament*.—One prize of £5, and a second prize of £3, for a work, executed after a picture frame, in the South Kensington Museum, No. 7,890. Dimensions—5 feet by 8 feet 11½ inches, outside measure. The works to be executed on canvases, either with or without stretchers, in cool colours. Some lines of the mouldings may be gilt.

[Photograph—One Shilling and Sixpence.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 10.—INLAYS IN WOOD (MARQUETRY, OR BUHL), IVORY OR METAL.

Ornament.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after a guitar inlaid with ivory, ebony, and mother-o'-pearl. The ornament to be of the same dimensions as the original, but may be applied to any object. No. 9,611 in the South Kensington Museum.

[Photograph—Sixpence.]

CLASS 11.—CAMÉO CUTTING.

(a.) *Human Head*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a bust of *Clytie* in the British Museum—The head only.

[Cast of the Head—Five Shillings.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 12.—ENGRAVING ON GLASS.

Ornament.—One prize of £10 for the best, and a second prize of £3 for the next best, work executed after arabesques by Lucas Van Leyden, A.D. 1528. No. 18,968 in the South Kensington Museum. To be engraved the height of the engraving; and if round a glass or goblet, repeated so as not to be less than 9 inches long when stretched out.

[Photograph—Sixpence.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 13.—WALL MOSAICS.

Human Head.—One prize of £10 for the best, and a second prize of £7 10s. for the next best, work executed after a *Female Head* (over the lame cripple) in the cartoon of the "Beautiful Gate." The dimensions of the work should be regulated by the size of the tesserae proposed to be used, which size may be left to the choice of the artist. Although desirable, it is not necessary to execute the whole subject in actual mosaic. The original is at the South Kensington Museum. Tesserae of two sizes may be obtained from Messrs. Minton, Stoke-upon-Trent;

Messrs. Maw and Co., Broseley, Shropshire; Messrs. Fox and Sons, Temple-street, Whitefriars; and Messrs. J. A. Rust and Co., Carlisle-street, Lambeth.

[Photograph—One Shilling.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VII.

CLASS 14.—GEM ENGRAVING.

(a.) *Human Head*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a cameo portrait of *Savonarola*, No. 7,541 in the South Kensington Museum. Dimensions—The same as the cast.

[Cast—Sixpence.]

(b.) *Full-length Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a small Wedgwood medallion, No. 5,827 in the South Kensington Museum. Dimensions—The same as the cast.

[Cast—Sixpence.]

CLASS 15.—DIE SINKING.

Human Head.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a Wedgwood Medallion in the South Kensington Museum, No. 3,470. Dimensions—

[Photograph—Sixpence.]

CLASS 16.—GLASS BLOWING.

Ornament.—One prize of £7 10s. for the best, and a second prize of £5 for the next best, work executed after an original in the South Kensington Museum, No. 4,531. Dimensions—As given in the wood engraving.

[Photograph—Sixpence.]

CLASS 17.—BOOKBINDING.

(a.) *Bookbinding*.—One prize of £7 10s. for the best, and a second prize of £5 for the next best, work executed in bookbinding, after a specimen in the South Kensington Museum, No. 164,664. The work to be bound should be some classical author of the size given. Dimensions—The same as the photograph.

[Photograph—One Shilling.]

CLASS 18.—EMBROIDERY.

Ornament.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed, either after *Two Angels* in an example in the South Kensington Museum, No. 1194,664, or an Italian Silk in the South Kensington Museum, No. 7,468, which may be adapted to a screen. Dimensions—According to the taste of the embroiderer.

[Photograph—German, Sixpence; Italian, One Shilling.]

CLASS 19.—ILLUMINATIONS.

Ornament.—One prize of £5 for the best, and a second prize of £3 for the next best, copy made from an *Alcuin Card*, attributed to Giulio Olovio, in the South Kensington Museum, No. 2,958, or from a MS. border, dated 1460, No. 3,057, in the South Kensington Museum. Dimensions—One-half larger than the Photograph (linear).

[Photograph—Two Shillings.]

SECOND DIVISION.

CLASS 20.—WOOD CARVING.

(a.) *Human figure in the round, in alto or in bas relief. Animals or natural foliage may be used as accessories.* 1st prize of £25 and the Society's Silver Medal. 2nd prize of £15. 3rd prize of £10.

(b.) *Animal or still-life. Fruit, flowers, or natural foliage may be used as accessories.* 1st prize of £10. 2nd prize of £7 10s. 3rd prize of £5.

(c.) *Natural foliage, fruit, or flowers, or conventional ornament, in which grotesque figures or animals may form accessories, preference being given where the work is of an applied character for ordinary decorative purposes, as representing commercial value.* 1st prize of £10. 2nd prize of £7 10s. 3rd prize of £5.

(By order)

P. LE NEVE FOSTER, *Secretary.*

Proceedings of Institutions.

RYDS LITERARY INSTITUTE.—The report for the past year says the balance sheet for last year showed a balance in hand of £12 4s. 9d.; the amount received since that time is £90 6s. 2d.; the amount of payments is £94 8s. 11d. There is, therefore, a deficiency on the year's account of £4 2s. 8d.; thus the balance in hand of treasurer is reduced to £8 2s. The extra expenses of the year have been £15 16s. for catalogues, labels, and library shelves. Books to the value of about £8 have been purchased and added to the library during the past year. The names of 111 members are at present on the books. A new catalogue has been issued. The statement of accounts shows that the receipts have been £102 10s. 11d., and that there was a balance in hand of £8 2s.

SOUTH-EASTERN RAILWAY MECHANICS' INSTITUTION.—The thirty-ninth report, being for the half-year ending March 31, 1867, congratulates the members on the present prosperous condition of the Institution. The present number of members is 280, which is the same as at the corresponding period last year. Sixty-eight volumes have been added to the library, which now contains 1,568 volumes. New catalogues have been prepared. Classes for instruction in arithmetic, writing, and spelling, for juniors and adults, French, vocal music, mechanical and free-hand drawing have been carried on during the whole of the half-year; they have been attended by upwards of a hundred of the members, and the teachers report very favourably of the progress of the pupils. The members have had the opportunity of attending all lectures and readings in connection with the Ashford Institution free of charge during the winter months. The financial statement shows a balance in hand of £37.

WIGAN MECHANICS' INSTITUTION.—The thirteenth annual report states that the career of the Institution has not been marked by any particular feature. The subscription for painting and cleaning the Hall, including £50 granted by the Public Hall Association, amounted to £72 13s. The balance of the cost has been paid by the Institution. Several entertainments given at the commencement of the winter entailed a loss to the Institution of upwards of £15. The library has been weeded by the sale of 700 volumes, which were found of no use to the Institution. The vacancy has to a certain extent been filled up by the purchase of 61 volumes of new works, and by presents. The number of books now in the library is 2,451; 1,204 more volumes have been taken out during the past year than the year previous. The number of members is 303, slightly less than in the previous year. At the Government examination of Science Schools in 1866, several candidates obtained prizes. The income was £574; and there is a balance against the Institution of about £47.

EXAMINATION PAPERS, 1867.

The following are the Examination papers set in the various subjects at the Final Examination held in April last:—

(Continued from page 624.)

ENGLISH LITERATURE.

THREE HOURS ALLOWED FOR THE TWO AUTHORS
SELECTED BY THE CANDIDATE.

SHAKESPEARE.

("Hamlet."—"Henry V."—"The Tempest.")

1. In what connexion does each of the following passages occur? Explain every allusion and remarkable expression:—

- (a.) Since thou dost give me pains,
Let me remember thee what thou hast promised,
Which is not yet performed me.
- (b.) The slave, a member of the country's peace,
Enjoys it; but in gross brain little wots
What watch the king keeps to maintain the peace,
Whose hours the peasant best advantages.
- (c.) The single and peculiar life is bound,
With all the strength and armour of the mind,
To keep itself from 'noyance; but much more
That spirit, upon whose weal depend and rest
The lives of many.
- (d.) For in the book of Numbers is it writ,—
When the man dies, let the inheritance
Descend unto the daughter.
- (e.) We are such stuff
As dreams are made on, and our little life
Is rounded with a sleep—
- (f.) I once did hold it, as our statists do,
A baseness to write fair, and laboured much
How to forget that learning—but, sir, now
It did me yeoman's service.

2. Explain the following words and expressions:—
galliard, termagant, clepe, cerements, fiote, eyases,
espials, imposthume, "out-herod's Herod." "a babbled
of greenfields," "still vexed Bermoothes."

3. In what senses that have now become obsolete, were these words often used in Shakespeare's time:—*let, antic, crisp, sort, eclasy, marches.*

II.

4. Compare Ariel with Caliban.
5. Sketch the plot of the second act of Hamlet.
6. In what respects has Shakespeare deviated from history in Henry V.? From what source did he take his main facts?
7. Describe the character of Hamlet's mother.
8. What do you know regarding the texts of Hamlet and Henry V.?

MILTON.

("Paradise Lost," Books I. to VIII.)

1. In what connexion does each of the following passages occur? Explain the allusions and notice any remarkable expressions:—

- (a.) The easier conquest now
Remains thee, aided by this host of friends,
Back on thy foes more glorious to return,
Than scorned thou didst depart.
- (b.) Greater now in thy return
Than from the giant angels: thee that day
Thy thunders magnified; but to create
Is greater than created to destroy.
- (c.) In solitude
What happiness? Who can enjoy alone;
Or, all enjoying, what contentment find.
- (d.) As when by night the glass
Of Galileo, less assured, observes
Imagined lands and regions in the moon:
Or pilot, from amidst the Cyclades
Delos or Samos first appearing, kens
A cloudy spot.

- (c.) The mind is its own place, and in itself
Can make a heaven of hell, a hell of heaven.
What matter where, if I be still the same
And what I should be—
2. Give an account of the allegory of Sin and Death, and illustrate it from Scripture.

3. As when from mountain tops the dusky clouds
Ascending, while the north wind sleeps, o'erspread
Heaven's cheerful face; the lowering element
Scowls o'er the darkened landscape snow, or
shower, &c.

In what connexion does this passage occur? What reflection on the conduct of human creatures follows? How far do you agree with the poet's sentiment?

II.

4. Mention, and quote if you can, any passages in the *Paradise Lost* in which Milton alludes to the circumstances of his own life and times.
5. Sketch the argument of the Second Book of the *Paradise Lost*.
6. What do you know of the circumstances connected with the writing and first publication of the *Paradise Lost*?
7. Briefly compare the *Paradise Lost* with any other great poem with which you may be acquainted.
8. Give a list of Milton's principal works.

BUTLER.

(The Analogy, Part I.)

1. What is the nature of analogical evidence?
2. Give an outline of Butler's argument from analogy in favour of a future state.
3. "There is in the nature of things, a tendency in virtue and vice to produce the good and bad effects now mentioned in a greater degree than they do in fact produce them." Explain this statement.
4. What would be the result if a perfectly virtuous community of men existed on the earth? How does this supposition illustrate Butler's argument?
5. "Now the beginning of life, considered as an education for mature age in this present world, appears plainly, at first sight, analogous to this our trial for a future one." Sketch the line of reasoning in which these words occur.
6. In what connexion are the words *moral* and *positive* opposed to each other?
7. Explain the terms *necessity* and *final cause*.

II.

8. Give a short analysis of the first part of the Analogy.
9. What do you know of the principal works the tendency of which the Analogy was intended to counteract?
10. Sketch the life of Butler.

SHAW.

(History of English Literature, Chaps. I., II., IV., V., to IX., XV., XX., XXII.)

1. Give an account of the way in which the Latin element of the English language has been brought in.
2. Sketch a life of Chaucer and give a list of his principal works.
3. What do you know of Southwell, Fairfax, Sir Philip Sydney, Lord Buckhurst.
4. Give some account of the Faery Queen.
5. What was the effect of the philosophical works of Lord Bacon upon the study of natural science?
6. In what way was the drama first developed in England?
7. Give a classified list of Shakspeare's plays.
8. Which are called "The Augustan Poets?" Why are they so called?
9. What do you know of the principal essayists of Queen Anne's time?
10. Sketch the life of your favourite modern poet, and name his chief poems.

LOGIC AND MENTAL SCIENCE

THREE HOURS ALLOWED.

MORAL PHILOSOPHY.

Smith's Theory of Moral Sentiments.

1. How do we judge of the propriety or the impropriety of the sentiments manifested by our fellow-men?
2. Analyse the sentiments of *amiability* and *respectability*.
3. Why is it a breach of propriety strongly to express our animal passions, and no breach of it to express social passions to any degree we choose?
4. What is the origin of ambition?
5. On what ground does Adam Smith teach us that regard an action as being worthy of reward or punishment?
6. Analyse the sense of merit and demerit.
7. Explain the principle of *self-approbation* by the law of sympathy.
8. How do you distinguish between the desire of praise and praise-worthiness, and between the hatred of blame and blame-worthiness?
9. How does Adam Smith evolve the sense of duty out of the law of sympathy?
10. How are the general rules of morality formed, and what is their especial value and authority?

LOGIC OF INDUCTION.

Mill's Logic.

1. Explain the difference between reasoning *inductively* and reasoning *deductively*.
2. In investigating any branch of physical science, facts of the case have to be carefully collected. Distinguish between such a collection of facts and induction, properly so called.
3. Whately says that all inductions are syllogisms with the major premiss suppressed. Is this true? If so, what is the major premiss when supplied, and on what does it rest?
4. Distinguish between *laws of nature* and particular instances of them. Give examples of both.
5. How does Mill state the law of causation, and what evidence does he consider it to rest?
6. What is meant by the composition of causes? Does it always follow the analogy of the composition of forces?
7. State and explain Mill's four methods of experimental inquiry.
8. What is an hypothesis? When is it legitimate, and what is its proper use?
9. What is Mill's explanation of the word *chance*? Is there any ground for a calculation of chances? What is it?

FORMAL LOGIC.

1. Which of our intellectual powers are independent of any aid from language, and which of them can only be properly developed by the co-operation of language? Give reasons for your conclusions on this point.
2. What is the difference between abstraction and generalisation? What names do you give to the results of these faculties—first, when only conceived in the mind; secondly, when stated in words?
3. Can logic tell us whether any single proposition is true or false? If so, why? If not, why not?
4. What is meant by the extension and comprehension of a term? How are extension and comprehension related to each other?
5. Explain the doctrine of the *predicables*, and give a complete classification of all possible predicates.
6. Give the rules for a correct logical division and definition. How are these rules often violated in common life?
7. What is meant by the *quality* and what by the *quantity* of a proposition? What simplifications have been proposed in formal logic, through properly marking the quantity of the predicate?
8. There are six general rules of the syllogism. State and justify them.
9. What is an enthymeme? Put the following examples into a complete syllogism, stating the mood and figure:—

a. Ireland is distressed, therefore it is misgoverned.

b. The Epicureans should be considered true philosophers, because they did not consider virtue to be essentially good.

10. What is an epicheirema? Expand the following into two or more separate syllogisms:—Every thing, the knowledge of which is obtained by intuition, is true, because upon such intuitions all reasoning and all knowledge are based. But our mental identity is a fact, which we know by intuition, since the belief of it is immediate, irresistible, universal; it, therefore, must be grounded in truth.

11. How may fallacies be classified? What names would you give to the following?

a. No evil should be allowed that good may come; but all punishment is an evil, so that no punishment should be allowed that good may come.

b. Leaving off animal food has greatly improved his health, for he has never experienced a headache since.

MENTAL PHILOSOPHY.

Sir W. Hamilton's Lectures.

1. What general classification of mental phenomena was adopted by Hamilton, and how did he *sub-divide* the intellectual powers? Show the precise function of each of the faculties enumerated under the latter.

2. Hamilton speaks of our knowledge in *perception* being regarded by some writers as immediate, by others as immediate. To what theories of perception does he refer, and what different forms have these theories assumed?

3. What is meant by natural realism, and what by cosmthetic idealism? On what grounds has the former been denied?

4. Prove by facts that sensation and perception are in the inverse ratio to each other.

5. Is visual distance a simple perception? What is Berkeley's theory on this point, and on what grounds did he maintain it?

6. What does Hamilton mean by "latent thought?" Give the facts of the case, and what they are intended to account for?

7. What difference does Hamilton draw between the *retention* and the *reproduction* of our ideas? State the laws of reproduction.

8. Give a brief account of Hamilton's views respecting the nature and province of imagination.

(To be continued.)

PARIS EXHIBITION.

The committee entrusted with the task of watching the proceedings, and deciding on the relative merits of the English and American safes, have resigned their functions. If this act had merely resulted from the inherent difficulties of the case, and from the departure from the terms of the original agreement, no one who watched the proceedings, or has carefully read the report, should be surprised; but when it has arisen from a different cause, and one which we feel a delicacy in touching upon, and we shall only say, therefore, that, in consequence of an improper proceeding of one of the parties interested, the president of the committee resigned his office, and the other members immediately refused to proceed further. As regards the English public, and especially those who are interested in the safe custody of valuables, the trial has clearly shown that Mr. Chatwood's safe is proof against any of the means at the disposal of burglars.

Few objects in the Exhibition have wider or a deeper interest than the specimens of cheap houses, or apartments for working men and their families; some remarks on what is being done under this head in Paris appeared in the notes of the "Society's Visit to Paris," in last week's *Journal*, and a few particulars respecting the efforts of the Mulhouse and other societies will help to

complete the case. The Mulhouse Société des Cités Ouvrières was formed in 1853, with a capital of 300,000 francs, since increased to 355,000 (£14,200), its object being to put workmen in possession of houses of their own, by payment running over a certain number of years. The whole of the shares, each of the value of 5,000 francs, are held by twenty-one persons. At the outset of the society, the Duc de Persigny, then Minister of the Interior, obtained from the Government a grant of 300,000 francs, to be employed by the Company in creating establishments of public utility, and it was employed in building a large restaurant, a bakery, baths and washhouses, an asylum, broad streets bordered with trees, fountains, sewers, &c., and the Company undertook, on receipt of this subvention, to abandon its profits, to sell its houses and grounds at cost price, only to pay its shareholders 4 per cent. per annum, and to expend at least £36,000 in building houses. The first houses were erected in the year 1854, and the total number constructed to the end last year was 800. For some time all the houses have been built in groups of four, after two plans, that is to say, on one or two floors, each having a cellar and loft of the whole size of the house, and a private garden. The houses on two stories contain a large room on the ground floor, which may, if necessary, be divided in two, a kitchen and two rooms upstairs; those on one floor have two rooms, and a chamber if required in the loft. The ground covered by each house and garden averages about 200 square yards, and is enclosed by wooden palings. The rise in the price of materials has lately caused an increase in the cost of the houses—those on one floor costing at present £106, and those with an upper floor £132 to £136. The workmen who purchase the houses are allowed fifteen years to pay for them, but they have to pay down a sum varying from £8 to £12, according to the value, and to pay, moreover, 5 per cent. on the outlay. The payments are required to be made monthly, at the rate of 16s. to 20s. per month, and this only exceeds the ordinary rent of inferior houses in the same locality by five shillings to six shillings per month. The number of houses sold varies extremely—in 1856 the number was only five; in 1857 it was 110; and since that period it has ranged from 19 to 100; the sales this year have already amounted to 55, or more than the average. The payments are made with great regularity, and are often pre-dated to save the interest on the capital. An equitable arrangement is made when the purchaser cannot complete his bargain, and no instance of forfeiture has occurred; and of 645 houses sold previous to 30th June, 1866, 200 have been completely paid for. The total sum received by the Company, without counting the 5 per cent. interest, is more than £50,500. These results are highly satisfactory, and the Company continues to build from 50 to 60 new houses annually.

It is an interesting fact that more than twenty of the houses sold have been purchased for their parents by young soldiers out of the bounty paid to voluntary recruits; it is equally satisfactory to know that the possession of a comfortable house weans the Mulhouse *ouvriers* from the wine shop.

The restaurant and the bakery sell their productions at cost price, so that the bread is considerably cheaper there than elsewhere. A meal of soup, meat and vegetables costs 35 centimes (3½d.). Clothing, groceries, and other necessaries are also sold as cheaply as possible, but always for cash. The charges at the baths and washhouses are, for a comfortable bath, with towels, 15 centimes, and for two hours washing, and the use of the hot-air stove, 5 centimes, or one halfpenny. The asylum is capable of receiving 250 to 300 children between the ages of three and six years, and there are two large primary schools near the *Cités ouvrières*.

One large house is composed of furnished apartments for bachelors, who have each a nicely-furnished room for 5s. 6d. per month.

One condition is insisted on by the Company, namely,

that every one who buys or hires a house in the *cité* shall send his children to school; and annual prizes are awarded to those who distinguish themselves in the education of children, in the care of their houses and gardens, and in general order and economy. A large free library is established in the *cité*, and the number of books taken out last year exceeded 70,000. The population amounts to 5,500 souls.

The total outlay of the Company for ground and buildings to the present time is stated to amount to 2,400,000 francs (£96,000), and the payments of the purchasers now greatly exceeded the amount of the loans contracted by the Company, which amount to about £40,000.

One source of profit to the Company is the sale of plots of ground amidst the *cités ouvrières* for the establishment of spinning and weaving mills, the tract of land purchased by the Company being large and formerly of small value. These particulars are derived from an official report signed by M. Jean Dollfus and three other administrators of the *cités ouvrières*, as well as by M. Emile Muller, their architect.

The next most important experiment of the same kind has been made by the Company of the collieries of Blanzay, in the department of the Seine and Loire, which employs 3,500 men, and has built 679 houses, on a plan closely resembling that of the Mulhouse Company; it has also let or sold plots of ground for 99 other houses, erected by the men themselves. Each habitation consists of three rooms, and has a garden attached. The cost of each house, land included, is given at 2,200 francs (£88), and the rent is 54 francs a year, or about three-halfpence a day.

In the model house erected in the grounds of the Exhibition will be found a fine collection of the minerals of Blanzay, and other interesting matters.

The old water-works of Marly, those created by order of Louis XIV., to supply the palace and fountains of Versailles, were once almost numbered amongst the wonders of the world, but no vestige of these has been in existence for many years; models of them, however, are preserved in the *Conservatoire des Arts et Metiers* of Paris. The machinery was reconstructed between the years 1811 and 1826; but that now in operation was only decided on in 1854, and is not yet quite finished.

The old machine was the work of the Baron de Ville, engineer, and a clever carpenter of Liege, named Pennequin, and consisted of fourteen large wheels with vertical pumps, which lifted the water from the river to a first reservoir, sixty other pumps then raised the water from the first to a second reservoir, and a third set of pumps raised it again to the top of a tower erected at the head of the great aqueduct. The number of pumps was two hundred, and the connecting apparatus was of the most complicated and primitive description, making far more noise than work, so much so that with water power estimated at from 1,000 to 1,200 horse power, the machinery never raised more than 6,000 tons in the 24 hours, and lastly fell off to 2,000 tons.

The new machine has six water wheels, and when completed—only five are yet in work—is calculated to lift 15,000 to 16,000 in the 24 hours at an elevation of more than five hundred, spread over a distance of about 7,500 feet. The machinery consists of vertical water-wheels, each of which has four horizontal pumps, worked by cranks on the axis of the wheels. Each of the wheels is 40 feet in diameter, and nearly 15 feet in width. A nicely executed model and series of plans and sections, together with full details of the new machinery and its capabilities, will be found in a small building in the park, not far from the model houses above referred to.

The comparative dryness of the soil of Paris, and the very small quantity of vegetable mould which lies on the stony strata, makes it very difficult to keep grass in good condition, and recourse is had to several ingenious methods of watering; the most simple being the use of pipes, attached to a hydrant, and pieced with a few rough holes in their sides; the pressure

being considerable, the water is forced through the jagged holes in the form of fine spray, or, as is curiously enough called here, in powder. A modification of his method has recently attracted considerable attention in the exhibition grounds; the nozzle of the pipe is held up by a small frame, and attached by a joint is a small curved piece of pipe which revolves by the force of the water as it issues from the pipe; the consequence is that the water is cast over the grass in the finest form possible; the effect of the rays of the sun upon this artificial mist is curious. Another and highly important application of this extreme subdivision of water is now under experiment here, namely, the construction of a steam engine without any boiler, the steam being produced instantaneously in the furnace. We have not yet seen this machine, which is the invention of M. Paul Lyons, assisted by M. Savial du Fay, engineer of the Imperial navy, and which was examined the other day by the Emperor in one of the courts of the *Musée de la Couronne*, Quay d'Orsay.

Manufactures.

A NEW ACT ON EQUITABLE COUNCILS.—The Act to establish equitable councils of conciliation to settle differences between masters and workmen has just been printed. After reciting the 5th of George IV. and the other Acts to amend the same, it declares that in order the better to facilitate the settlement of differences between masters and workmen, it is expedient, without repealing the several Acts, that masters and workmen should be enabled, when licensed by her Majesty, to form equitable councils of conciliation or arbitration, and that the powers of the Acts for enforcing awards made under or by virtue of the provisions should be extended to the enforcing the awards to be made by such councils under the authority of such equitable councils of conciliation. The mode of procedure is for a number of masters and workmen in a locality to call a meeting and agree to form a council of conciliation and arbitration, and to petition her Majesty or the Secretary of State to grant a licence, which may be done after publication in the newspapers. A council is not to consist of more than two nor more than ten masters and workmen, and a chairman, and the petitioners for a licence must proceed to the appointment of a council from amongst themselves within thirty days after such grant of licence, and the council is to remain in office until the appointment of a new council in its stead. The council is empowered to determine questions submitted to it, and to enforce its awards, as mentioned in the first recited Act, by an application to a magistrate, by distress, or by imprisonment. No council under the Act is to award a rate of wages or price of labour or workmanship which the workmen shall in future be paid. A council of conciliation is to be appointed by a council of counsel, solicitors, or attorneys to be allowed to sit on any hearing before the council or committee of conciliation unless consented to by both parties. The employers and part occupiers may demand to be registered and to have a vote for the council, and may be admitted thereto. A registry is to be kept, and the masters and workmen are to elect the council. The forms to be used in carrying out the Act, and to enforce the awards of the councils on the questions "submitted to them by the parties," appear in the Act.

Commerce.

COTTON IN SOUTH CAROLINA.—Mr. H. P. Wake, Her Majesty's Consul at Charleston, in a report addressed to Lord Stanley, remarks on the probable results of the operations of the agriculturalists of South

Carolina during the present year. On a former occasion (he says) I ventured to predict that the exports of cotton from Charleston for the year to end on the 31st of August would not exceed 150,000 bales. The business of the season may now be considered as closed; very little more is likely to come during the three remaining months of the year, and the quantity is exactly in accordance with my preconceived views. At the present moment the inhabitants are exerting themselves to the utmost of their ability to produce another crop. They are, however, suffering most grievously from famine; it has driven very many of their number away; many negroes have been induced to go to Florida, some to Africa, and many others to South Western States. On the other hand, there has been no influx to take the place of the emigrants. The effect of the famine has also become apparent in the impaired strength of the animal power usually kept and used by the agriculturists in their proper pursuits. I have made particular inquiry of the progress of the farmer in the interior, and I am sorry to be again compelled to draw unfavourable conclusions. In short, I am obliged to predict that his present operations will not promote the prosperity of former years. To place this port in its former position, it is necessary to supply it with 550,000 bales of cotton for export. The current year has given it 150,000, and the agriculturists of the interior must be asked for the remaining 400,000. The response will be, the war has ruined us. Our negroes have gone away; want of means precludes us from offering to others sufficient inducements to contract with us, and we have not the necessary mules and horses to carry the ploughs we would desire to run. And then, again, they will say, our crop last year perished during the summer drought, and having no food for ourselves, we cannot possibly provide for retainers. But the same system which caused the present terrible famine is still persevered in, and must necessarily sooner or later drive from the land much of its labour power. The negro being a free man, the planter leaves him to provide for himself, and thinks only of the cotton which his labour is to produce, and the returns to be obtained for it. In former times the master was more keenly alive to the responsibility that was on him to provide food for his slaves; now, having no slaves, that responsibility is removed; he plants cereals only for his own immediate use; he plants cotton for such returns as will pay the expenses of the farm, and furnish the planter with such income as his sense of comfort requires. But the inevitable result of this system is a recurring famine and a still further depleting of the population. For when the want of corn is general, to supply it to every household throughout an extensive area is quite impossible. The number of plantations in the State, I have no doubt, is very much greater than during the last year; but the aggregate of negroes employed, I am equally sure, is very much less. Yet I am not disposed to think that the production of the State will be less; for allowance ought to be made for the industry and zeal of the cotton planter; and I believe that the heavy supplies of guano, that by some means or other the planters have managed to secure, will occasion a production sufficient in this year to counterbalance the loss to be sustained by the diminution of labour. I conclude, therefore, that the section of country which is tributary to this port will, for the ensuing year, furnish to her for export a quantity of cotton corresponding very closely with the amount furnished during the current year; but that the plan of operations is erroneous, and must tend to the gradual diminution of the labour of the country, and to the consequent cessation to the same extent of agricultural operations. But, in addition to this great impediment to the prosperity of the agriculturist, it should be borne in mind that the high prices which must be paid for every article of use or consumption are more than corresponding with the increased rate he obtains for his agricultural products. These

high prices are occasioned by an inflated currency and by the imposition of taxes, so general in their application as to reach almost every conceivable thing. But even this is not all, for a still further tax of two cents and a half per pound must be paid on all the cotton of the ensuing season. In short, the planter meets with so much discouragement, that the wonder is he possesses the courage to persevere in so hazardous an enterprise as that to which his talents, capital, and life are directed.

BRITISH INDIA.—A blue-book of 72 pages has just been issued, which may probably be regarded as the first of an annual series—a *Statistical Abstract* relating to British India. It describes British India as having an area of 955,288 square miles, and a population estimated at 144,874,815; native States an area of 596,790 square miles, and a population of 17,909,199; States under French Government 188 square miles, and 203,887 inhabitants; States under the Portuguese Government 1,066 square miles, and 313,216 inhabitants—making a grand total of 1,553,282 square miles, with a population of 193,100,963. The population of Calcutta, according to the census of January, 1866, was 377,924; of the town of Bombay, according to the census of February, 1864, 816,562; of the town of Madras, according to the administrative report for 1863, 427,771. The commercial progress of British India of late years has been astonishing. In the financial year 1840-41 the merchandise imported by sea from foreign countries was of the value of £8,415,940; in 1860-61 it had risen to £23,493,716; in 1864-65 it was £28,150,923; in addition to £21,363,352 of treasure. In the year 1848-49 cotton goods of the value of £2,222,089 were imported into British India; in the year 1864-65 of the value of £11,035,885. The exports of merchandise from British India increased from £13,455,584 in the year 1840-41 to £32,970,605 in 1860-61, and to £68,027,016 in 1864-65. This last increase was, of course, due chiefly to the effect of the American civil war; in the year 1859-60 the export of raw cotton from British India amounted in value to £5,637,624, in 1864-65 to £37,573,637. The other chief exports in 1864-65 were:—Opium, £9,911,804; rice, £5,573,537; seeds, £1,912,433; indigo, £1,860,141; jute, £1,307,844. The United Kingdom took £7,054,388 worth of the exports in 1840-41, and £46,873,208 in 1864-65. Exports of the value of £10,874,652 in the last year went to China and Japan, and £2,902,596 to France. The entrances and clearances of British vessels in that year at ports of British India amounted together to 10,911 vessels, of 5,417,621 tons; of European and other foreign vessels 1,755, of 920,532 tons; of native craft, 40,277, of 1,582,864 tons. In the year 1864-65, 2,747 miles of railway were opened in India, and conveyed 12,826,518 passengers. There were 1,421 post-offices, and 55,986,646 covers were transmitted through the post, besides books and parcels. 17,117 schools and colleges were maintained or aided by the Government; the average attendance of pupils in them was 435,898, and the Government expenditure upon them £391,277. £4,473,263 was expended in the year upon public works. 11,736 miles of government telegraph lines were open. The gross public revenue of British India increased from £20,124,038 in the financial year 1839-40, to £45,652,897 in 1864-65; and the expenditure from £22,228,011 in the former year to £46,450,990 in the latter. The public debt advanced from £34,484,997 in 1839-40, to £98,477,555 in 1864-65. The troops employed in British India in the former year were 34,604 Europeans and 199,839 natives; in 1864-65, 71,880 Europeans and 118,315 natives.

Colonies.

EXPORT OF GOLD FROM VICTORIA.—The total amount of gold exported from the colony since the beginning of the year is 681,410 ozs., of which 76,726 ozs. were

from New Zealand. During the corresponding period of last year the quantity exported was 666,871 ozs., of which 121,393 ozs. were from New Zealand.

REVENUE OF NEW SOUTH WALES.—The Customs' revenue at this port continues to decrease, and, with the exception of November last, the receipts for last month were smaller than for any similar period since the commencement of 1866. The receipts for the month ending 31st ultimo were as follows:—Brandy, £8,710 4s. 4d.; gin, £4,100 17s. 4d.; liqueurs, cordials, or strong waters, £70 14s. 3d.; whisky, £1,028 13s. 7d.; rum, £10,553 10s. 1d.; perfumed spirits, £102 14s. 10d.; all other spirits, £545 7s. 10d.; wine, £1,854 14s. 10d.; ale, porter, and beer, in wood, £1,139 3s.; ditto, in bottle, £625 4s.; tobacco and snuff, £4,343 11s.; ditto, unmanufactured, £979 18s.; cigars, £503 3s. 11d.; tea, £4,332 16s. 8d.; coffee and chicory, £589 1s. 10d.; sugar, refined, £99 16s. 4d.; unrefined, £5,385 14s. 6d.; dried fruits, £499 7s. 8d.; hops, £28 14s. 6d.; malt, £38; rice, £1,181 8s. 11d.; gold, £18 14s. 2d.; opium, £819 16s. 3d.; bonding warehouse duty, £275 5s.; pilotage, £493 3s. 4d.; dues, £48 12s.; ad valorem, £3,851 12s. 10d.; package charge, £2,612 9s.—Total, £54,841 10s. The receipts during the corresponding month of last year were £75,308; there is therefore a comparative decrease in the month of £20,467. Taking the whole of the receipts, during the first five months of this year, we find that they are £25,615 less than those of the same period of 1866; the amounts being—first five months of 1866, £337,958; ditto of 1867, £312,343. The following table will show each month's receipts during the periods referred to:—

	1866.	1867.
January	£68,140	£77,875
February	64,267	66,916
March	64,491	55,073
April	65,752	57,638
May	75,308	54,841
	£337,958	£312,343

The yield of the new gold-fields at Emu Creek has caused the escort returns for last month to show a gratifying increase on the preceding months of this year. The quantity received from the various gold-fields during May amounted to 19,549 oz., of which 14,550 oz. was from the Western mines, 3,439 from the Southern, and 1,560 from the Northern. During the month of May, 1866, the receipts were—Western, 11,948 oz.; Southern, 8,095; Northern, 1,566. On comparing the two periods, it will be seen that there is an increase of 2,602 oz. in the receipts from the Western, but a decrease of 5,666 oz. in the Southern, and of only 6 oz. in the Northern. The gross receipts from January 1st to the 31st ultimo, amounted to 78,838 oz., as against 95,038 oz. received during the corresponding period of last year—a decrease of 19,200 oz. The following table shows the quantities of gold received by the various escorts during the four months of 1866 and 1867:—

	1866.	Western.	Southern.	Northern.
January	9,464	7,131	1,338	
February	9,363	7,255	1,543	
March	8,355	7,346	2,413	
April	11,559	5,975	1,687	
May	11,948	8,095	1,566	
		50,689	35,802	8,547
1867.				
January	8,325	2,670	2,334	
February	8,210	5,819	1,124	
March	8,941	5,698	2,127	
April	9,311	3,474	1,226	
May	14,550	3,439	1,560	
		49,337	21,130	8,731

As in some cases large amounts have been recently brought down by private hands, it is becoming more difficult to arrive at the real yield of our gold-fields.

WINE IN AUSTRALIA.—We (*Observer*) need hardly say that the Customs' laws of Victoria are a real grievance to our vignerons. The duty of 3s. a gallon is prohibitive of all but our highest-class wines. This is, perhaps, not an unmixed evil. It prevents our manufacturers sending any but their best wines, so that the Victorians see our highest samples. Still the evil is a great one, and all the greater because the same law does not apply to the wines of New South Wales. We have to contend against a protective duty almost equal to the original value of the article. And it says much for the excellence of our productions, that notwithstanding this they have taken and retain a high position amongst our neighbours. There are gentlemen in Victoria who are exceedingly anxious to see this vexatious restriction abolished, that for the sake of their own colony they might be able to import our superior wines at moderate prices. And we can only indulge the hope that before long some means may be found to place our vignerons in a fairer position, and that they who have sunk so much capital and spent so much anxious labour in wine making may have the Victorian market open to them. There is not a more useful work to which our Government could address themselves than this. Free trade in native wines with Melbourne would be of incalculable advantage to us just now, when most of our interests are in a languishing condition. The total value of our wines which entered Victoria in 1866 was only £2,262. Now, if the duty were removed, this amount could easily be increased tenfold, and new life would be put into the trade in this colony.

AGRICULTURAL STATISTICS OF NEW SOUTH WALES.—The following statistics are compiled from the *Statistical Register* for 1865:—The number of occupiers of land (exclusive of those for pastoral purposes) is 22,509; of these 13,818 were freeholders, and 8,691 leaseholders. The extent of their holdings is estimated at 7,277,355 acres, of which 4,590,406 acres were freeholds, and 2,686,849 acres leaseholds. There are 381,400 acres under general cultivation; 131,653 acres with wheat crops; 113,442 acres with maize; 5,843 acres with barley; 10,939 acres with oats; 15,290 acres with potatoes; 61,909 acres with hay. The cultivation of cotton has fallen off, only 11 acres have been cultivated, yielding 380lbs. The culture of tobacco extends over 1,499 acres, producing 7,469 cwt. of the weed. Upwards of 141 acres have been taken up for the cultivation of the sugar-cane, and last year produced 5,700lbs. The acreage for green food for cattle is 21,252; and for market-gardens and orchards 10,492 acres. Upwards of 2,126 acres are taken up for vineyards. The quantity of wine produced last year was 168,123 gallons; brandy, 1,439 gallons; besides upwards of 559 tons of grapes taken for table use.

STEAM TRAFFIC ON THE MURRAY.—As the time is now approaching for the resumption of traffic on the great inland streams, the steamers engaged in the Murray, Murrumbidgee, and Darling are making active preparations for a busy season, and, should the much wished for rainfall be propitious, they will shortly be engaged between the different towns on the Riverina. The advantage derivable to the vast tracts of country from these steamers is unquestionable, as they afford great facilities for the transmission of wool from the inland pastoral districts, and also for the carriage of stores to the different stations in the interior. The disadvantages against which they have to contend is considerable, arising from droughts which keep the river low, and also from the snags in the river. The tonnage of the fleet employed in this trade is over 2,000 tons, and gives employment to a great number of hands. There are over 30 steamers employed in this trade, averaging in size from 20 to 120 tons. Some of these steamers are entirely built of iron, but the greater proportion are wooden vessels. Besides the boats above mentioned, there are others which trade from Adelaide to the Darling and Murrumbidgee without coming up to Echuca. For

the convenience of steamers calling at Echuca, a splendid wharf has been built, alongside of which runs the Victorian line of railway, on which a large traffic is done in the wool season. Great complaints are made about the crane accommodation at this wharf; there are at present two only, an 8 ton and a 5 ton. A large and increasing amount of machinery is being transported by way of Echuca to Riverina every year, and a powerful crane would be of great service in facilitating its shipment. As feeders to the Victorian Railways these steamers perform a prominent part, and if the charges for the conveyance of produce from Echuca to Melbourne by rail could only be fixed so as to bear a proportion to the charges by water, a greatly increased traffic would result. At present the steamers take great quantities of wool to Goolivra, from whence, after a short transit, it can be brought by the sea to Melbourne at a cheaper rate than if forwarded by rail from Echuca. The principal route for the forwarding of wool to Melbourne is certainly by Echuca, but when there comes to be a difference of £2 per ton in the carriage, it is hardly to be wondered at, that settlers prefer the slower though cheaper mode of transit. It is to be regretted that the railway does not command the great bulk of that traffic for which it was originally constructed.

SYDNEY AGRICULTURAL EXHIBITION.—The annual exhibition of the Agricultural Society was held in the government domain at Paramatta, on the 24th and 25th May, which was on the whole a decided success, most of the exhibits being very superior. The show of pigs and poultry was very good, and there were also some very fine samples of colonial wines and other products exhibited. The show of fruit was small, and chiefly confined to oranges. There was an excellent collection of farming implements, buggies, and miscellaneous articles. Among the agricultural products were some samples of maizena and arrowroot, which were particularly good. The cultivation of maize and arrowroot for the purpose of producing these articles in large quantities will no doubt turn out a very remunerative speculation.

WHEAT IN MELBOURNE.—Wheat has been sown under favourable circumstances, and a great breadth of land is now under that crop, but owing to the present low price of grain there is no chance of cereal crops paying unless the yield is large, so our farmers are every year giving more attention to grass, dairy, and sheep farming. Wheat has been low ever since harvest, but the demand for export has been steady, and the quantity sent away has greatly relieved the market. There is not an agricultural district which has not a large surplus this year; and judging by the extent of land already sown, it will be the same next year if the coming season is at all prolific. Stock is in fine condition, the grass having been good ever since last spring, and it is long since a winter has been commenced under better prospects than the present.

Obituary.

PROFESSOR FARADAY.—The members will hear with sincere regret of the death of Professor Faraday, which took place on Sunday, the 18th inst., near Hampton-court. Michael Faraday was born in 1791, in the parish of Newington, Surrey, and, like many others who have illustrated the page of British history, was entirely a self-made man. After being instructed in the mere rudiments of knowledge, he was apprenticed to a book-seller and bookbinder, and continued to work at his trade till 1812. During this early period of his life, however, he showed the bent of his genius, for, in the intervals of his employment, he not only read with avidity such works on science as fell in his way, but applied himself to the construction of electric and other machines. Having been present at some of the last lectures delivered by Sir H. Davy, Faraday wrote to that distinguished chemist—asking him for encouragement, and at the same time inclosing notes of the lec-

tures at which he had been present. Sir H. Davy answered the request of the young aspirant promptly and kindly, and in 1813 he was admitted in the Royal Institution as chemical assistant to Professor Brande. Faraday soon became the favourite pupil and the friend of his patron, whom he accompanied in the autumn of the same year in a visit to France, Italy, Switzerland, &c., returning to his place in the Royal Institution in 1815. He now pursued his investigations of nature with great ardour, and published the results in various scientific journals. In 1820 he discovered the chlorides of carbon, and the year following the mutual rotation of a magnetic pole and an electric current; in 1823 the discovery of the condensation of gases; in 1831 and following years the development of the induction of electric currents, and the evolution of electricity from magnetism. The establishment of the principle of definite electrolytic action, the discovery of diamagnetism, and the influence of magnetism upon light, obtained for him, in 1846, the Rumford medal, and that of the Royal Society. In 1847 he announced to the world the magnetic character of oxygen, and the magnetic relations of flame and gases. When Mr. Fuller founded the chair of chemistry, in the Royal Institution, in 1833, Mr. Faraday was appointed first professor. In 1835 he received a pension of £300 a year from Lord Melbourne's Government, in recognition of his important services to science. In the following year he was appointed scientific adviser on lights to the Trinity House, and was subsequently nominated to a similar post under the Board of Trade. He was chemical lecturer from 1829 to 1842 to the cadets at the Royal Military Academy at Woolwich. In 1823 he was made a corresponding member of the Academy of Sciences in Paris; in 1825 he was elected a Fellow of the Royal Society; and in 1832 the honorary degree of Doctor of Civil Laws was conferred on him by the University of Oxford. He was a Knight of the Prussian Order of Merit, of the Italian Order of St. Maurice and Lazarus, and one of the Eight Foreign Associates of the Imperial Academy of Sciences of Paris. In 1855 he was nominated an officer of the Legion of Honour, and in 1863 he was made an associate of the Paris Academy of Medicine. He was elected a member of the Society of Arts in 1819, and took an active part in the proceedings of its committees. In 1866 he received the Albert Gold Medal of the Society for "his discoveries in electricity, magnetism, and chemistry, which, in their application to the industries of the world, have largely promoted Arts, Manufactures, and Commerce." Although the late Professor chiefly confined himself to experimental researches, there are theoretical views thrown out with regard to static induction, atmospheric electricity, the lines of force, both representative and physical, which are well worthy of consideration. His papers on the conservation of force, and on the division of gold and other metals are amongst his latest productions. His lectures adapted for young minds, delivered at the Royal Institution during Christmas time, will not easily be forgotten. The ease with which he descended from the heights of science, and conveyed in the minds of his youthful listeners the scientific principles of "common things," was not the least of the many gifts possessed by Dr. Faraday. But it is in connection with electricity, and its relations with almost all physical, chemical, and physiological phenomena that his fame will principally depend. His investigations on this subject led him to the presumption that electricity, magnetism, and light are but one and the same force, varying in effect according to circumstances, but obedient to laws which will one day be discovered.

Publications Issued.

THE FOULING AND CORROSION OF IRON SHIPS: their causes and means of protection, with the mode of appli-

cation to the existing iron-clads. By Charles F. T. Young, C.E. One vol., octavo. The fouling and corrosion of iron ships is still a problem unsolved. The author has made researches into the subject, and his book goes into its history, from early times down to the present. The author believes, as the result of his investigation, that the method of Mr. Daft, by means of zinc sheathing, as described by Mr. S. J. Mackie in his paper read before the Society during the last session, is in all respects "the soundest, the simplest, and most practical, and from being arranged in accordance with the known laws of nature, most certain of success." The work contains 212 pp., with seven wood engravings and two lithographs.

Notes.

FRESH HONOURS TO MEN OF SCIENCE, &c., IN FRANCE.—M. Claude Bernard, member of the Institut, and professor at the College of France, has been made Commander of the Legion of Honour. MM. Bertrand, D'Archiac, Delaunay, Hernute, members of the Institut; Bertholet, professor at the College of France; Abria, Dean of the Faculty of Science at Bordeaux; Bédard, member of the Academy of Medicine; Dr. Caffé, of the scientific press; De Chaumont, director of the Institut des Provinces; and Aubergier, Dean of the Faculty of Sciences of Clermont, promoted to the grade of Officers; and MM. Trécul, of the Institut; Fouqué, author of a work on the eruptions of Etna, and Santorin and Simonin, writers on scientific subjects, Chevaliers.

PROFESSIONAL FEMALE EDUCATION IN FRANCE.—Amongst the many excellent establishments which have been set on foot during the last few years in Paris is the *Société Lémonnier*, for the professional education of girls, presided over by the wives of several well known statesmen, M. Jules Simon amongst the number, and other ladies. The society is only four years old, but it possesses two schools, one having two hundred and the other nearly one hundred pupils. The mornings are devoted to general instruction and the application of science to the common wants of life, and the afternoons to professional study, such as book-keeping, and other commercial pursuits, drawing, engraving on wood, porcelain painting, making up clothes, linen, &c. Three engravings by pupils of the school were admitted to the last annual exhibition of pictures in Paris, and the collection of the school has now a silver medal from the jury of the International Exhibition. The school is unconnected with any sect, and, consequently, there is no question raised respecting the religion of the pupils or their parents; the catechism is replaced by simple moral lessons; there is a large library attached to each school, principally the result of donations from authors and publishers.

Patents.

From Commissioners of Patents' Journal, August 23rd.

GRANTS OF PROVISIONAL PROTECTION.

Athletic exercises, apparatus employed in—2265—W. Frangley.
Boats—2287—H. W. Withers.

Brushes—2090—H. A. Bonneville.
Cartridges and fire-arms—2277—A. J. Paterson.
Chimney tops—2297—C. Hohngrete.
Cloth, apparatus for staking—2361—T. S. Cressy and J. W. Coprolites, washing—2316—J. J. Rawlings and H. Wilkins.
Dredging machines—2278—R. H. Mitchell.
Felted machines—2265—W. Wilson.
Fire-arms, breech-loading—2263—G. Schneider.
Fires, extinguishing—2200—J. Jones.
Fires, igniting—2189—W. L. Leaver and A. Smalley.
Flour, manufacturing—2291—T. J. Baker.
Gas and air (combined) engines—2245—C. D. Abel.
Glass, &c., moulding designs in—2267—L. V. Hux and C. H. Harrows—2261—W. R. Grace.
Hop, manufacturing extract and essence of—2132—T. A. R. Hydraulic lifts—2236—J. H. Johnson.
Knives and forks—2296—W. J. Miller.
Letter-stamping machines—2288—F. Wirth.
Looms—2302—G. Hodgson.
Looms—2306—R. Edmondson.
Medicines, dispensing, preparing drugs, &c.—2229—E. A. K. Metallic alloy—2286—A. M. Clark.
Metals, removing impurities from—2308—C. D. Abel.
Metals, &c., preserving the surfaces of—1113—R. Alexander.
Motive-power—2289—J. E. F. Lideke.
Nails, manufacturing cut—2296—R. Heathfield.
Paper bags—2263—J. P. Binns.
Paper, waterproof—2267—T. Whittaker and M. Rorba.
Peat, &c., preparing—2233—F. L. H. Danobell.
Printing presses—2260—W. R. Lake.
Pulleys for window frames—2273—F. Ryland.
Railway points and signals—2234—J. Edwards.
Reeds for weaving—2269—A. M. Clark.
Sawmills, &c., splitting and cutting—2310—B. Corria.
Sewage machines—2275—E. Cornely.
Slate, &c., machine for cutting—2177—W. E. Gedge.
Steam engines, marine—2003—J. M. Gray.
Steam generators—2312—J. H. Evers.
Steam, &c., indicating and registering the pressure of—26 Budeberg.
Stringed instruments—2298—H. A. Bonneville.
Sugar, clarifying—2237—E. T. Marler.
Sulphuric acid—2289—W. J. Pughstey.
Telegraph cables—2241—T. Allan.
Telegraphs—2207—S. M. Martin and S. A. Varley.
Textile fabrics, &c.—2243—J. Smith.
Trenails—2271—E. J. W. Parnacott.
Twine or cord box—2293—F. J. Seymour.
Valves—2300—J. Davenport and J. Kilson.
Water-closets, &c.—2253—G. W. Dinsdale.
Windows, apparatus for cleaning—2304—G. Warsop.
Wood, reducing to shreds, to be used in the manufacture of pulp—2261—C. de Negri.

INVENTIONS WITH COMPLETE SPECIFICATIONS PAID.

Casks, cleaning—2345—J. Peacock.
Vessels, propelling—2362—H. Bodart and A. Sigodart.

Journal of the Society of Arts.

FRIDAY, SEPTEMBER 6, 1867.

Announcements by the Council.

ARTIZANS' VISITS TO PARIS.

Her Majesty's Government have granted to the Society of Arts, in aid of the fund now being raised by the Society for assisting workmen, specially selected from various trades, to visit and report on the Paris Exhibition, the sum of £500, conditional on the Society raising a like amount by public subscription.

The following is the list of subscriptions up to the present date:—

H.R.H. THE PRINCE OF WALES, President ..	£31	10	0
HER MAJESTY'S GOVERNMENT (conditional) ..	500	0	0
Society of Arts ..	105	0	0
Earl Granville, K.G. ..	5	0	0
Lord de L'Isle ..	10	0	0
Thomas Twining ..	2	2	0
Sir J. P. Boileau, Bart. ..	5	0	0

Fellows, Henry	Electro-plate and plating vases.
Petit, J. L.	Steel pens.
Ansell, James	Church and other bells.
Fisher, John	Gas and other tubes.
Dodd, J.	Chandeliers and gas-fittings.

M. Haussoullier, the officer in charge of the British Workmen's Hall at the Paris Exhibition, and of the arrangements for affording all kinds of facilities, reports that upwards of 1,700 artisans used the Hall in the month of August, and the visits were made, generally by parties of about five artisans each, to 161 workshops of different kinds. Some artisans visited more than one workshop. M. Haussoullier adds, "The names sent by the Society of Arts are by far the most intelligent upon the whole, and are most anxious in their inquiries upon the condition *économiques et morales* of the French artisans."

Messrs. J. M. Johnson and Sons have kindly placed at the disposal of the Council a number of their five-shilling English Catalogues of the Exhibition, sufficient to present each workman with a copy.

Proceedings of Institutions.

WHITBY INSTITUTE.—The report for last year, being the twenty-first, records a serious decrease in the number of members, and a lessening of the income of the society. This decrease has not, however, taken place to any marked extent amongst the yearly members; but the shorter-period members have fallen off greatly. The last exhibition, to which a donation of £5 was given by the Society of Arts, was most successful. No less than £62 15s. was given in prizes. The goods shown in surpassed, both in number and taste, those of former years, and the attendance of visitors was larger than

heretofore. The exhibition was opened by the Mar-
chioness of Normanby, and in the distribution of prizes
the Marquis of Normanby presided. During the winter
months a series of penny readings was instituted, which
succeeded admirably. The attendance was always good,
and generally the room was crowded to excess. In a
pecuniary sense, also, the readings were of some advan-
tage to the Institute, as they left a profit of £9 17s. 7d.
An arrangement was made for the drawing class to meet
three evenings in each week, instead of one. The charge
for admission to the class was fixed at the moderate sum
of fourpence per week, and the attendance increased
largely, the total number of pupils reaching 54, several
of whom had been students in former years; and one
pleasing character of the class was the increased atten-
dance of youths engaged in the jet trade, and for their
special benefit a class for original designing was com-
menced. Still further to encourage this useful class,
Mrs. Thomas Bagnall has offered £4, to be given in
prizes, for the best designs for jet articles. The general
instruction class was conducted, as before, and, in addi-
tion to these, a chemical class was carried on for a part
of the winter season.

EXAMINATION PAPERS, 1867.

The following are the Examination papers set in the
various subjects at the Final Examination held in April
last :—

LATIN AND ROMAN HISTORY.

THREE HOURS ALLOWED.

SECTION I.

Translate :—

Parcus deorum cultor et infrequens,
Insanientis dum sapientiae
Consultus erro, nunc retrorsum
Vela dare atque iterare cursus
Cogor relictos : namque Diespiter,
Igni corusco nubila dividens
Plerumque, per purum tonantes
Egit equos volucrumque currum,
Quo bruta tellus et vaga flumina,
Quo Styx et invis horrida Taenari
Sedes Atlanteusque finis
Concitur. Valet ima summis
Mutare, et insignem attenuat deus,
Obscura promens : hinc apicem rapax
Fortuna cum stridore acuto
Sustulit, hic posuisse gaudet.

—*Hor : Carm : I. 34.*

1. Parse fully, giving both *accidence* and *syntax*, the words *sapientiae*, *iterare*, *quo*, *concutitur*, *summis*, *posuisse*.

2. Give the present and perfect tenses indicative and the supines of the verbs *dare*, *egit*, *promens*, *sustulit*, *gaudet*.

SECTION II.

Translate :—

Nunc est bibendum, nunc pede libero
Pulsanda tellus, nunc Saliaribus
Ornare pulvinar deorum
Tempus erat dapibus, sodales.
Antehac nefas depromere Caecubum
Cellis avitis, dum Capitolio
Regina dementes ruinas
Funus et imperio parabat
Contaminato cum grege turpium
Morbo virorum, quidlibet impotens
Sperare fortuneque dulci
Ebria. Sed minuit furor

Vix una sospes navis ab ignibus,
Mentemque lymphatam Mareotico
Redegit in veros timores
Caesar, ab Italia volentem

Remis adurgens : accipiter velut
Molles columbas, aut leporem citus
Venator in campis nivalis
Haemoniae -, daret ut catenis

Fatale monstrum. Quae generosius
Perire quaerens, nec muliebriter
Expavit ensem, nec latentes
Classe cita reparavit oras.

Ausa et jacentem visere regiam
Vultu sereno, fortis et asperas
Tractare serpentes, ut atrum
Corpore combiberet venenum,

Deliberata morte ferocior ;
Saevius Liburnis scilicet invidens,
Privata deduci superbo
Non humilis mulier triumpho.

—*Hor : Carm : I. 37.*

1. Explain the meaning of *Saliaribus*, *Caecubum*, *Regina*, *Mareotico*, *Liburnis*.

2. Parse fully, giving both *accidence* and *syntax*, the words *dapibus*, *depromere*, *morbo*, *fortunâ*, *ensem*, *combiberet*, *Liburnis*, *deduci*.

SECTION III.

Translate :—

Sed haec quidem, quae dixi, cor, [*sanguinem*,] cerebrum, animam, ignem vulgo : reliqua fere singuli. Ut multi ante veteres, proxime autem Aristoxenus, musicus idemque philosophus, ipsius corporis intentionem quandam, velut in cantu et fidibus quae harmonia dicitur, sic ex corporis totius natura et figura varios motus cieri tamquam in cantu sonos. Hic ab artificio suo non recessit et tamen dixit aliquid, quod ipsum quale esset erat multo ante et dictum et explanatum a Platone. Xenocrates animi figuram et quasi corpus negavit esse verum : numerum dixit esse, cujus vis, ut jam ante Pythagorae visum erat, in natura maxima esset. Ejus doctor Plato triplicem finxit animum, cujus principatum, id est, rationem in capite sicut in arce posuit, et duas partes ei parere voluit, iram et cupiditatem, quas locis discluit : iram in pectore, cupiditatem subter praecordia locavit.

—*Cic : Tusc : Quest : I. 10.*

1. Parse fully, giving both *accidence* and *syntax*, the words *reliqua*, *intentionem*, *motus*, *vis*, *triplicem*, *locis*, *discluit*.

2. Give the present and perfect tenses indicative and the supines of the verbs *recessit*, *negavit*, *posuit*, *parere*.

SECTION IV.

Translate :—

Omnes magni, etiam superiores, qui fruges, qui vestitum, qui tecta, qui cultum vitae, qui praesidia contra feras invenerunt : a quibus mansuefacti et ex culti a necessariis artificii ad elegantiora defluximus. Nam et auribus oblectatio magna parta est inventa et temperata varietate et natura sonorum et astra suspeximus quum ea, quae sunt infixa certis locis, tum illa non re, sed vocabulo errantia : quorum conversiones omnesque motus qui animus vidit, is docuit similem animum suum ejus esse, qui ea fabricatus esset in caelo. Nam quum Archimedes lunae, solis, quinque errantium motus in sphaeram illigavit, effecit idem quod ille qui in Timaeo mundum aedificavit Platonis deus, ut tarditate et celeritate dissimillimos motus una regeret conversio. Quod si in hoc mundo fieri sine deo non potest, ne in spacia quidem eosdem motus Archimedes sine divino ingenio potuisset imitari.

—*Cic : Tusc : Quest : I. 26.*

1. Parse fully, giving both *accidence* and *syntax*, the words *mansuefacti*, *auribus*, *varietate*, *suspeximus*, *ejus*, *idem*, *celeritate*, *potuisset*.

2. Account for the mood of *esse*, *fabricatus esset*, *regerat*, *potuisset*.

SECTION V.

1. Give an account of the war with the Volsci which immediately preceded the proposal of the Terentilian Law?

2. What was the purpose of the First Decemvirate, and what of the Second? What part of the Decemviral legislation was afterwards maintained?

3. Give an account of Camillus?

4. What reasons could be urged for and against the removal from Rome to Veii?

5. What were the three Comitia? By what steps did the Comitia Tributa become practically supreme?

6. How was the senate filled? What were its powers?

SECTION VI.

1. Give an account of Papirius Cursor?

2. Give a brief sketch of the second Punic war?

3. What was the general drift of the legislation of Sulla?

4. Give an account of the Gracchi and their measures?

5. Describe the parties of the Populares and Optimates in the time of Cicero?

6. To what causes must we assign the fall of the Republic?

FRENCH.

THREE HOURS ALLOWED.

PART I.

Candidates for a third-class certificate are to translate the following extract into English, and to answer the grammatical questions thereto annexed, in the order in which they are placed. The first part is all that is required of them.

L'invention de l'imprimerie est le plus grand événement de l'histoire. C'est la révolution-mère. C'est le mode d'expression de l'humanité qui se renouvelle totalement, c'est la pensée humaine qui dépouille une forme et qui en revêt une autre, c'est le complet et définitif changement de peau de ce serpent symbolique qui, depuis Adam, représente l'intelligence.

Sous la forme imprimée, la pensée est plus impérissable que jamais; elle est volatile, insaisissable, indestructible. Elle se mêle à l'air. Du temps de l'architecture, elle se faisait montagne et s'emparait puissamment d'un siècle et d'un lieu. Maintenant elle se fait troupe d'oiseaux, s'éparpille aux quatre vents, et occupe à la fois tous les points de l'air et de l'espace.

Nous le répétons, qui ne voit pas que de cette façon elle est bien plus indélébile? De solide qu'elle était elle devient vivace. Elle passe de la durée à l'immortalité. On peut démolir une masse, comment extirper l'ubiquité? Vienne un déluge, la montagne aura disparu depuis longtemps sous les flots, que les oiseaux voleront encore; et qu'une seule arche flotte à la surface du cataclysme, ils s'y poseront, surnageront avec elle, assisteront avec elle à la décrue des eaux, et le nouveau monde qui sortira de ce chaos verra en s'éveillant planer au-dessus de lui, ailée et vivante, la pensée du monde englouti.

Dès le seizième siècle, la maladie de l'architecture est visible; elle n'exprime déjà plus essentiellement la société; elle se fait misérablement art classique; de gauloise, d'euro péenne, d'indigène, elle devient grecque et romaine; de vraie et de moderne, pseudo-antique. C'est cette décadence qu'on appelle la renaissance. . . . C'est ce soleil couchant que nous prenons pour une aurore.—Victor Hugo, *Notre-Dame de Paris*.

1. Parse the first three sentences of the above extract (down to "*l'intelligence*").

2. Give the five primitive tenses of the verbs:—*Revêt, se faisait, voit, devient, peut, aura disparu, sortira, prenons*.

3. "*Qui en revêt une autre*" (4th line). Can you explain this construction of the pronoun *en*, which is of frequent occurrence in French?

4. Explain the words *l'*, *au*, *aux*, *du*, *des*.

5. Give the feminine of the adjectives *fraîs*, *long*, *public*, *vieux*, *mou*, *singulier*, *complet*, *blanc*, *malin*, *définitif*.

6. "*Se renouvelle*" (3rd line). When is the final *t* or *t* thus doubled in verbs ending in *eler* or *eter*?

7. "*Bien plus indélébile*." "*Elle n'exprime déjà plus*." Explain the different uses of the adverb *plus*, and show with an example when "*more*" should be rendered by "*d'avantage*" instead of "*plus*."

8. Give the adverbs corresponding to the adjectives *cher*, *doux*, *faux*, *grossier*, *ardent*, *constant*, *vif*, *bon*, *mauvais*, *moindre*, *petit*, *sec*.

9. Can the adjectives referring to the pronoun "*on*" be construed in the feminine or in the plural? Give examples.

10. Write in full:—80 pages; page 80; 300 ans; l'an 1100; 85 livres; 120 personnes.

11. Give, with suitable examples, any three important rules on the syntax of French pronouns.

12. Distinguish between *an*, *jour*, *matin*, *soir*, and *année*, *journée*, *matinée*, *soirée*.

Translate into French:

A year ago. The last year of his reign.

We spent a pleasant day with them. The day is not fixed.

I am going to see him this evening. I shall spend the evening with him.

I take a walk every morning. What a fine morning!

PART II.

Candidates for a second-class certificate are to answer questions 11 and 12 in Part I., together with those in Part II., and to translate the English extracts and idiomatic expressions which follow.

Grammar.

1. Give some general rules as to the place of the adjective in a French sentence, and show with examples how the meaning of some adjectives is affected by the place assigned to them.

2. Illustrate with examples the principle of *euphony* as applied throughout the French syntax.

3. Write ten altogether different sentences in which the verb of the subordinate proposition, whilst used in the indicative or conditional mood in English, must be construed in the subjunctive mood in French.

4. When is *ne* to be introduced idiomatically after *craindre que*, *douter que*, *nier que*? Give examples for each verb.

5. Give the verb that corresponds to each of these adjectives:—*Beau*, *fort*, *faible*, *vieux*, *laid*, *lent*, *tardif*, *gras*, *jeune*, *gris*, *vert*, *gaillard*, *mou*, *ridicule*, *fou*.

6. Explain this line of Racine:—
Je t'aimais inconstant, qu'aurais-je fait fidèle?

Translation.

Rogers is silent, and it is said, severe. When he does talk, he talks well, and on all subjects of taste his delicacy of expression is pure as his poetry. If you enter his house, his drawing-room, his library, you of yourself say, this is not the dwelling of a common mind. There is not a gem, a coin, a book, thrown aside on his chimney-piece, his sofa, his table, that does not bespeak an almost fastidious elegance in the possessor. But this very delicacy must be the misery of his existence. Oh! the jarrings his disposition must have encountered through life.—BYRON.

Unfortunately, it is too much the practice of governments to nurse and keep alive in the governed their national prejudices. It withdraws their attention from what is passing at home, and makes them better tools in the hands of ambition. Hence next-door neighbours are held up to us from our childhood as natural enemies; and we are urged on like curs to worry each other.

In like manner we should learn to be just to individuals. Who can say, "In such circumstances I should have done otherwise?" Who, did he but reflect by what slow gradations, often by how many strange concurrences, we are led astray; with how much reluctance,

how much agony, how many efforts to escape, how many sighs, how many tears—who, did he but reflect for a moment, would have the heart to cast a stone? Fortunately these things are known to Him from whom no secrets are hidden; and let us rest in the assurance that His judgments are not as ours are.—SAMUEL ROGERS.

Idioms.

1. Elle en aura une attaque de nerfs.
2. Veuillez ne pas trouver mauvais que je l'en prévienne.
3. Je sais à quoi m'en tenir.
4. Là-dessus, il s'est répandu en invectives.
5. Je ne me tiens pas pour battu.
6. Il est né coiffé.
7. Vous trouverez chaussure à votre pied.
8. Ils font maigre en carême.
9. Il lui a fallu plier bagage.
10. Nevendez pas la peau de l'ours avant de l'avoir pris.
11. Elle est vive à la riposte.
12. Il ne sait plus de quel bois faire flèche.
13. Il court sur vos brisées.
14. Ne le prenez pas en mauvaise part.
15. Partagez le différend, et qu'il n'en soit plus question.
16. Si vous n'y prenez garde, il prendra un mauvais pli.

PART III.

Candidates for a first-class certificate are expected to translate the above idioms and English extracts, and to answer in French the grammatical questions Nos. 3, 6, and 6 in Part II., as also the following:—

Literature.—I. Name the principal works of Chateaubriand. Sketch his life, and describe the tone and influence of his writings.

2. Describe the great literary movement in France under the Restoration, and show its influence upon the public mind, and the subsequent political events.

3. Name any five of the standard literary works that were first published between 1815 and 1830.

History.—1. Explain briefly the expressions:—*Fédération du Champ de Mars*; *Girondins*; *Jacobins*; *Montagnards*; *Septembristes*; *Terroristes*; *Coup d'état du 18 Brumaire*; *Les Cent Jours*.

2. Give a short account of any one of the treaties of Campo-Formio, Amiens, and Tilsit.

(To be continued.)

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

The thirty-seventh annual meeting of the British Association opened on Wednesday evening in Dundee. The present is the first visit of the Association to that city.

The attendance at the present meeting, though not equal to that which has been noted at towns of larger size, is nevertheless considerable, nearly 2,000 tickets having been issued up to Wednesday evening. The principal office-bearers of the year are:—President, the Duke of Buccleuch, K.G.; Vice-Presidents, the Earl of Airlie, Lord Kinnaird, Sir John Ogilvy, M.P., Sir David Baxter, Sir Roderick Impey Murchison, Director-General of the Geological Survey of Great Britain and Ireland; Sir David Brewster, Principal of the University of Edinburgh; and Dr. James Forbes, Principal of the United College, St. Andrews. The secretaries are Mr. Galton and Professor Hirst, with Mr. Griffiths, assistant-secretary, and Messrs. Henderson, Anderson, and Glogau, local secretaries. Mr. William Spottiswoode attends as general treasurer, and Mr. Alexander Scott officiates as local treasurer. The following gentlemen are the presidents of the sections:—A, Mathematical and Physical Science, Professor Sir W. Thomson, D.C.L.; B, Chymical Science, Professor Thomas Anderson, Glasgow University; C, Geology, Mr. A. Geikie; D, Biology, Professor Sharpey; E,

Geography and Ethnology, Sir Samuel Baker; F, Economic Science and Statistics, Mr. Grant Duff, M.P.; G, Mechanical Science, Professor W. J. M. Rankine, University of Glasgow.

The inaugural meeting was attended by above 2,000 persons. The chair was taken, in the absence from indisposition of Mr. W. R. Grove, by Sir Roderick Murchison, who introduced to the audience the president elect, the Duke of Buccleuch, who delivered an address.

Professor Phillips moved, and the Provost of Dundee seconded, a vote of thanks to his Grace, and the meeting separated.

PARIS EXHIBITION.

The trial of the steam ploughs, which has been delayed by causes not very clearly explained, is announced to take place during the present month of September, at the Imperial farm at Vincennes, but the day is not yet mentioned. This, however, will not be the only occasion on which the steam ploughs of England will have an opportunity of trying their strength against each other and the rest of the world, for a private subscription has been set on foot, which, it is said, will supply the means for another and more extensive series of trials during the same month; the trials are looked forward to by French agriculturists with great interest, and there is no doubt that England will feel it, at least to as great an extent.

The manufacture of decorated porcelain and earthenware exhibits remarkable progress at the present moment, especially in France and England; the annual value of fine *faïences* produced in France is said to be ten millions of francs (£400,000), and that of china about twice that amount. One of the causes, or rather means, of the extension of the latter manufacture, is the substitution of coal furnaces in place of the costly method of wood-burning previously in use, while the introduction of medallions, slabs, and ornaments of decorated *faïence* in construction has given a great impulse to the trade, inducing the manufacturers to produce larger pieces of ware, which require special attention and study. The number of persons employed in the decoration of ceramic work in Paris alone is said to be 1,362 men and 458 women.

The number of visitors to the Exhibition is still considerably less than it was some weeks ago, the average daily attendance being, according to some semi-official returns, between 40,000 and 50,000. The number has, however, reached 60,000, and on one occasion 80,000, within the last few days, and the provinces are beginning to send up large contingents again. The inhabitants of the wine-producing provinces, however, will not be able to leave home for some time on account of the vintage, and therefore it is probable that the present month will not bring such large numbers to the Exhibition as the final month of October. Parties continue to arrive from Germany and the North, principally artisans, but including students from Upsal and other universities; these young men are in some cases dressed uniformly, and almost all wear caps, rosettes, or other objects indicating the party to which they belong.

Important corrections in the list of awards are announced from time to time, and therefore there is ground for hope that the most serious, if not all, the errors caused by the attempt to adjudge the prizes in too short a space of time will be corrected. Many people in England object to the system *in toto*, but this is not the feeling on the Continent, and while juries exist it is most important that the examination of the objects exhibited should be more complete, and the consideration of their claims to reward more careful than could possibly be the case in the short period allowed for the operations of the juries in the case of the present Exhibition.

The question of concessions has been another fertile source of complaint, and one of these has given rise to a very unpleasant act. The Imperial Commission granted to a M. Bernard the sole right of letting chairs to the

public, in consideration of his paying a certain sum of money for the privilege; the restaurant-keepers of all countries, who pay heavy rents to the Commission, placed tables and chairs outside their establishments for the use of their customers, an act which M. Bernard regarded as an infringement of his privileges, and against which he protested. Failing in his attempts, he had recourse to the tribunals, brought an action against the Imperial Commission, and obtained a verdict in his favour; in consequence of this decision, the Imperial Commission, having given due notice to the proprietors of the restaurants and cafés to remove their chairs, and the latter having declined to do so, swept them all away. An appeal has been made to the proper tribunal on the subject, but the court ruled that the Commission was compelled by the decision against it to act as it had done. It is well that occurrences of this kind should be made known and well considered before the interest has departed from them, not with any intention of throwing blame upon the Commission and officers, who have most onerous duties to perform, but in order to supply hints which may be of use on future occasions.

It is said that a beautiful cabinet, for which a grand prize was awarded to M. Fourniois, of Paris, has been purchased for the South Kensington Museum. M. Fourniois has in the production of this cabinet combined the art of inlaying with carving. The design being laid down upon one piece of wood, and this laid upon a piece of a different colour, say box upon ebony, for a strong contrast, the design is cut out by the ribbon saw, and the pieces thus separated being changed, you have in one case a yellow ornament on a black foundation, and in the other the reverse. The carver may now cut away the ground to any extent necessary for the relief of the pattern, and may act upon the two pieces of wood separately or in their proper relative positions as may be most convenient. There is also another important advantage in the system. Suppose it is required to decorate the face of a bracket, or any other portion of a work having an irregular outline, two pieces of wood of the colour required are selected and the ornament cut out by means of the saw; the pieces are then separated, and the desired form given to the ground piece by means of the beading plane or other tools; the carver will then operate upon the other piece, giving the ornament whatever amount of relief may be required.

SUEZ CANAL.

The Suez Canal Company have given a very complete representation at the Paris Exhibition of the work in which they are now engaged. A separate building in the park is entirely devoted to this object. The country is represented by a large plan in relief, occupying one entire room of the building. Models are exhibited of the principal machines used in digging the canal. Specimens of the soil of the isthmus through the course of the canal, and different natural productions from it, are shown. To give a general idea of the progress already accomplished, a panorama of the Canal of Suez in the state it was in April, 1867, is exhibited.

The relief plan has been made from the best maps, under the direction of the engineers of the company. Entering from Europe, we first come on the canal at Port Said; here there is a double pier, the object of which is to serve as a shelter to ships, between its two walls, with a depth of water 10 metres. The pier on the west will be 3,000 metres long, and half has already been made. That on the east will not extend so far; its protection is less required, as winds rarely blow from the east on this shore; 1,800 metres are considered sufficient. The works are being pushed on in order that they may be finished before the end of next year. A whole fleet of merchant ships will be readily encompassed by its gigantic arms.

Stones are rare in the Isthmus, and the foundations of

the piers were commenced with stone brought from a quarry situated beyond Alexandria; this quarry was insufficient for the purpose, the expense of transport was great, the construction went on slowly, and was very costly, and its employment had, therefore, to be abandoned. Several very important hydraulic works elsewhere having been satisfactorily executed by means of artificial blocks, the Suez Canal Company have employed the contractors for those works to construct the piers of Port Said. These blocks are made of sand and lime from Theil; this mixture is moistened with water, and dried in moulds; two months under an Egyptian sun are sufficient to harden these blocks, and their subsequent immersion in water adds to their hardness. Each block weighs 25,000 kilogrammes. Steam cranes, with great levers of wood and iron, raise them up and put them in their places with the same ease that a mason lays a brick in a wall. The joints between the artificial blocks are filled in with small pebbles, which, assisted by the action of the sea, form a compact and solid mass. The piers, at their shore ends, are distant a space of 1,400 metres from each other, but gradually contract to an opening of 400 metres at their mouth. The triangle thus formed covers a large area of calm sea, where hundreds of ships ride in shelter, waiting for their turn of passing through the Isthmus. The construction of this breakwater will require 250,000 cubic metres of blocks. At the end of April, half of these had been submerged, and the work is proceeding steadily. Along the western pier a channel of 100 metres of breadth has been already excavated to the depth of 6 or 7 metres, and at the present time the large ships belonging to the Messageries Impériales anchor there.

Since the commencement of last June vessels coming and going could put in at Port Said. Having entered the port a vast parallelogram of ground appears, enclosing a surface of 36 hectares of water (about 90 acres). This great basin has four deep indentations which form secondary basins. On the west the basin of commerce, containing 4 hectares; the basin of the arsenal, 3 hectares; the basin of Four-à-Chaux, 5 hectares; and on the East the basin of the marine, 3 hectares: the total area of the port, including these basins, exceeds 51 hectares (or about 127 acres). In April, 1867, there remained to be raised 2,732,000 metres of earth, in order to excavate the port and basin of Port Said and form it to its full depth. Eight dredging machines are employed, and they each raise 1,200 metres per day, so that in ten or eleven months the work may be expected to be finished. Port Said is the first step towards the civilization of this country. It is only a few years since M. de Lesseps and his companions made their exploring visit into the Desert, where no human being up to that time had taken up his abode, and when the land now forming the site of Port Said was covered with the waters of Lake Menzaleh. A small strip of sand, of the breadth of 200 metres, formed the outline of the sea coast, a small barrier, beaten on the one side by the waves of the Mediterranean, on the other by the waters of the lake. No tree, nor even a blade of grass, grew there sufficient to shelter the sea birds. It was here that the first stroke of the spade was given to open the cutting destined to form a passage for navigation between Europe and Asia. By the side of this cutting habitations arose, at first humble and afterwards of a more ambitious character. By degrees the band of earth increased, and the produce of the excavation filled up the marsh, and so formed a foundation for the city. The excavated earth was employed for the embankment, and the soil by degrees rose above the water, and the lake was driven back. Wooden cottages, imported from France, were erected on it, and then followed houses in masonry, specially constructed for workshops and as residences for the employés; an hotel for travellers, shops nicely ornamented, a light-house, a chapel, and hospital succeeded. The residence of the employés and workmen gave rise to native speculation, fresh food was brought in from the interior.

and a market was established, which, though humble at first, was most useful. Thus was founded the first village in the isthmus. Port Saïd has now ten thousand inhabitants. It is described as an agreeable city, half industrial and half picturesque; its situation is charming. Large numbers of fishing boats ply their trade on the lake, producing, it is said, a return of half-a-million francs. The history of the rise of Port Saïd is the history of all the other towns and workshops on the isthmus. One may form a just idea of the rapidity of their foundation and the conditions of their growth by the preceding description. The canal, on leaving the port, traverses Lake Menzaleh. Formerly this lake and the surrounding marshes were cultivated plains, endowed with that Egyptian fruitfulness so celebrated in antiquity, and which ministered to the wants of the Romans. A branch of the Nile (the Tanitic branch) washed the walls of royal towns which have now disappeared beneath its waters; some bricks and pieces of pottery and rare statues in the Cairo and Boulac Museums are all that remain of that lost race—the gloomy and still water covers their dwellings. As far as the view extends on the east, to the west, and towards the south, in going from Port Saïd, a sheet of water is seen, here and there dotted with verdure, which formerly were firm hillocks of ground, but are now deserted islands.

The marsh extends a great distance to the right, towards Rosetta and Daimetta, celebrated for the misfortunes of Louis IX., the chief of the seventh Crusade; to the left it stretches to the Desert, and loses itself in the sand; towards the south it occupies half the space which separates the two seas. Embarked in one of the steam-boats, which perform the daily service with regularity, the traveller can observe the general configuration of the isthmus on the line of our navigation, that is to say, between Port Saïd and Suez. It is a depression of land towards which the two sea coasts formerly stretched. The waters of the Mediterranean had a tendency to join the Red Sea. One may suppose that the former entered the Lake Ballah, whilst the latter is generally allowed to have reached as far as the northern extremity of the Lac Amer. A barrier hindered their union, formed of two elevations of land, containing a basin of fresh water, peopled with crocodiles, called Lake Timsah. These two elevations, called El-Guisr and Sérapéum, have been cut through by the Canal Company. El-Guisr was the most elevated. It was 20 mètres above the water, and formed the obstacle on the Mediterranean side. Sérapéum was eight mètres high, but the mass prevented the passage of the waters of the Red Sea. El-Guisr was pierced chiefly by Egyptian fellahs. Sérapéum has been excavated by dredging machines, and the cuttings which traverse it will soon be lowered to the level of the canal.

To recapitulate. The canal of Port Saïd, up to the plateau of El-Guisr, passes through the great Lake Menzaleh, then the Lake Ballah, now without water. It passes across El-Guisr, meets Lake Timsah, then Sérapéum, another opening, which it clears in order to arrive at the incline turning towards the Red Sea, and the Lake Amer, and the Plain of Suez. The principal town, where the management of the Canal Company is carried on, is at the central point, by Timsah, between El-Guisr and Sérapéum, and is called Ismaïla, named after the Viceroy of Egypt. Port Saïd was named after his predecessor Mohammed Saïd Pacha, who gave great assistance in the formation of the Canal Company. Ismaïla is larger and more elegant than Port Saïd.

Port Saïd is specially the centre of the workshops of the Company. Dredging machines, boats, and engines of all kinds are built and repaired there. The cargoes of the ships are received there, to be forwarded and distributed in the isthmus. It is the principal seat of the operations for the transit of merchandise, which, coming from the Mediterranean, is carried from the Port of Suez to its destination in the extreme East. The great Steam Navigation Companies, the Russian Com-

pany of Odessa, the Messageries Imperiales, and the Marseilles packet-boats, send their vessels there.

The general manager of the works lives at Ismaïla; all the offices are grouped round him. The president of the company also resides there. His presence has tended much to raise the tone of the workmen in these isolated workshops, where some hundreds of men live, grouped as shipwrecked sailors, upon a rock, in the midst of an ocean of sand. He is popular and respected, and possesses those qualities which command obedience.

M. Borel and M. Lavailley, the contractors of the Suez Canal, are men of experience. They have carried on the management of the works at Ismaïla, but for the accommodation of the service they have just removed. The Government of the Viceroy is represented at Ismaïla by an Egyptian functionary; he inhabits the finest building in the town, erected from the plans of a former engineer of the company, now the director of bridges and highways in the Egyptian service, M. Sciamia Bey. A few years since, the Lake Timsah was a basin without water, in which grew bunches of rushes burnt up by the sun; it now presents the pleasing aspect of a vast sheet of water. Ismaïla was a hillock of sand, as naked and sterile as it is possible to imagine; now it is fertile and well-peopled. Fresh water is sent from thence to Port Saïd, eighty kilometres distant, by steam force-pumps. Two months since an Austrian ship—the first which passed the canal from Port Saïd on her way to Suez—by chance her name was *Primo*—put in at Ismaïla. The crews landed there and collected enormous bouquets, for already flowers are numerous there. Two days after they entered, by means of the fresh-water canal, Suez, ornamented with fresh garlands of natural flowers. The desert is, indeed, changed, under the industrious band of the Suez Company, with the help of the two principal fertilisers of Egypt, water and sun. Timsah is situated where the maritime canal meets the fresh-water canal. On the plan in relief is seen a strip of verdure marking the course of the fresh-water canal, which, starting from the banks of the Nile, advances through the sands towards the isthmus. It is the land of Goshen, mentioned in the Bible where Jacob and his sons, summoned by Joseph, established pasturages in the land. It is from thence that the great emigration of Jews, led by Moses, started. Its history, related in the Holy Scriptures, can even now be followed step by step. The company has excavated in this valley the bed of a canal which connects Lake Timsah with one of the branches of the Nile, still bearing the name of Moses, in remembrance of the great Hebrew legislator who was exposed there; this is what is called the fresh-water canal, and which runs in a straight line to Timsah, and after arriving at this point, turns to the south and descends parallel with the maritime canal as far as Suez, where it falls into the live sea. In passing, it waters and supplies Ismaïla; its breadth is about 15 mètres by 2 deep. By this way the company have for some time conveyed to the isthmus grain, provisions, materials, and travellers. The water which serves it there supplies the yards and population. This canal serves for the conveyance of merchandise, either from Suez or Port Saïd, until the maritime canal is open and free from one sea to another. The greater part of the maritime canal, which extends from Ismaïla to Suez, will be occupied by a basin of great extent; here are the Lakes Amer. The waters of the Mediterranean and the Red Sea will fill it when the approaches on the north and south sides are completed. At these two extremities the earth is studded with rocks, the extraction of which occasions expense and trouble. It is most probable that the Red Sea has penetrated to these lakes at a remote epoch, for at the depth of several mètres salt deposits are found. A specimen of this substance, carved in the form of a column, has been placed at the entrance of the Suez collection in the Paris Exhibition. It only imperfectly shows the thickness of the saline bed,

which is, besides, covered in several places with mud half dry. This part is dangerous. One of the employes nearly lost his life there; he was submerged as far as his waist for 24 hours, keeping himself up by means of a plank, in great danger, till he was rescued. The Lakes Amer, which will contain 900 million mètres of water, will form an inland sea where ships will be exposed to the action of the winds and the agitation of the waves, but the company will take care to establish the necessary works to assure the security of the navigation. It is however more than doubtful if these precautions may not be unnecessary; in the mean time it is expected that the great mass of waters contained in these lakes will balance the waters of the Red Sea on one side, and the currents produced on the other side in the Canal by the winds of the North-West, which prevail during one part of the year. This fortunate disposition of nature renders unnecessary the construction of locks, which would have impeded navigation in the maritime canal. The Suez Canal, 100 mètres wide at the water-line and 8 mètres deep, will form a kind of Bosphorus, or, according to the comparison of the late Robert Stephenson, expand like a gigantic ditch, since in its excavation 60 to 70 millions cubic mètres of earth will be raised.

(To be continued.)

SMOKE CONSUMPTION IN THE POTTERIES.

The *Staffordshire Sentinel* writes thus:—

The smoke consuming clauses of the Sanitary Act, 1866, were fully explained in the *Sentinel*, when first the Act passed. We then stated that the law would come into operation in the month of August, 1867. The interval of upwards of twelve months was very properly allowed, so as to give time to manufacturers to adapt their processes of burning coal to the provisions of the law. The time thus allowed was ample, and in some towns the greatest known improvements in the combustion of coal have in the meantime been adopted by manufacturers, to the great abatement of an intolerable nuisance, and a not less saving of money; and the local authorities, with a view to giving practical effect to the law, have appointed smoke-suppression committees and salaried inspectors of the smoke nuisance. No manufactures are so prolific in the generation of smoke as those of pots and iron. In the Pottery towns both these manufactures are carried on to an immense extent, so that the smoke nuisance prevails there to a greater extent than in any part of the kingdom. The Potteries are consequently a dark and dingy district, in which the bluest skies are constantly overcast with gloom, where cleanliness is absolutely impossible, and where no man can breathe without inhaling coal smoke to a greater or less extent. To the Potteries, therefore, more than to any other part of these islands, the Sanitary Act, 1866, is a boon; and in these towns, above all others, obedience to the new and wholesome law is required by public economy and public health. If, therefore, efforts should be anywhere made to bring the statute into practical operation, it should be there. The local authorities of the district might have been expected to evince a commendable activity to ensure universal obedience, and the manufacturers to vie with each other in the adoption of the greatest improvements in the consumption of smoke. What, then, has been done? The local authorities, accustomed as they always have been to a most polluted atmosphere and to murky skies, have been about as serenely indifferent as if the skies were of Italian azure, and the air as pure as that on mountain tops. Town Councils and Improvement Commissioners have been as inactive in the matter as though they were non-existent; and as for the Chamber of Commerce it has done absolutely nothing. In all other trades, chambers of commerce take the lead in every amelioration which the staple manufactures share in common, and innumerable public advantages are monuments of their

usefulness; but that of the Potteries is like a body, which only occasionally, and at long intervals, gives signs of life. It so seldom speaks, and so rarely acts, that its voice and its acts might be supposed those of a somnambulist. Its meetings, too, instead of other Chambers of Commerce, are held almost private.

An attempt has been made to consume the firing of pottery wares, by Messrs. Holdcroft and of Sandyford, Tunstall. Their plan has been adopted by several manufacturers in Hanley, Fenton, and Sandyford, and other places, and it consists in a tube in the centre of the oven, down which, instead of escaping at the top, all the smoke and other volatiles of coal fire are forced by a downward draught caused by a subterranean connection with a chimney adjacent. But this is done during a part of the firing process. Our *Staffordshire Sentinel*, on the 8th instant, states that this simple process prevails, and nuisance in a surprising degree, that the escape of smoke and heat is to a great extent prevented, that smoke is mostly consumed in the downward draught, that there is a consequent saving of from three to four tons of coal per oven, and that the loss by saggers is reduced by one-third. Now every intelligent student of natural philosophy must know, that a mere downward draught cannot possibly so increase the process of combustion as to prevent the escape of smoke to a surprising degree. Every practical man knows, as a matter of fact, that these details of the alleged results of the downward draught are a series of exaggerations. The downward draught, as adopted in the ovens of the above nature, has just one main result, viz., that it prevents the presence of the escaping heat, by forcing it into a central tube in the oven, and along a horizontal duct under the oven, before allowing it to depart through the chimney; and by thus bringing the draught under the oven floor the lower part of the oven, which by the common process is the last to be heated, is made hot. This is all that it does, but that little is important, the heating process is thus made more equal over the oven, and consequently the wares at the bottom are more quickly fired, and thus there is a saving of coal. But the coal saved per biscuit oven is not from three to four tons, as stated, it is about two tons only. The smoke is indeed diminished, but not so much by more perfect combustion as by the diminished consumption of coal. The diminution of smoke is simply owing to the saving of the smoke of the two tons of coal that are saved, and as heat is brought to the bottom, the usual excess of heat during the usual time, so destructive to saggers at the top, is diminished. Such are in truth the very moderate advantages of the new plan so exaggerated by the contemporary. But still the smoke of the oven is not consumed, as is testified by the dense volumes of the elements which are seen to leave the chimneys and receive the downward draughts of the ovens.

Many alleged improvements in the firing of the pottery ovens have been from time to time invented, some of which have been patented, but several of the most recent have been ridiculous, and all have been more or less failures. The experiments connected with them have been so costly, several of them have been so ruinous, and all of them so ineffectual, that the possibility of using coal as fuel the prodigious quantity of smoke given out by a biscuit oven is commonly regarded as hopeless. It is nothing is impossible that is not unnatural. It is not ignorance or indolence that despairs. To assume that it is an enormous waste of most valuable fuel, and so fatal a nuisance as that which pollutes our breath, and covers us like a funeral pall, cannot be prevented, were it to reflect upon the capacities of nature, and upon those whose modern marvels past ages would have accounted miracles, and whose present state is but the infancy of its future. As in human affairs one thing leads to another, and a second step in progress is frequently

no man expected to rise from the first, it may be that pottery ovens may eventually find their model in the unique kiln, which for a very different purpose is being built at Longton. The brick is in itself the best and most primitive of all manufactures, however useful in power and in quickness of action may be the machine by which it is made; and the artistic forms of the skilled modeller has produced, and which the work of the engraver, the painter, and the gilder have added, are things of beauty, which are a joy for ever; the simple body of clay in the rude quadrangular and the very composite body of clay in the form of the beautiful as the offspring of Nature, are created by the same identical process. In both cases the plastic element, which in the human hand assumes any form that is given to it, is made hard as rock. The hardening of the coarser object by the new process is perfect, and in that process the expenditure of fuel is reduced in the proportion of from seven or eight to one, every particle of smoke is so consumed that the smoke from a chimney is so invisible as scarcely to indicate the presence of fire, and consequently an immense saving of fuel is effected, and a great nuisance is completely suppressed. This process, which will be shortly in operation in Longton, is in other places a proved success in relation to the coarser manufacture, may it not by well-considered adaptations, become as completely successful in relation to the finer objects of human art? The reader again examine that process, as described in our last issue, and he may perhaps coincide with us, with others, practical men, in the opinion that the abilities of success in firing earthenware and porcelain by the new process adopted in burning bricks, are great as to make the experiment not merely expedient but a public duty. It may be wise not to be too sanguine for so many and signal failures, but the new idea is in line with all the elements of hope, and there are men of great practical experience, and who are not given to fancy, who at present fail to discover any reason for doubt. Should this prove to be the solution of the most perplexing of all pottery problems, it will afford us profound satisfaction to have been the means of promoting it.

And in that case, since the consumption of smoke created by the fires of steam boilers and of slip-kilns is an easy process, which yields an ample return upon the outlay, and since iron furnaces may be fed with coke, there will be some hope of the potteries obtaining clearer air and brighter skies than have been ever known to their present inhabitants. At all events we trust that the experiment, under the most favourable conditions, will be made as early as possible.

Smoke can be consumed in every manufacture, as is proved by innumerable facts, and what can be done ought to be done. It is consumed almost everywhere, and ought to be consumed here. In Mr. Doulton's pottery kilns, Lambeth, smoke is completely prevented by mechanical contrivances, so that though his works are at first specially exempted by enactment, he has effected the removal of the exemption, and voluntarily subjected himself to the law. However heavily charged with fuel his fires may be, there is no escape of smoke. The large iron district of Middlesborough, where furnaces and various ironworks abound, is an almost smokeless region. In London there is a Smoke Prevention Department of Police, and by rigorous supervision the smoke of every furnace is constantly suppressed. The nuisance is not merely mitigated, but is in every instance absolutely prevented. The breweries, the ironworks, the marble works, the largest bakeries, the saw mills, the vast coke ovens, the fires of the Bank of England and of the Royal Mint, and works in which refuse of all kinds, wet shavings, and the commonest slack are used as fuel, all are quite free from smoke. In Leicester the work of smoke prevention is devolved upon the Borough Surveyor and the police, and it is thoroughly done. In Bradford the Town Council has taken prompt and

effective measures to suppress smoke in every branch of trade, and with complete success; and in a report of the Smoke Nuisance Committee recently made, and which now lies before us, it is stated, as the result of many trials, and of observations in various parts of the kingdom, that "smoke can be completely prevented with advantage to the owner, and that this can be done with any kind of fuel, and in every description of work or manufacture." Where the law has been enforced, it is now obeyed spontaneously. Manufacturers have been required to consume their own smoke from public considerations, but they now consume it as a saving of money. The more smoke they burn, the less fuel they have to buy. From time immemorial they have thoughtlessly and ignorantly been allowing excellent fuel to escape, to deform, to defile, and almost to poison, every animal and vegetable form of life around them; but they have been compelled to learn the lesson which teaches how to detain the vagrant element at home, and to convert a mischievous enemy into a most useful friend. What they first did as a duty they now do as an act of economy. They turn smoke into gold. In this case, as in every other, self-interest is identified with public duty, and manufacturers who find smoke so lucrative an element in their own furnaces, will never more be so extravagant and so unjust as to send it forth to annoy the eyes and lungs of their neighbours, to fill the streets and houses with noxious exhalations, and to spread gloom, dirt, and barrenness over the adjacent gardens and fields.

The work of smoke prevention must be done, and if the local authorities show themselves, by inaction, to be incompetent, the interposition of the Government will be most certainly invoked and obtained. The law is not a permissive one. The requisitions are imperative, and leave no option to incompetence, negligence, or hostility. The local authorities are the best and most proper executives of the law. If they carry it into effect there will be no interference with their legitimate functions, and no needless expense will be incurred, but if they do not, a public officer will be unquestionably appointed, whose salary and whose expenses will be paid from the local rates, and who, from his less practical acquaintance with our staple trades, may show less consideration than neighbours, as men of business, may show to each other.

There are many methods of consuming smoke, any one of which is better than none, and in the event of complaint being made the justices may, without appeal, order the nuisance to be suppressed, and in default the owner or occupier is liable to the daily penalty of 20s. And it will be well for town councils and commissioners to note that by section 16 of the Sanitary Act, about to come into operation, the Secretary of State is empowered, on proof that default has been made by the local authority in "doing its duty," to authorise the chief police officer to enforce the law, the effect of which will be to make the police officer paramount to the authority which practically abdicates its office; and by section 49, the Secretary of State is also empowered, on complaint by any one, and proof that the local authority has made default in enforcing the provisions of the Nuisances Removal Act, to order the local authority to perform its duty, and, if not complied with, to appoint any person to perform it, and to direct that all expenses be paid by the local authority, together with such reasonable remuneration to the person appointed as the Secretary of State may determine. It is therefore very clear that unless the local governing bodies very promptly and effectually set about the work of giving effect to the law their authority will lapse, they will be deservedly treated as nonentities, and a Government nominee will appear amongst us, armed in his own person with full powers to carry out the law. Our local authorities must consequently very quickly make their choice, either to undertake the wholesome and salutary work of suppressing a great and most

costly nuisance, or to see themselves ignored, and the work done by a salaried stranger, all of whose costs they will undoubtedly have to pay.

Fine Arts.

IMPERIAL GRAND PRIZE IN FINE ARTS.—The Paris Academy of the Beaux Arts, or rather the five academies of the Institut of France, have awarded the Emperor's grand prize of 20,000 francs to M. Felicien David, the composer. This prize is awarded alternately in the several faculties of the Institut.

Manufactures.

MULHOUSE SOCIETY FOR PREVENTION OF ACCIDENTS IN FACTORIES.—The idea of an association, having for its object the prevention of accidents in factories in which steam is employed, is likely to be carried into practical operation in France. Twenty-two manufacturers of Mulhouse and its vicinity have met and subscribed the sum of 7,000 francs. These gentlemen employ nearly half a million of spindles, 3,340 power-looms, and 82 steam-printing machines. The Association proposes to act in various ways—by combined action and arrangement, by the communication of the best methods of preventing accidents, and by the appointment of a salaried inspector, whose duty it will be to visit all the establishments in company with the proprietors, or of some one appointed by them, and to confine his observation strictly to the one object in view. The inspector is to note all his observations in a register, and to leave a copy with the manufacturer; and he will take note of all accidents, and draw up a report from the accounts given him by manufacturers, managers, and workpeople, and he will also make an annual report to the Association. The subscription is fixed for the first year at 10frs. per 100 spindles, 25 centimes for each power-loom, and 20frs. for each steam cylinder-printing machine. The Association intends also to collect, as soon as possible, the materials for a manual for the use of overseers, foremen, and workmen, informing them of the principal precautions to be taken, and the arrangements to be made to prevent accidents of all kinds. This Association is worthy of the men of Mulhouse, who have done so much for working men by the establishment of schools, industrial societies, and economic residences.

Commerce.

THE COTTON TRADE.—Messrs. George Fraser and Co.'s circular, dated Sept. 2nd, says:—"The business in our market during the month just ended has been of a highly unsatisfactory and of very disheartening character. There appears to be a general want of confidence, and, in consequence, increased difficulty in moving off the present comparatively large production of yarns and goods. Spinners and manufacturers being unwilling, as a rule, to go into stock, continue to force sales at the best prices practicable, as they seem disinclined so far to adopt the more salutary course of closing their mills or working "short time." Thus, while there has been no decline in the price of American cotton at Liverpool, $\frac{1}{2}$ d. per lb. only in that of Pernams, $\frac{1}{2}$ d. per lb. in that of Bombay and Bengal cottons, and $\frac{1}{4}$ d. per lb. in that of Egyptians, previously unduly high, yarns have declined from $\frac{1}{2}$ d. to $\frac{1}{4}$ d. per lb., and goods still more in proportion. The position of the trade has consequently changed materially for the worse, and every day it be-

comes increasingly evident that an extensive "short time" is imperative if prices are to be maintained at even their present comparatively low level. Further proof of this we have only to glance at the position of the leading India markets. They are ready over supplied with goods, and with new shipments on the way, so that the latest prices, revised by telegraph do not cover the low prices receded to on this side. From China the accounts are much more favourable, and show fair profits, but a stream of shipments is now being directed thitherward to India, it is to be feared that a similar panic will be exhibited there also at no distant day. The trade continues very inert, but more perhaps on the general want of confidence than from any other cause, as the very splendid weather we have had has enabled great progress to be made with the work. Thus as the American and Canadian harvests last year have also been very fine and abundant, we may expect a gradual return to a lower price of food from abroad, which is the most important element of all in the balance of the prospects of our home trade. But, also, it may be expected to be favourably affected by the great increase of money, and by the rise in the value of real property, and the gradual, albeit slow, and at times uncertain, restoration of confidence in such and in other investments. We look, therefore, to a gradual and a revival, ere long, in the home trade. There is no new bearing upon the future supply of cotton. The weather in America appears to have been propitious to the growing crops, and countenances the expectation of a yield of $2\frac{1}{2}$ millions of bales or over. But nothing like definite estimates are premature, and can fairly be formed when the first killing frost takes place. They will probably reach us towards November or December, when also the prospects for the harvest in Turkey, Egypt, and Brazil supplies may be to some extent estimated, and a notion be formed of the supply for the following year."

Colonies.

STATE OF VICTORIA.—This colony is now exporting large quantities of wheat to England. Some squatters are making preparations to boil down sheep for tallow, in absence of a market for the bread is selling at from 6d. to 6d. the 4 lb. loaf, and mutton from 3d. to 6d. per pound; potatoes £3 per ton; and excellent wine, of colonial growth from 4s. to 5s. per gallon. Local production of that concerns a supply of the necessities of life considerably in excess of local consumption, and the progress of the colony is literally arrested by the immigration. These facts cannot be repeated too often, nor impressed too strongly upon the minds of our countrymen at home. The population of this colony is now by hundreds of thousands only, while the continent is capable of maintaining millions, with a wide field for the enterprise of the restless and the adventurous of the neighbouring colonies, and in the inner islands of the Pacific. What a mere handful of people has accomplished in Victoria chiefly since the year 1851, may be accepted as an earnest of what may be effected by still larger numbers, actuated by the spirit of industry and energy, in the time to come. They have built and conferred municipal institutions upon upwards of 60 cities and towns, containing 700 habitable dwellings, more than 300,000 souls, and a considerable property of the estimated value of £20,000,000. Outside of their limits are the rural shires and districts to the number of 100, with 54,000 houses, 253,000 inhabitants, and rateable property amounting to £16,000,000 in value. For the spiritual wants of the people 1,700 churches and chapels have been erected, and for the education of the young upwards of 700 schools

schools have been opened, upon the rolls of which the names of 70,000 children are inscribed. Some of the most important towns of the colony are brought into direct communication with the seaboard by 271 miles of railway and 3,000 miles of telegraphic wire; and 525 post-offices furnish the colonist with every requisite facility for the transmission of his correspondence. Pastoral and agricultural pursuits provide employment for 55,000 men and women, mining for 80,000 men; and 900 mills and manufactories afford occupation to nearly 10,000 persons, exclusive of several thousands who are engaged in various handicrafts in Melbourne and other large towns. It is calculated that every man, woman, and child in Victoria annually consumes manufactured articles, the produce of the United Kingdom, of the value of about £12, while the imports from other British possessions are equivalent in value to £6 per head of our population. And since there are branches of manufacturing industry which can only be successfully prosecuted in countries possessing cheap capital, cheap labour, great mineral wealth, and matchless means of intercommunication like England, it follows that the supplies of certain articles of general consumption will continue to be drawn from thence for many years to come, and that, therefore, the growth of colonial population by immigration implies the extension of one of the largest and best markets to which the parent state directs her commerce. The following statement shows the population of the colony of Victoria for the last 10 years:—In 1857, 463,136 persons; in 1858, 504,519 persons; in 1859, 530,262 persons; in 1860, 537,847 persons; in 1861, 541,800 persons; in 1862, 555,744 persons; in 1863, 574,331 persons; in 1864, 605,501 persons; in 1865, 626,639 persons; in 1866, 643,912 persons. The population of the gold fields gives a gross total of 257,264, or about three-sevenths of the population of the country. Of these 70,794 are miners, of which 20,134 are Chinese, and 50,660 Europeans.

SYDNEY SQUATTING.—Notwithstanding the losses which the squatters of Riverina have sustained latterly, they have been expending large sums of money in improving their runs. On every run from Dubbo to the Warrigoo, and from the Queensland border to the Lower Barwon, dams have been erected, wells sunk, and large areas fenced in. Vast quantities of new country have also been taken up in the far west, and the flocks and herds of the squatters are now to be found almost in the very heart of the Australian continent. In those parts of the country most subject to droughts, wells have been sunk at a very great expense, and are capable of watering from 10,000 to 50,000 sheep; it is not, therefore, very probable that there will be any want of water this summer, and added to these efforts of the squatters themselves, the government, it is said, intend to lock the Murrumbidgee somewhere below the Yakoo Cutting, and thus store up an immense quantity of water. The cost of this enterprise will be about £50,000. The government will supply the water to those requiring it at a very low rate. Stock generally throughout the country is in good condition. Some valuable cattle have been imported lately in large numbers, and the improvements which have taken place in the breeding of colonial stock for some time past will doubtless continue.

PROGRESS OF SOUTH AUSTRALIA.—Returns show that the combined export and import trade rose from £3,000,000 to £6,000,000 during the ten years ended 1865; that in the same period the exports of produce increased from one and a quarter million to two and three-quarters; and that between 1858 and 1865 the area of land under cultivation rose from 264,000 acres to 660,000 acres. In no other colony, in fact, could so small a population, 160,000, point to more substantial proofs of prosperity. The amount of taxation paid through the Custom-house in this colony, during 1865-6, was 30s. per head; in New South Wales, 40s. per head; in Victoria, 32s.; and in Queensland, 76s. per head. In the matter of the bonded debt

the comparison is still more striking. South Australia, with a population of 165,934 souls, owed at the close of 1866, \$751,600, or \$4 10s. per head, whilst for the other colonies the returns were as follows:—

	Population.	Debt.	Per head.
New South Wales	421,000 ..	\$5,638,530 ..	£13 8s.
Victoria	632,998 ..	8,733,445 ..	13 16s.
Queensland	95,100 ..	3,021,186 ..	31 16s.

These figures show that if there ever was a colony that ought to prosper South Australia is the one.

MELBOURNE.—The value of the imports and exports at the port of Melbourne, for the present year, to June 22, is as follows:—Imports, in 1866, £6,497,305; in 1867, £5,572,348. Exports, 1867, £5,407,536; 1866, £5,179,046, showing a decrease in the value of the imports of £924,957, but an increase of £228,491 in the exports. The following is a statement of the revenue of the Victorian railways for the month of April, 1867:—

Lines.	Passengers, Horses, &c.		Goods.		Total Revenue.	
	£	s. d.	£	s. d.	£	s. d.
Murray River	8,889	9 11	14,032	10 9	22,921	19 10
Williamstown	1,150	6 9	1,715	7 3	2,865	14 0
Ballarat	7,460	15 1	8,391	10 6	15,852	5 7
Total ..	17,500	10 11	24,139	8 6	41,639	19 5

The total number of passengers on each line was:—

Murray River line	18,733
Williamstown line	43,069
Ballarat line	14,077
	76,879.

The total amount of receipts from the commencement of the year 1867 to 20th June, amounted to £247,145 7s. 6d., showing a weekly average of £10,087 11s. 4d. The revenue, from the commencement of the year to 20th June, on the Melbourne line and Hobson's Bay Company railway, was £595,590 17s. 6d., averaging £2,439 7s. 6d. weekly.

Obituary.

DR. VELPEAU, one of the most eminent surgeons that France has produced, expired suddenly in Paris last week, at the age of 73. Dr. Velpeau was the son of a farmer, of the village of Brèche, in the department of the Indre and Loire, and self-taught even as regarded the very elements of education. He afterwards studied at Tours and came to Paris, where he obtained his full degree in 1823, and a few years later was elected member of the Academy of Medicine, and afterwards of the Institut. Dr. Velpeau also published a number of important works on operative surgery, embryology, and anatomy.

Notes.

PARIS EXHIBITION JURY AWARDS.—The Abbé Moigno, in the French scientific journal *Les Mondes*, thus characterises the decisions of the juries:—"No judgments have ever been received with less favour than those of the juries of the Exposition Universelle of 1867. How can we say a word in their favour when we are met on all sides with strong protests and angry accusations, when everywhere the words incapacity, partiality, injustice, &c., are freely made use of. The members of the jury were of the highest position, but they were hurried, were overworked, and bewildered; no time was given them for arriving at a sound de-

cision, it was an absolute impossibility for them to establish a real competition between the parties, to make on the spot those trials which alone can conscientiously justify the exercise of the judgment. Ill supplied with information, they have yielded to the influence of high sounding names, personal sympathy, blind friendship, and the claims of interest; the first have become last and the last first; mediocrity has carried off the great rewards of gold and silver medals, and even the Cross of the Legion of Honour; real and admitted merit has been reduced to a bronze medal, honourable mention, and even passed over in silence."

PARTIAL DESTRUCTION OF THE CHURCH OF SAN GIOVANNI E PAOLO IN VENICE.—A portion of this celebrated edifice, which was commenced in the beginning of the thirteenth century, and contains the tombs of the Doges, has been destroyed by fire; a fine work by Titian, "The Martyrdom of St. Peter," was consumed.

SUBMARINE TELESCOPE.—A new instrument with the above name, which may be of considerable service, was tried the other day in the St. Martin's Canal, in Paris; no description is given of it, but it is probably an application of the principle of the surgical mirror. One end of the instrument is placed near to the hull of a vessel or any submerged object that is to be examined, while the eye of the observer is placed at the other end, which remains above water; the experiment is reported to have succeeded so well that pencil marks made on a sheet of paper were distinctly visible at a depth of about five feet below the surface of the water. There is no doubt that an instrument which would allow of instant examination of the hull of a vessel might be of great service, but of course any motion in the water would seriously affect its application.

THE NEW OPERA-HOUSE OF PARIS.—The exterior of the great new opera-house of Paris, or, to use its official designation, Academy of Music, was cleared of scaffolding and thrown open to public view previous to the day of the Imperial *fêtes*, the 15th ult. The ornamental portions are not yet entirely finished, but the work presents an interesting example of the kind of decorative architecture now in vogue; the general surface of the building is relieved by the introduction of marble columns and pannels, inscriptions in gold or coloured marble grounds, and gilt busts; the main lines of the building and the architecture, both of the front and side porticoes, are capped with bronze ornaments; that which crowns the parapet of the main face being gilt. The outline of the parapet of the front of the edifice is straight, but the two ends are to be surmounted by bronze groups, which are represented at present by painted substitutes. Crowds of observers are to be seen every hour of the day, contemplating the new monument of Paris, and criticising the work of the architect, M. Garnier.

Patents.

From Commissioners of Patents' Journal, August 30th.

GRANTS OF PROVISIONAL PROTECTION.

Animals, removing wool or hair of—2386—H. Cridland.
Bakers' ovens, heating—2348—J. Coggrave.
Bale ties—2353—W. R. Lake.
Bed, couch, and chair combined—2338—C. F. Bower.
Bollers, preventing incrustations in—2294—H. A. Avery and G. Penabert.
Bottle racks—2384—W. Burrow.
Brewers' worts and beer, cooling—2330—C. E. Flower.
Cabs, &c.—2355—J. Day and W. Dorber.
Cages used in mine shafts, &c.—2144—J. Marley.

Journal of the Society of Arts.

FRIDAY, SEPTEMBER 13, 1867.

Announcements by the Council.

ARTIZANS' VISITS TO PARIS.

Her Majesty's Government have transmitted to the Society of Arts, in aid of the fund raised by the Society for assisting workmen, specially selected from various trades, to visit and report on the Paris Exhibition, the sum of £500, which was granted conditionally on the Society raising a like amount by public subscription.

The amount received up to the present time is as follows:—

H.R.H. THE PRINCE OF WALES,			
President	£31	10	0
Society of Arts	105	0	0
Other Subscriptions	382	4	0
} £518 14 0			
HER MAJESTY'S GOVERNMENT.. ..	500	0	0
Total	£1,018	14	0

Subscriptions may be forwarded to the Financial Officer, at the Society's House.

The following workmen have already been selected, and many of them are now in Paris:—

Proceedings of the Society.

FOOD COMMITTEE.

The following on the preservation of meat by means of ice, appears in a leader in the *Daily Telegraph* of the 9th Sept. :—

" Before the cattle plague 'o'ercame us like a summer cloud,' and struck down the very flower of our flocks, the British public frequently agitated the question how best to preserve fresh meat imported from abroad, and so utilise the vast herds of South American pampas and the countless sheep on Australian 'runs.' The discussion is at least half-a-dozen years old, but no progress has yet been made. Meanwhile Brother Jonathan, who said nothing whatever on the subject, was quietly making up his mind, and while we talked he acted. He has, apparently, solved the problem in a most natural and simple way, and it is perfectly amazing that the idea should not yet have been practically tested in England. The Americans have only done what every London fish-monger does with his salmon. We are informed that a car, specially prepared for the transportation of fresh

meat over long distances, is now running between Ohio and New York, and the preserving agent is ice, applied in large masses. By an ingenious contrivance, a current of air passes through the car from end to end; it is thus constantly renewed, and is always iced. The meat, being kept in a sort of Arctic temperature, remains perfectly free from even an approach to decay. Hence we are not at all surprised to learn, that when the refrigerating car had reached New York, at the end of four days' journey, its cargo of 16 steers and 123 sheep was as fresh as when killed. We are not told whether the flavour of the meat was preserved. The essential point is that a mode has now been discovered by which fresh-killed beef and mutton can be preserved for an indefinite period; the sole condition of success being an ample stock of ice. Science, which has already done so much, will certainly supply us with ice for the asking. We have thus the prospect of being able to secure importations of fresh meat from distances hitherto unattainable. If it can be kept for four days, it can, with due precautions, for forty, and that period would more than cover the gap between hungry Britain, with its many mouths, and the countries on the Plata, with their infinite resources. Let us trust that science and capital combined will some day bridge over the gap."

Proceedings of Institutions.

YORKSHIRE UNION.—At a special meeting of the Central Council of the Yorkshire Union of Mechanics' Institutions, Mr. E. Baines, M.P., president, in the chair, it was unanimously resolved to institute an inquiry into the present means for the promotion of scientific and art education in Yorkshire, and to ascertain the opinion of the principal manufacturers and others as to what measures are required to increase and extend the means for the technical instruction of the managers and foremen of manufacturing establishments, as well as the more rudimentary scientific education of artisans. Among the instructions given by the president to Mr. Henry H. Sales, who is charged with the inquiry, are the following:—You will inquire chiefly into the instruction given in the classes of the several Institutions under these heads:—1. Design, and mechanical drawing. 2. Mathematics, especially as applied to mechanical art. 3. The principles of mechanics. 4. Chemistry, especially as applied to dyeing. You will learn distinctly whether the gentlemen whom you consult are of opinion that Mechanics' Institutions are calculated, if properly used, to effect the object in view, or whether it is essential to have some institution of a higher class, exclusively designed for scientific and art education, and supported partly (and to what extent) by the public funds. You must also endeavour to judge how far our artisans would avail themselves of the opportunities for technical education, if offered, and whether, if evening classes be insufficient, we must look to the means of supporting students during their period of study. You will also try to ascertain if it is thought that one central school would suffice for the West Riding, and whether it should be at Leeds; and then, whether the scientific classes of our Institutes should be maintained as preparatory to the higher school or college, and with certificates or exhibitions entitling the successful candidates to be admitted to the higher schools.

EXAMINATION PAPERS, 1867.

The following are the Examination papers set in the various subjects at the Final Examination held in April last:—

(Continued from page 649.)

GERMAN.

THREE HOURS ALLOWED.

Each candidate is expected to translate one of the extracts in Section I., to answer four of the questions in Section

II., and to turn into German twelve of the sentences given in Section III. Candidates for a First Class must translate two pieces in Section I., one prose, the other poetry; answer (e), (f), and (g) of Section II.; render into German 17-20 inclusive of Section III., and work out the whole of Section IV.:—

SECTION I.

1. Mitten unter Verwundeten und Todten warf Gustav Adolph sich nieder, und die erste feurigste Siegesfreude ergoss sich in einem glühenden Gebete. Den flüchtigen Feind liesz er, so weit das tiefe Dunkel der Nacht es verstattete, durch seine Reiterei verfolgen. Das Gekläte der Sturmglocken brachte in allen umliegenden Dörfern das Landvolk in Bewegung, und verloren war der Unglückliche, der dem ergrimten Bauer in die Hände fiel. Mit dem übrigen Heere lagerte sich der König zwischen dem Schlachtfeld und Leipzig, da es nicht möglich war, die Stadt noch in derselben Nacht anzugreifen. Siebentaussend waren von den Feinden auf dem Platze geblieben, über fünftausend theils gefangen, theils verwundet. Ihre ganze Artillerie, ihr ganzes Lager war erobert, über hundert Fahnen und Standarten erbeutet. Von den Sachsen wurden zweitaussend, von den Schweden nicht über siebenhundert vermiszt. Die Niederlage der Kaiserlichen war so gross, dass Tilly auf seiner Flucht nach Halle und Halberstadt nicht über sechshundert Mann, Pappenheim nicht über vierhundert zusammenbringen konnte. So schnell war dieses furchtbare Heer zergangen, welches noch kürzlich ganz Italien und Deutschland in Schrecken gesetzt hatte.

2. Wie, Sire, ist das die Sprache eines Königs? Gibt man so eine Krone auf? Es setzt Der Schlechteste seines Volkes Gut und Blut An seine Meinung, seinen Hass und Liebe; Partei wird Alles, wenn das blut'ge Zeichen Des Bürgerkrieges ausgehangen ist. Der Ackersmann verlässt den Pflug, das Weib Den Rocken, Kinder, Greise waffnen sich, Der Bürger zündet seine Stadt, der Landmann Mit eignen Händen seine Saaten an, Um dir zu schaden oder wohl zu thun Und seines Herzens Willen zu behaupten. Nichts schont er selber und erwartet sich Nicht Schonung, wenn die Ehre ruft, wenn er Für seine Götter oder Götzen kämpft. Drum weg mit diesem weichlichen Mitleiden, Das einer Königsbrust nicht ziemt.—Lass du Den Krieg ausrasen, wie er anfangen. Du hast ihn nicht leichtsinnig selbst entflammt. Für seinen König muaz das Volk sich opfern, Das ist das Schicksal und Gesetz der Welt. Der Franke weisz es nicht und will's nicht ändern. Nichtswürdig ist die Nation, die nicht Ihr Alles freudig setzt an ihre Ehre.

3. Des Atreus alt'ster Sohn war Agamemnon: Er ist mein Vater. Doch ich darf es sagen, In ihm hab' ich seit meiner ersten Zeit Ein Muster des vollkommenen Manns gesehn. Ihm brachte Klytännestra mich, den Erstling Der Liebe, dann Elekten. Ruhig herrschte Der König, und es war dem Hause Tantals Die lang' entbehrte Rast gewährt. Allein Es mangelte dem Glück der Eltern noch Ein Sohn, und kaum war dieser Wunsch erfüllt Dass zwischen Schwestern nun Orest Der Liebling wuchs, als neues Uebel schon Dem sichern Hause zubereitet war. Der Ruf des Krieges ist zu euch gekommen, Der, um den Raub der schönsten Frau zu rächen, Die ganze Macht der Fürsten Griechenlands Um Trojens Mauern lagerte. Ob sie Die Stadt genommen, ihrer Rache Ziel Erreicht, vernahm ich nicht. Mein Vater führte Der Griechen Heer. In Aulis harrten sie Auf günst'gen Wind vergebens; denn Diana, Erzürnt auf ihren grossen Führer, hielt

Die Eilenden zurück und forderte
Durch Kalchas' Mund des Königs alt'ste Tochter.
Sie lockten mich der Mutter mich ins Lager;
Sie rissen mich vor den Altar und weiheten
Der Göttin dieses Haupt.

4. Als Ludwig XII. im Jahre 1515 starb, folgte ihm der jugendlich kühne und ehrgeizige Franz. I. auf dem Französischen Throne; und um seine Regierung mit einer glänzenden That zu beginnen, brach er noch in demselben Jahre mit einem Heere nach Italien auf und eroberte Mailand wieder. Die Schweizer, welche der Stadt zu Hilfe kamen und sich unvorsichtig in ein Treffen einlieszen, wurden bei Marignano nach zwei heissen Tagen besiegt. Es war die erste grosse Schlacht, die sie gänzlich verloren. Das französische Geschütz und die deutschen Lanzenknechte, die im französischen Solde dienten und von nun an als das beste Fussvolk galten, gewannen den Sieg. Der Kaiser Maximilian zog zwar im folgenden Jahre noch einmal nach Italien und belagerte Mailand, allein sein Alter und so viele mislungene Bestrebungen machten ihn zum Frieden geneigt; überdies schmolz sein Heer aus Mangel des Soldes schnell zusammen; er überliess in dem Vergleich zu Brüssel im Jahre 1516 das Herzogthum Mailand dem französischen Könige und gab, was ihm fast noch empfindlicher war, der verhassten Republik Venedig die wichtige Festung Verona zurück. So endigte sich nach vielfachem Wechsel der Streit in Italien, auf welchen Maximilian seine beste Kraft hatte verwenden müssen.

SECTION II.—GRAMMAR AND IDIOMS.

(a.) Show the derivation and meaning of every part of which the following are composed:—*Unausprechliches, unwiderstlich, anbetungswürdig, bemerkenswerth.*

(b.) State the second person singular indicative in every tense of *haben* and *sein*.

(c.) Decline in every case, singular and plural, the German of—That rich man. Our beautiful land. Cold night.

(d.) Give the definite article with each of the following substantives, in the genitive singular, and the dative plural:—*Maus, Tochter, Haufe, Vetter, Bach, Wald.*

(e.) Give three examples where in English the passive, in German the reflexive verb is used.

(f.) Conjugate the present and perfect of—*Dürfen, nehmen, bleiben, tragen, sehen.* Add also the first person singular of the imperfect and the participle past.

(g.) Was hat's gegeben?

Ich will dir Beine machen.

Er soll in sich gegangen sein.

Sie haben das Hasenpanier ergriffen.

Es ging hunt her.

Meinetwegen; was geht das mich an?

Der wird nie auf einen grünen Zweig kommen.

Er ist so blutjung und hat sich schon versprochen.

Das steht mir ganz und gar nicht an.

Er hat ihm ein X für ein U gemacht.

Ich kann mir das nicht zusammenreimen.

Das sind wahre Sonntagskinder.

SECTION III.

[The writing, either in English or German characters, must be thoroughly legible and distinct.]

1. I did not see those people you spoke of.

2. Were there many persons in the theatre?

3. The half of one-eighth is one-sixteenth.

4. One morning they were obliged to leave the town.

5. Do come to us to-morrow morning.

6. Who of us is to fetch your cloak?

7. Is that a cousin of yours or of hers?

8. With all his riches he could never be content.

9. At the appointed hour, he said, he would come to meet us.

10. He offered us a glass of wine.

11. He would sit down and write the whole morning.

12. Having sat down, he began to tell us a story.

13. What sort of house does he now live in?

14. We had never been told how that happened.

15. I could not believe that he had acted thus.

16. He wished me to go to his father and tell the circumstance.

17. How to express our thoughts we hardly know.

18. Had I been in your place, I would have acted differently.

19. Can you tell me, who has done this?

20. 1685. At the head of the English watering places, without a rival, was Bath. The springs of that city had been renowned from the days of the Romans. It had been, during many centuries, the seat of a bishop. The sick repaired thither from every part of the realm. The king sometimes held his court there. Nevertheless, Bath was then a maze of only four or five hundred houses, crowded within an old wall, in the vicinity of the Avon. Pictures of what were considered as the finest of those houses are still extant, and greatly resemble the lowest rag-shops and pot-houses of Radcliffe-highway. Even then, indeed, travellers complained of the narrowness and meanness of the streets. That beautiful city, which charms even eyes familiar with the masterpieces of Bramante and Palladio, and which the genius of Anstey and of Smollet, of Frances Burney and of Jane Austen, has made classic ground, had not begun to exist.

SECTION IV.

Questions on German History and Literature.

(a.) State the years of the reign of Maximilian I.

(b.) What was the league of the "Bundschuh," and "Des armen Kunzen?"

(c.) By what great discoveries is the close of the middle ages distinguished?

(d.) Who was Ulfla? When did he live? What has made him renowned?

(e.) What is the character of alliterative poetry, and when did it flourish?

(f.) What did Otfrid write?

Give, in German, a description of the destruction of a large warehouse by fire.

(To be continued.)

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

DUNDEE, 1867.

The following is a list of the Papers read in the different Sections:—

THURSDAY, SEPTEMBER 5TH.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

W. R. Birt—Report of Lunar Committee.

J. Glaisher—Some Remarks on the Original Objects and General Work of the Lunar Committee.

J. Clerk Maxwell—On a Real Image Stereoscope, with Illustrations of Solid Geometry.

Balfour Stewart—On the Behaviour of the Aneroid Barometer at Different Pressures.

Sehnor Capello—A comparison of the Kew and Lisbon Magnetic Curves during the Disturbance of February 20—25, 1866. Communicated by Dr. Balfour Stewart.

Rev. R. Harley—On a Certain Cyclical Symbol.

James Lindsay (the late)—Proof of the Binomial Theorem. Communicated by W. B. Grant.

F. W. Moffatt—On Meteorological Observations at Sea. Communicated by Dr. Moffatt.

J. Moffatt, M.D.—Experiments on the Luminosity of Phosphorus.

Dr. T. L. Phipson—On the Phenomena which occur when Magnetized Steel is Dissolved in Acids.

SECTION B.—CHEMICAL SCIENCE.

President's Address.

A. R. Catton—Report on the Synthesis of Certain Organic Acids.

A. R. Catton—On the Synthesis of Formic Acid.
J. A. Wanklyn and R. Schenk—On the Synthesis of Caproic Acid.

J. A. Wanklyn—Action of Sodium on Valerianic and similar Ethers.

P. T. Main and A. R. Catton—On a new Synthesis of Ammonia.

J. Spiller—On the Decay of Stone.

W. Weldon—On the Regeneration of the Oxide of Manganese.

SECTION C.—GEOLOGY.

President's Address.

Robert Chambers, LL.D., F.R.S.E.—Notice of an "Eker" at St. Fort.

D. Milne Home—On the Old Sea Cliffs and Submarine Banks of the Firth of Forth.

E. A. Wümsch—On some Carboniferous Fossil Trees embedded in Trappean Ash, in the Isle of Arran.

Professor Harkness and Dr. H. A. Nicholson—On the Coniston Group of the Lake District.

Dr. H. A. Nicholson—On the Graptolites of the Skiddaw Slates.

Dr. H. A. Nicholson—On the Nature and Systematic Position of the Graptolites.

R. H. Scott—Preliminary Report of the Committee for the Exploration of the Plant Beds of North Greenland.

SECTION D.—BIOLOGY (DEPARTMENT OF ZOOLOGY AND BOTANY).

Opening Address by the President of the Section.

C. Spence Bate—Report on the Fauna and Flora of the Southern Coasts of Devon and Cornwall.

J. Gwyn Jeffreys—Fourth Report on Dredging among the Shetland Isles.

Dr. Mörch—Notice of Dredging by the late Dr. Möller, off Fair Isle.

Dr. McIntosh—Remarks on Mr. Gwyn Jeffreys' Collection of Hebridean Annelids.

Dr. C. Collingwood—On Palagic Floating Animals observed at Sea.

Dr. C. Collingwood—Notes on Oceanic Hydrozoa.

Dr. Anton Dohrn, of Jena—On the Morphology of the Arthropoda.

SECTION D.—BIOLOGY (DEPARTMENT OF ANATOMY AND PHYSIOLOGY).

Professor Bennett—New Investigations to determine the Amount of the Bile secreted by the Liver, and how far this is influenced by Mercurials.

Professor Turner and Dr. M. Foster—To exhibit some preparations of the finest Bile Ducts.

Dr. Davy—On the Influence of Air on Vital Action as tested by the Air-pump.

Dr. G. Robinson—On certain Effects of the Concentrated Solar Rays upon the Tissues of Living Animals immersed in Water.

Dr. W. B. Richardson—On Coagulation of the Blood—a correction of the Ammonia Theory.

SECTION E.—GEOGRAPHY AND ETHNOLOGY.

The President's Address.

Lieut. S. P. Oliver, R.A.—Two Routes through Nicaragua.

Mrs. Lynn Linton—The Ethnography of the French Exhibition.

Capt. Murray, U.S.N.—On the Physical Geography of Nicaragua.

J. Crawford—Food of the Aborigines of Australia.

SECTION F.—ECONOMIC SCIENCE AND STATISTICS.

The President's opening Address.

Report of Committee on Uniformity of Weights, Measures, and Coins.

James Yates—Reasons why the Office of Weights and Measures should include Standard Weights and Measures of the Metric System in addition to the Imperial Weights and Measures.

Sir John Bowring—On Productive Labour in Prison as associated with the Reformation of Criminals.

James Oldham—On the Utilisation or more Productive Employment of Male Convicts.

SECTION G.—MECHANICAL SCIENCE.

President's Address.

Report of Steamship Committee.

J. V. N. Bazalgette—On an improved "Tanner" or "Local Topographical Indicator."

Joseph Mitchell, C.E.—On the Construction of Works of the Highland Railway.

John Fernie—On the Iron and Steel at the Exhibition.

David Greig—On Steam Cultivation.

FRIDAY, SEPTEMBER 6th.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

J. Glaisher—Report on Luminous Meteors.

Sir D. Brewster—On the Colours of Soap Bubbles.

Sir D. Brewster—On the Figures of Equilibrium in Liquid Films.

Sir D. Brewster—Notice respecting a Haystack with Lightning at Dun, in Forfarshire.

Dr. Everett—On the Results of Observations of Atmospheric Electricity at Kew, and Windsor, Nova Scotia.

W. Ladd—On a Dynamo-Magnetic Machine.

W. Ladd—On a Magneto-Electric Machine.

Sir W. Thomson—Electric Machines founded on Induction and Convection.

Professor Rankine—On the Approximate Drawing of Circular Arcs of Given Lengths.

Rev. R. Harley—On Finite Solutions of Algebraic Equations.

Hon. J. Cockle—On the Inverse Problem of Conic Sections, communicated by Rev. R. Harley.

A. Claudet—A New Fact of Binocular Vision.

A. Claudet—On a Mechanical Means of Producing the Differential Motion required to Equalise the Forces for the Different Planes of a Solid.

SECTION B.—CHEMICAL SCIENCE.

Lauder Lindsay—On the Present Uses of Lichen Dye Stuffs.

J. Alfred Wanklyn—On the Existence of Putrescent Matter in River and Lake Waters.

Dugald Campbell—A Note on Messrs. Wanklyn, Chapman, and Smith's Method of Determining Nitrogenous Organic Matters in Water.

A. E. Fletcher—On an Ether Anemometer for Measuring the Speed of Air in Flues and Chimneys.

A. E. Fletcher—On a Self-Registering Pyrometer.

G. Ansell—On an Apparatus for Indicating the Pressure and Amount of Fire Damp in Mines.

Professor Lawson—Notes of the Analyses of Gold Coins.

SECTION C.—GEOLOGY.

J. Wyatt—On the Gradual Alteration of the Coast Line in Norfolk.

George Maw—On the Cambrian Rocks of Lincolnshire with reference to a Break in the Conformable Succession of the Lower Beds.

Dr. Oldham—On the Geology of India.

The President—An Account of the Progress of the Geological Survey of Scotland.

H. Woodward—Third Report on Fossil Crustaceans.

F. M. Burton—On the Lower Lias, and Traces of an Ancient Rhetic Shore in Lincolnshire.

J. E. Taylor—On the Norfolk Chalk-marl.

H. S. Ellis—On the Mammalian Remains from the Submerged Forest in Barnstaple Bay, Devonshire.

ON D.—BIOLOGY (DEPARTMENT OF ZOOLOGY AND BOTANY).

Cobbold—Remarks on the Entozoa of the Common and of Game Birds, in their supposed relation to Triclose Disease.

Ray Lankester—Note on the Boring of Limestone certain Annelids.

Murray—On the Future Administration of the Natural History Collections of the British Museum.

J. Lubbock—On some Points in the Anatomy of *sanura*.

Lauder Lindsay—Is Lichen-growth any criterion of the Age of Pre-historic Structures?

Lauder Lindsay—Is Lichen-growth detrimental to Forest and Fruit Trees?

Maxwell T. Masters—On Polliniferous Ovules in *Rosa arvensis*.

Charles Martins—To Exhibit Specimens of the Airing Roots of *Tussia repens*, and Specimens of the same cultivated under different Biological Conditions.

Heaton—On certain Simulations of Vegetable withs.

P. Hiern—On the Occurrence of *Aster salignus*, Ld., in Wicken Fen, Cambridgeshire.

Professor Dickson—To Exhibit an Abnormal Leaf of *Pinus Lauro-cerasus*.

SECTION D.—BIOLOGY (DEPARTMENT OF ANATOMY AND PHYSIOLOGY).

Professor C. Martins—To Exhibit Osteological Preparations, with Photographs, to illustrate the Comparison of Limbs deduced by the Torsion of the Humerus.

Dr. Ogilvie—On the Adaptation of the Structure of the Shell of the Bird's Egg to the Function of Respiration.

Professor Turner—A Contribution to the Anatomy of the Pilot Whale.

Sir Duncan Gibb—Vocal and other Influences upon the Development of the Pendency of the Epiglottis.

Dr. McIntosh—Notes of Experiments with Poisons, &c., on Young Salmon.

Professor Bennett—On Protagon in Relation to the Molecular Theory of Organisation.

Dr. B. W. Richardson—On Some Effects produced by Applying Extreme Cold to certain Parts of the Nervous System.

SECTION E.—GEOGRAPHY AND ETHNOLOGY.

Captain C. W. Wilson—Report of the Palestine Exploration Fund.

Captain C. W. Wilson—Recent Discoveries in and around the Site of the Temple at Jerusalem.

Lieutenant Anderson—Notes of a Reconnaissance of Some Portions of Palestine.

Rev. H. B. Tristram—On the Districts of Palestine as yet imperfectly Explored.

Sir R. I. Murchison—Observations on the Livingstone Search Expedition now in progress.

Professor D. T. Ansted—The Lagoons of Corsica.

Major R. Stuart, C.B.—The Wallachs of Mount Pinus.

SECTION F.—ECONOMIC SCIENCE AND STATISTICS.

Professor Leone Levi—On the Condition and Progress of Scotland in Relation to England and Ireland in Population, Education, Wealth, Taxation, Crime, Consumption of Spirits, Savings Banks, &c.

Report of the Committee on the "Uniformity of Weights, Measures, and Coins" (so far as it relates to Coins).

Frank P. Fellowes—On the various Methods in which our Coinage may be Decimalized; the Advantages and Disadvantages of each.

Henry J. Kar Porter—On the Prevalence of Spedalske or Leprosy in the Kingdom of Norway.

SECTION G.—MECHANICAL SCIENCE.

Rev. Patrick Bell—On Reaping Machines.

Professor J. Clerk Maxwell—On the Theory of Diagrams of Forces as applied to Roofs and Bridges.

George Fawcett—On the Stowage of Ships' Boats.

George Maw—Covered Life Boats.

Professor Macdonald—On the Construction of the Life Boat.

John Halliday—On the Heating of Hot Houses.

Wm. Paterson—On the Consumption of Fuel.

J. D. Everett, D.C.L.—On the Rigidity of Glass, Steel, and Brass.

SATURDAY, SEPTEMBER 7TH.

SECTION E.—GEOGRAPHY AND ETHNOLOGY.

J. Crawford, F.R.S.—On the Antiquity of Man.

P. N. Compton—On the Coasts of Vancouver's Island and British Columbia.

J. J. Pratt—On the Colony of New Scotland.

J. Crawford, F.R.S.—On the Complexion, Hair, and Eyes as the Tests of the Races of Man.

J. Crawford, F.R.S.—On the supposed Aborigines of India, as distinguished from its Civilised Inhabitants.

H. H. Howarth, F.E.S.—On some Changes of Surface affecting Ancient Ethnography.

Captain Bedford Pim, R.M.—On the Mining District of Chontales, Nicaragua.

MONDAY, SEPTEMBER 9TH.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

G. J. Symons—Report of the Rainfall Committee.

Alexander Brown—Observations of the Rainfall at Arbroath.

John Thruston—On Evaporations from Rain Gauges.

Colonel Sykes—On Storm Warnings, their importance and practicability.

George Forbes—On the Meteor Shower of August, 1867.

Sir D. Brewster—On the Colours of Films of Alcohol.

Sir D. Brewster—On the Radiant Spectrum.

Sir D. Brewster—Notice respecting Mr. Macrae's Photographs upon Glass and Porcelain.

A. Claudet—Photographic Portraits obtained by Single Lenses of Rock Crystal and Topaz.

SECTION B.—CHEMICAL SCIENCE.

A. Crum Brown—Remarks on the Calculus of Chemical Operations.

Maxwell Simpson—On the Formation of Succinic Acid from Ethylidene.

Maxwell Simpson and Gautier—On a Compound formed by the direct union of Anhydrous Prussic Acid and Aldehyde.

A. R. Catton—On Loewig's Researches on the action of Sodium Amalgam on Oxalic Ether.

I. Lowthian Bell—On a method of recovering Sulphur and Oxide of Manganese, used at Dieuze, near Nancy, France.

J. H. Gladstone—On the Refraction Equivalent of Salts in Solution.

J. Spiller—On certain New Processes of Photography.

W. Crookes—On a new Polarizing Photometer.

SECTION C.—GEOLOGY.

W. Pengelly—Third Report of the Committee for the Exploration of Kent's Cavern, Devonshire.

Professor Ansted—On the Conversion of Stratified Rock into Granite in the North of Corsica.

Dr. Julius Schvarcz—On the Internal Heat of the Earth.

Dr. C. Le Neve Foster—On the Preseberg Iron Mines, Sweden.

F. Gordon Davis—On the Calamine Deposits of Sardinia.

Dr. C. Collingwood—On the Geology of the North of Formosa.

Dr. C. Collingwood—Notes on the Geology of the Islands around the north part of Formosa.

SECTION D.—BIOLOGY (DEPARTMENT OF ZOOLOGY AND BOTANY.)

W. Carruthers—On British Fossil Cycads.

A. R. Wallace—On Birds' Nests and their Plumage, or the relation between Sexual Differences of Colour and the mode of Nidification in Birds.

Dr. Collingwood—Observations on the Habits of Flying Fish.

Dr. Collingwood—On Trichodesmium, or Sea Dust.

Professor Allman—Notes on the Structure of certain Hydroid Medusæ.

Dr. McIntosh—Report on the Marine Fauna of St. Andrews.

Dr. McIntosh—The Annelids of St. Andrews.

W. Stephen Mitchell—Report on the Leaf Beds of the Lower Bagshot Beds of Hants and Dorset.

W. Brown—On the claims of Arboriculture as a Science.

SECTION D.—BIOLOGY (DEPARTMENT OF ANATOMY AND PHYSIOLOGY).

Dr. B. W. Richardson—Report on Methyl Compounds.

E. Ray Lankester—Observations with the Spectroscope on Animal Colouring Matters.

Professor Allen Thomson—Exhibited Microscopical Preparations of the Cochlea, of the Retina, and of Teeth of Fossil Fishes.

Dr. Polli—On the Antiseptic Properties of the Sulphides.

Professor Cleland—On the Epithelium of the Cornea of the Ox in relation to the growth of Stratified Epithelium.

Professor Cleland—On some points connected with the Joints and Ligaments of the Hand.

SECTION E.—GEOGRAPHY AND ETHNOLOGY.

Sir John Lubbock, Bart., F.R.S.—On the Origin of Civilization and the Early Condition of Man.

Messrs. Wallace and Mayne—A Peruvian Expedition to the River Ucayali.

Dr. Collingwood—A Boat Journey round the Northern end of Formosa.

Dr. John Davy—On the Character of the Negro, chiefly in relation to Industrial Habits.

T. Baines—On Wallfish Bay and the Ports of South Africa.

J. Crawford, F.R.S.—On the Dissemination of the Arabian Race and Language.

H. H. Howarth, F.E.S.—On the Origines of the Norsemen.

H. C. Criswick—Life amongst the Veps.

SECTION F.—ECONOMIC SCIENCE AND STATISTICS.

Alex. J. Warden—On the Linen Manufacture of Dundee.

James G. Orchar—On the Engineering Trade of Dundee.

Henry Gourlay—On the Iron Shipbuilding of Dundee.

James Yeaman—On the Seal and Whale Fisheries of Dundee.

Frank Henderson—On the Leather Manufacture of Dundee.

C. C. Maxwell—On the Confectionary and Marmalade Trade of Dundee.

A. Robertson—Statistics of the Social Condition of Dundee.

E. Renals—On Arbitration in the Nottingham Hosiery Manufacture.

Dr. Lauder Lindsay—On the Obstacles to the Utilization of New Zealand Flax.

A. Stephen Wilson—On the Measure and Value of Oats.

SECTION G.—MECHANICAL SCIENCE.

Report of the Committee on the Patent Laws.

Wm. Fairbairn, C.E., LL.D., &c.—Report on Experimental Researches on the Mechanical Properties of Steel in its present improved State of Manufacture.

G. B. Galloway—On the Application of the Funds derived from Patent Fees.

General Haupt, U.S. America—On the Application of Machinery to Boring and Tunnelling.

Dr. C. Le Neve Foster—An account of Bergstrom's Boring Machine used at the Preseberg Mines, Sweden.

Joseph Mitchell, C.E., F.R.S.E.—On a New Mode of Constructing the Surface of Streets and Thoroughfares.

Latimer Clark, C.E.—On the Birmingham Wire Gauge.

TUESDAY, SEPTEMBER 10TH.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

C. Meldrum—On the Meteorology of the Mauritius.

C. Meldrum—On the Hurricanes of the Indian Ocean.

F. Jenkin—Report of the Committee on Electrical Standards.

J. P. Joule—Determination of the Mechanical Equivalent of Heat, from Experiments on the Heat Evolved by Currents of Electricity.

C. W. Siemens—On a Resistance Measurer.

J. Jenkin—On a Modified Form of Siemen's Resistance-measurer.

C. Hockin—Examination of the Permanency of the Standard Resistance Coils to be deposited at the New Observatory.

Sir William Thomson—On a Series of Electrometers for Comparable Measurements through great range.

W. Hooper—On the Electrical Induction of Hooper's Insulated Wires.

Thomas Stevenson—Notice of a proposal to illuminate Beacons and Buoys at Sea by Electricity conveyed by Submarine Wires connected with the Shore.

T. Archer Hirst—On the alleged Correspondence between Newton and Pascal recently communicated to the French Academy.

Sir David Brewster—On the alleged Correspondence between Pascal and Newton. (The letters of Newton were exhibited.)

Sir Wm. Thomson—On Volta-convection by Flame.

Sir Wm. Thomson—On a Self-acting Electrostatic Accumulator.

Sir Wm. Thomson—On a Uniform Electric Current Accumulator.

Bierens de Haan—On a Theorem in the Integral Calculus.

B. Davis—A list of 5,600 Prime Numbers.

A. R. Catton—On the Laws of Symmetry of Crystal-line Forms.

A. R. Catton—A Contribution towards the Expression of the Angle between the Optic Axes of a Crystal in terms of the Angles between the Faces.

A. R. Catton—On the Theory of Double Refraction, with special reference to the Influence of the Material Molecules on the Propagation of Light in Crystals.

N. de Khanikof—Experiments for the Verification of the Law of Henry and Dalton on the Absorption of Gases by Liquids.

SECTION B.—CHEMICAL SCIENCE.

I. Lowthian Bell—On the Present State of the Manufacture of Iron in Britain, and its position as compared with that of some other countries.

J. B. Lawes and J. H. Gilbert—Preliminary Notice of Results on the Composition of Wheat, grown for Twenty Years in succession on the same Land.

R. F. Smith—On the Gaseous Products of the Destructive Distillation of Hydro-carbons, obtained from Shales and Coals at Low and High Temperature.

P. Spence—On the Economisation of the Sulphurous Acid in Copper Smelting.

W. L. Scott—On the Bisulphite of Calcium as a Preservative of Animal Substances.

W. L. Scott—Note on the Artificial Production of Oil of Cinnamon.

T. T. P. Bruce Warren—On the Electrical Resistances of the Fixed and Volatile Oils.

SECTION C.—GEOLOGY.

Mr. R. Slimon's Collection of Crustacea will be Exhibited in this Section.

W. Carruthers—Enumeration of British Graptolites.

E. Hull—On the Structure of the Pendle Range, Lancashire, as illustrating the South-Easterly Attenuation of the Carboniferous Sedimentary Rocks of the North of England.

W. S. Mitchell—Second Report on the Alum Bay Leaf Bed.

E. Hull—Observations on the Relative Geological Ages of the Principal Physical Features of the Carboniferous District of Lancashire.

W. Carruthers—On British Fossil Cycadaes.

W. Carruthers—On Calamites and Fossil Equisetaceae.

Professor Charles Martins—On the Ancient Glacier of the Valley of Argelez, in the Pyrenees (read in French by the author).

P. W. Stuart Menteath—On Tertiary and Post-tertiary Action in the Pyrenees.

C. W. Peach—On New Fossil Fishes from Caithness and Sutherland.

E. Ray Lankester—On some New Cephalaspidean Fishes.

J. F. Walker—On a New Phosphatic Deposit.

Captain F. Brome—Notice of Recent Discoveries in Caves of Gibraltar, communicated by G. Busk, F.R.S.

Prof. Ansted—On the Lagoons of Eastern Corsica.

Rev. W. H. Crosskey—Notes on the Relation of the Glacial Shell Beds of the Carse of Gowrie to those of the West of Scotland.

John Plant—On the Geology and Fossils of the Lingula Flags at Upper Mawddach, North Wales.

Rev. J. Gunn—On Tertiary and Quarternary Deposits in the Eastern Counties, with reference to Periodical Oscillations of Level and Climate.

SECTION D.—BIOLOGY (DEPARTMENT OF ZOOLOGY AND BOTANY).

Rev. A. Merle Norman—Preliminary Report on the Crustacea, Molluscoida, and Cælenterrata, procured by the Shetland Dredging Committee in 1867.

Professor Newton—Supplement to Report on the Diverse Birds of the Mascarene Islands.

E. J. Lowe—On the abnormal forms of Feras.

Prof. Balfour—Notice of some rare Plants recently collected in Scotland.

Dr. Fraser—On the occurrence of a new British Moss in Dovedale.

Dr. Collingwood—On the remarkable Marine Animals observed in the China Seas.

E. Ray Lankester—On the Anatomy of *Patella*.

H. Alleyne Nicholson—On the Nature and Zoological Position of the Graptolide.

Dr. Grierson—On the Destruction of Plantations at Drumlanrig by a species of Vole.

Rev. H. B. Tristram—On the Zoological Aspects of the Grouse Disease.

Dr. Lander Lindsay—On the Conservation of Forests in our Colonies.

Sir James E. Alexander—On the Preservation of Fishing Streams.

C. W. Peach—On Naked-eyed Medusæ, from Peterhead, Wick, and other British Localities, including some new species.

C. W. Peach—On the Fructification of *Griffithsia Corallina*, found in the West Voe, at the Out Skerries, Shetland.

SECTION D.—BIOLOGY (DEPARTMENT OF ANATOMY AND PHYSIOLOGY).

Dr. C. Collingwood—A new Form of Cephalopodous Ova.

Professor Cleland—To exhibit Microscopical Preparations of the Nerves of the Cornea.

Professor Turner—To exhibit Microscopical Preparations in illustration of the Minute Anatomy of the Nervous System.

Wentworth L. Scott—On the presence of Quinine and other Alkaloids in the Animal Economy.

Dr. Polli—On the Antiseptic Properties of the Sulphides.

R. Dunn—On the Phenomena of Life and Mind.

F. Melville—Life: its Nature, Origin, &c.

SECTION E.—GEOGRAPHY AND ETHNOLOGY.

Sir R. I. Murchison, Bart., K.C.B.—Announcement of the International Prehistoric and Anthropological Congress for 1867.

M. Lucien de Puydt—Exploration of the Isthmus of Darien, with a view of discovering a Practicable Line for a Ship Canal.

J. Crawford, F.R.S.—On the supposed Plurality of the Races of Man.

Cyril Graham, F.R.G.S.—On Exploration in Palestine to the east of Jordan, and on future intended Operations.

J. W. Barnes, C.E.—Exploration of Belochistan and Scind, with a view of an examination of the Subterranean Supply of Water.

J. Crawford, F.R.S.—On the History and Migration of Sacchariferous or Sugar-yielding Plants in reference to Ethnology.

W. Perkins—Exploration of the Grand Chaco in La Plata, with an account of the Indians.

Antonio Raimondi—Account of the Wild Indians inhabiting the Forests in the interior of Huanta, Peru, with observations on their Crania compared with those of ancient races.

SECTION F.—ECONOMIC SCIENCE AND STATISTICS.

Professor E. T. Rogers—On the Funds available for Developing the Machinery of Education.

Colonel Sykes, M.P.—Analyses of the Report upon the State of the Empire of France, presented to the Senate and Legislative Body, February, 1867. (*Exposition de la situation de l'Empire, présentée au Sénat et au Corps Législatif. Février, 1867.*)

Ferdinand Kohn—On Iron and Steel at the Paris Exhibition.

R. Lewis—On an Improved Marine Steam Boiler.

J. Eckerley—On J. R. Swan's Improved Calcining Kilns.

S. J. Mackie—On Iron Floating Forts, Iron Harbours, and other Floating Structures; and on Daft's Method of Construction of Iron Fabrics.

A. S. Hallidie, C.E.—On an Improved Suspension Bridge.

Professor Macdonald—On an Improved Paddle Wheel.

Wm. Hooper—Electrical Induction.

W. W. Urquhart—On some of the Difficulties the Scientific Engineer meets with in practice.

WEDNESDAY, SEPTEMBER 11TH.

SECTION A.—MATHEMATICAL AND PHYSICAL SCIENCE.

C. Wheatstone—On a New Telegraphic Thermometer, and on the Application of the Principle of its Construction to other Meteorological Indicators.

Major Tennant—On Preparations for Observing the Total Solar Eclipse of August 18th, 1868.

R. Russell—On some Deductions by Dr. Tyndall from his recent Experiments regarding the Radiant and Absorptive Properties of Vapour in the Atmosphere.

PARIS EXHIBITION.

The independent competitive trial of steam ploughs, which has already been mentioned in the *Journal*, is appointed to take place on the 19th and 20th of the present month, at Petit-Bourg, on the farm of M. Decauville, a distinguished agriculturist, and at the same time will be tried any kind of sub-soil or other ploughs which turn over or penetrate the earth to the depth of 35 centimetres (14 inches). A considerable number of French and English ploughs are already entered, including the double Brabants of MM. Kondeur and Iscultz freres, the Contgreade and Tweedale ploughs, the subsoil plough of Dombasle of Nancy, the ploughs of Grignon and Bonnet of Avignon, and Howard's great plough. The lists will be open until the 18th instant. The jury will note the depth of the furrows, the extent of surface acted upon, the time occupied by each implement including preparation for the work, the quantity of fuel consumed, the power employed, the number of men and of horses or oxen engaged, the nature of the soil, and any other circumstances which may aid in estimating the cost and quality of the work done. The first day will be devoted to the labours of the jury, and on the second the public will be admitted; the terms and conditions of the competitions are not yet published. Petit-Bourg is not quite an hour's journey from Paris, either by the Lyons or Orleans railway. It is reported that, in consequence of these free competitive trials, the Imperial Commission has renounced its trials altogether; but, if so, there will be an unfortunate blank in the official list of awards at the Exhibition.

A new cooking apparatus, or rather a partially new method of cooking, has appeared in the park of the Exhibition, and has created a great sensation. It is the invention of a Norwegian, and comes with certificates of recommendation from one of the Ministers of Sweden and Norway. The principle is explained in a few words, and anyone may try the efficiency of the system for himself without difficulty; the meat or vegetable to be boiled or stewed is placed in a saucepan with a well-fitting cover but without a handle, and left on the fire for five minutes only after it has attained the boiling point; it is then placed in a box thickly padded on all sides with felt or hair, and the heat escaping very slowly indeed, the cooking continues. The apparatus is in daily operation, the viands being boiled for five minutes over a gas stove, sealed up in one of the boxes and opened in presence of the public two hours or so afterwards. One of the proposed applications of the inven-

tion is cooking for armies or for travellers, and is the keeping cooked dishes hot for a long period at the end of eighteen hours the contents of the can are still hot and the flavour of the preparation is said, uninjured. It is stated that the system is now on board Norwegian and other ships, the cooking water being 20 per cent. besides the immense saving of fuel. This curious invention brings to mind a query, whether an egg of which the shell is very harder in consequence of the enclosed heat, will answer it in the affirmative; if an egg were for, say, three minutes, then wrapped up in a conducting substance and left there for an hour, would supply an illustration on a small scale of the principle of the new system.

As in the case of former great exhibitions, the strong disinclination to see the building in the Bois de Mars, or at any rate the great outer circle, diminished, and one of the proposals put forth for its improvement merits attention apart from the immediate question. Brissac, an engineer, suggests that the present gallery should be converted into a mechanical gallery with steam or other motive engines of 2,000 horse power for the convenience of small manufacturers, and calculates that thus arranged it would bring an interest of about £150,000. The Imperial Commission, announcing the positive closing of the exhibition on 31st October, invites tenders for the purchase of the building and materials, to be sent in by the end of the present month. There is also a rumour circulating that the building will be purchased by the Government for the purposes of a new ministry, which would include the postal and telegraphic services and the imperial printing establishment.

SUEZ CANAL.

(Continued from page 652).

Never before have such extensive earth-works—500 leagues from Europe, in completely desert regions—been undertaken. Not long since, Paris was at work at the Trocadéro, opposite the Champ de Mars, where four millions of metres of land were levelled; this is small in comparison with seventy millions of metres at the Suez Canal. When the Company first began its work it reckoned on the assistance of manual labour in Egypt; this great mass of earth. The Egyptian labourer is quick; he uses no tools; with his hands he crosses the ground, fills baskets, which he carries on his head to the place where the contents are to be overturned, to form the rampart or bank. The work is rapid because the labourers are numerous. In any other country, Egypt the cost would be enormous, but in the same land of the Pharaohs, where it has been for ages the custom to make the population pay a portion of the taxes by labour, the employment of men in great numbers is not considered in the light of slave labour.

The company, under agreement with Mahomed Pacha, thought they should do a humane work and ameliorate the lot of the fellahs, in giving them work, when they could be legally employed in gratuitous work. The inhabitants were employed in the beginning in constructing the banks of the canal in the La Menzaleh; they were made to excavate the fresh water canal, and were afterwards engaged, to the number 20,000, upon the table land of El Guisr, where they were cutting for the maritime canal. It was there that the Company, after a long dispute and a decisive arbitration, were, on receiving a certain amount for compensation, deprived of this element of the work. The work was suspended, and it was necessary to explore new means of execution, and to substitute machinery for men. The company had to overcome this difficulty; it had been foretold they would be overcome by difficulties of all kinds to surmount, obstacles of political jealousies, jealousies of men, &c. The company obtained the assistance of skilful contractors, who

had great former experience. The company had taken possession of the Desert; it was already established there. The fresh-water canal carried to the centre of the isthmus supplies of material, and drinking water. The works, properly called of the maritime canal were confined nearly to the earth works begun by the fellahs. Some dredging machines of small power had, it is true, been employed to fill up the marshes around Port Said, or to deepen the channel opened in Lake Menzaleh. More powerful dredging machines had been ordered, but these measures taken by the company, in expectation of the combination of machines with the fellahs' work would not be sufficient in the new order of affairs. A cutting of two mètres deep, and of unequal breadth, was opened from Port Said to Lake Timah; it was protected by banks which had begun to harden. On the Suez side no vigorous impulse had yet been given to the work. The bank of the Sémépéum had scarcely been raised. It was specially here that the company had reckoned on the work of the people of the country; and if they still had been able to obtain gangs of workmen, which the government of Egypt had before supplied, no doubt that, towards Suez especially, the raising of earth by wheelbarrows and baskets would have been carried on with great activity. In this state of affairs, it was first necessary to order dredging machines of greater power and in greater number, but the question was how to combine this power. It was not enough to turn, by means of steam power, a string of buckets to excavate the soil and raise the earth; it was necessary to empty the contents of the buckets and carry them to some distance, a slow operation, the cost of which might become so great as to render the operation impossible. The ordinary raising of earth by dredging machines is done in a simple manner. The soil is emptied into boxes which come alongside the dredging machine. When the boxes are full, the boat is sent away, and carries them along the bank. Cranes are stationed there, which seize the boxes, raise them, turn them over, and thus throw the soil to a distance of some mètres into the railway trucks. This plan, however easy under ordinary circumstances, becomes slow and costly when it is necessary to operate on considerable masses of material. Operating on this method, it would be impossible to foresee how long the work would take. The necessity was obvious of constructing new apparatus suitable to a work of exceptional importance, the exigencies of which had not been foreseen, and which involved the employment of means hitherto not used.

The principle of the small dredging machines gave the idea of the following apparatus, a model of which is shown in the Exhibition. To empty the material upon the edge, especially in the cuttings at Port Said, a trough of wood or sheet iron was placed under the buckets of the dredging machines; it received the material, and let it run to the ground. The inclination of this trough sufficed for the natural fall of mud or of sand extracted by the dredging machine. But this inclination could only be maintained when the dredging machine stood near the bank where the material was to be deposited. When the apparatus was moved back in order to excavate the canal to its centre, for instance, at 50 mètres from the edge of the water, the trough became useless. It could be lengthened, but then it had no slope. The stuff raised and deposited by the dredging machine soon filled the trough, and it would not reach the ground. Then supposing they were dredging in the middle of the canal, it was not only 50 mètres, or half the total width of the canal, which it was necessary to make the trough, but 10 or 20 mètres more, for it was not sufficient to carry the rubbish to the water's edge; it was necessary to throw it further to provide for further widening, and, above all, to avoid the partial falling in of the embankment into the canal itself. A simple solution of the difficulty was found; though simple, it was some time before it was thought of. They at first tried raising the frame of the dredging machine as high as possible, to the

summit of which the buckets were carried and turned over after coming out of the water. To avoid this very heavy framing, which would have upset the centre of gravity, dragging the whole thing over, it was strengthened by means of a framework of iron arranged upon the sides, and supported on a barge. At the height where the buckets empty the stuff brought from below, is placed the trough. In some cases it is 70 mètres long. This trough may be considered as a column of sheet iron cut from the top to the bottom, half of which is so placed as to form a bridge, leading from the dredging machine to the land. This aqueduct bridge is sustained between the dredging machine and the ground by a solid support, resting upon a barge or flat-bottomed boat, but not touching the bank. It is kept at a certain height above the soil, so that the material can fall readily on the ground when it has run from the top to the bottom of the trough. The principal difficulty to surmount was the want of slope in the trough, which was necessarily small on account of its length, and the small elevation of its end next the dredging machine. It was therefore not easy to get the material to run to the end of the trough. Several plans had been tried in shorter troughs; men provided with poles and rakes had pushed the material which stopped on its way, and cleared out the trough; but this plan on the required scale was too insignificant and costly. It was remarked, however, that the buckets in emptying the stuff into the troughs sometimes discharged a certain quantity of water, which was carried up mixed with solid material. This water, descending in fine streams, and introduced between the masses of earth and sand, united with them in the trough, disintegrated them, and finally washed them away; this gave the idea of introducing in the trough a current of water, neither too strong nor too weak; if too strong it would have run over the edge, if too weak the mass of earth would have absorbed it. Pumps were placed near the dredging machines, driven by steam, and water was made to run constantly into the trough, which carried with it the solid products of the dredging machine. This great trough arrangement forms the all important machine for piercing the isthmus. The canal is 160 kilometres from Port Said to Suez; more than a third will be dug out by means of this long trough with an ease and economy which it was impossible to have foreseen. The company can triumphantly show this invention to those of its detractors who had speculated on the works of the canal being abandoned when deprived of the native workmen. Whenever the banks of the canal are not too high, the long trough can be used to advantage. A great number of dredging machines ranged along the canal are provided with this instrument. Where the slope of the long trough has been inverse, that is, inclining from the bank to the dredging machine, it has been necessary to build a dredging machine expressly to overcome this difficulty.

The model of an iron elevator is shown; it was not possible to show the apparatus itself, because it is in use in Egypt, and belongs to the contractor and not to the company; besides, a collection of dredging machines, with the long trough, an elevator, a dry-excavator, and two boat supports, represent a capital of more than two million francs, without reckoning the expense of carriage and the loss of the use of these machines for a year; and besides, to exhibit them properly at work the Canal Company would have required the use of one whole side of the Champ de Mars, and the expense of erection would have amounted to a million francs. The elevator apparatus consists of two inclined girders of iron, fourteen mètres high; between these supports an endless chain turns, moved by steam, and upon this chain a vessel is attached, which, arriving at the top, is overturned, and discharges the stuff brought up. The stuff is brought up in boxes, hooked to carriages, and descends, when emptied, on the endless chain. There are eighteen of these elevators at work. The earth is carried to the bank by means of long troughs when the soil is lower than

the dredging machines, and by elevators when the soil is higher, so it only remains to provide for the conveyance of material where it cannot be deposited on the bank. For this purpose transport vessels have been built; some are made for sea use. Two decks are placed, one before and the other in the after part of the vessel, for the use of the crew and for working. The centre of the vessel is reserved for the stuff dredged up; it is separated into two cavities by a partition, reaching to the bottom of the vessel, and these are filled with the soil. When these receptacles are full the transport vessel is taken to sea, and by means of a lever the chains which hold the trap doors descend and let fall the material contained in the boat, which returns again under the dredging machine for a fresh load. Other boats of the same kind, with the same appliances, are intended to be used exclusively in the lagoons which the canal passes through. In some vessels the doors are at the bottom, in others at the side; they are made wide and flat, as is necessary for river boats, instead of being narrowed towards the keel like sea boats. There is also a dry excavator shown in full work, and one glance will show its mechanism and utility.

These are the principal models shown by the company; they comprehend the different combinations which have been adopted to excavate the canal and clear away the earth.

These machines, which for the most part present important improvements, are ingenious, economical, and above all practical. The science of dredging was in its infancy when the Suez Canal was commenced; dredging machines had not been employed on any great scale. Necessity is the mother of invention. After the example of what has been accomplished by the genius and perseverance of those employed by the Suez Canal Company, the difficulty of removing the greatest quantity of earth from under the water need no longer be feared. The company were deprived of the assistance of native workmen, and have substituted machines. No sufficiently powerful machines previously existed; it has created them, giving them a power hitherto unknown. The company has done great things; it has peopled a desert, built towns, introduced currency and industry into the isthmus; learning, civilization, and religion have been diffused.

The system of towage, invented by M. Bouquié, and called after him, has been adopted for the provisional transport of goods from one sea to the other by means of the fresh water canal. The system is that known as the immersed chain, upon which the towing vessel hauls itself along, drawing in its train barges laden with thousands of tons of merchandise. The advanced state of the works in the part of the canal leading from Port Said to Ismaila, and the complete construction of the fresh water canal, which, coming to Zagazig, thence descends directly on Suez, have enabled the company to arrange a regular service for the conveyance of merchandise and passengers from one sea to another. Numerous barges, destined to receive the cargoes, have been sent to Port Said, and are floating in the canal. A double system of traction has been adopted in the maritime canal, and, provisionally, six steam-boats tow the barges loaded from Port Said to Ismaila, and vice versa.

In the fresh water canal a system of towage has been established. Six tugs perform the service. Two are screw boats, built according to the usual plan, measuring 20 mètres long and 4 mètres wide, of 100 horse-power. The system of towage practised at the Canal Saint Martin, Paris, of which M. Bouquié is the inventor, has been adopted, as being at the same time the most simple and appropriate to the conditions of transit in the isthmus. The tugs employed will be 20 mètres long by 3-50 mètres wide, and are each furnished with an engine of 18 horse-power. The chain by means of which the traction is effected runs over a pulley with teeth, each link of the chain fitting exactly to the tooth of the wheel, which is placed on one of the

sides of the tug, an arrangement which allows it to be taken hold of and released with the greatest ease. This system has the advantages over the ordinary one of greater lightness and greater simplicity of management, being easier to manage in starting or stopping, and in the passing of two tugs going in opposite directions on the same chain. The conveyance of merchandise and passengers from one sea to another is now managed to convey 1,000 tons per day through the isthmus. The Canal Company have thus started its works.

A model of the works established at Ismaila, by Lasseron, is shown. Their object is to convey freight to Port Said, 80 kilometres distant. M. Lasseron's arrangements work well.

INDUSTRIAL EDUCATION AT CREUSOT

The following is from the *Pall Mall Gazette* of the 31st:—

The illustrations of the system of education prepared for the families of the skilled workmen at Creusot (département de Saône et Loire) which have been presented to the South Kensington Museum are a valuable and timely gift. We can only regret that the actual specimens of the actual work executed by these workmen, which fill a large building in the gardens of the Paris Exhibition, cannot be added to the handsome collection of M. Schneider, and exhibited along with them at the Kensington Museum, because by being separated they lose half their value. At Paris you not only see examples of the method of training and the work drawn by the pupils in the schools, but when you have reached the Englishman's conclusion that all this is very fine theory, but won't do in the practice of life, you are round to the works which these youths so trained afterwards executed in the workshops, and you are yourself compelled to own, perhaps reluctantly, that the better work has ever been produced in England.

Creusot may be said to form a kind of model manufacturing community, all placed under the direction of a single individual or firm, and consisting of 24,000 inhabitants. The number of workmen employed is 12,000; the steam power is equal to that of 9,750 horses. There are coal mines which produce 250,000 tons annually. There are iron mines which produce 250,000 tons of iron minerals per annum; and the annual production of iron is 130,000 tons. But it is not in the mere production of raw material that this community excels; it is in the skill. It converts its cast iron into all the forms of wrought iron employed in the manufacture of machinery or in the construction of large engineering works. In the course of a year it turns out 100 locomotives, about two a week. Although situated far inland, it is not without direct temptation to undertake naval engineering; it exhibits numerous samples of marine steam engines (of 950 horse-power) for the iron-clad ships of the imperial navy.

It is from the examination of these works that we are to the exhibition on the walls, and there see the moral and intellectual and social organization by which these have been accomplished. From their earliest youth the children of the workmen, male and female, are trained in schools organized by M. Schneider. A large plan of the model of the commune of Creusot, pictures of the habitations for workmen, churches, hospitals, and schools show the admirable provision which is made for a people of Creusot in these respects. Statistical tables illustrate the progress and changes of the population. These are divided into two parts—the one showing the progress of their material welfare, their accumulation of property, and their consumption of food and luxuries; the other showing the amount of attendance at schools, the relative statistics of individual success in the schools, and the subsequent rank attained by each person in the manufactories. From these we gather that the progress of education has always been followed by an improved moral character and advanced social well-being.

that the pupils who have most successfully availed themselves of the technical schools are those who have afterwards risen to the highest ranks as foremen, clerks, superintendents, overseers, and engineers in the works themselves. And they prove, moreover, a most important doctrine for us, that there is a kind of education which, instead of putting a workman above his work, enables him to do it more to the satisfaction of his employer, and to his own honour, and better for his own personal advancement. The nature of the instruction given in the school is shown in a series of detailed tables now hung on the walls of the Paris Exhibition. These tables comprise the organization of the schools, the programme of subjects taught, distribution of the pupils' time, samples of their mechanical and mathematical drawings, samples of their hand and eye sketches, examples of writing and French composition, lists of their studies in religion, sacred history, French history, and geography; studies in arithmetic, algebra, elementary geometry, and descriptive geometry; specimens of ornamental writing and map drawing. These are for boys. But the girls are also well educated, with the difference that for plan drawing and geometry are substituted needlework and dressmaking. They are also taught book-keeping.

There is one point on which M. Schneider speaks almost with the air of an injured man: after his pupils have been trained in his schools and put through their apprenticeship in his works, they are coveted on all sides by other manufacturers, and stolen from him in large numbers. We are not sure that M. Schneider does not make this complaint with a quiet internal chuckle of self-complacency, that he not only manufactures good skilled artisans, but also finds them good masters. Seriously, we do not think M. Schneider is very sorry. We do not think that his giving us, his rivals, all this information looks very narrow-minded; and the candid way in which he lays before us on the walls of the Exhibition the cost price of his goods, the revenue he gets in return, and the mode in which that is expended in wages, materials, and the well-being of the community, suggests that he seeks his chief reward in the prosperity of his people and in the example which he offers for imitation to the world.

In conclusion we would venture to suggest to M. Schneider a very simple way in which he may add to the benefit which his gift to the Kensington Museum confers on the British community. A great deal of the most valuable information he gives consists in printed tables and engravings. Would he be kind enough to give a copy of each of these to the chambers of commerce or town councils of such manufacturing towns as Manchester, Birmingham, Leeds, Sheffield, Newcastle, and Glasgow? In this way he would enable the different classes of these communities to see, and judge between the two great principles of social organization—the one principle of every man for himself, and the other of every man for the general good. They would be enabled to see in the example of Cresset how combinations may be formed, not of one class against every other class, but of each for the benefit of all.

Fine Arts.

PRESENTATION OF WORKS OF ART TO PUBLIC ESTABLISHMENTS BY THE FRENCH GOVERNMENT.—The usual report of presentations of works of art by the Ministry of the Fine Arts on the occasion of the Imperial Fêtes, has just appeared, and is of unusual length; the recipients include churches and chapels in sixty-four departments of France, and in Algeria; the four great public libraries of Paris; the Senate, and the Corps Legislatif; the Council of State; the Institut; the Sorbonne; the Archives of the Empire; the Museum of Natural History; the Louvre; the Conservatoire des Arts et Metiers; seven Imperial and special schools; the Union Centrale of Applied Art;

the Imprimerie Impériale, and the Geographical Society; and more than two hundred museums, libraries, and scientific and artistic institutions in the provinces. The Minister of the Beaux Arts is a splendid customer to the artists of France.

Commerce.

MINERAL STATISTICS.—Mr. Robert Hunt, F.R.S., Keeper of Mining Records, has issued his "Mineral Statistics of the United Kingdom" for the year 1866. Sir Roderick Murchison, in the preface, draws attention to the remarkable increase in the production of coal during the past year, notwithstanding the depression in many manufactures, and especially in that of iron. It appears that the collieries of the United Kingdom produced, during the year, the enormous quantity of 101,000,000 tons of coal. The estimated value of that coal is £25,407,635. The quantity of iron raised in 1866 was 9,665,012 tons, which produced in metals, 4,523,897 tons; the estimated value of the raw material being £3,119,098, and of the manufactured £11,309,742. The following is a summary of the returns of coal produced in the various colliery districts of Great Britain and Ireland during the year 1866:—Durham and Northumberland, 25,194,550 tons; Cumberland, 1,490,481; Yorkshire, 9,714,700; Derbyshire, 4,750,520; Nottinghamshire, 1,600,560; Leicestershire, 866,560; Warwickshire, 775,000; Staffordshire and Worcestershire, 12,298,580; Lancashire, 12,320,500; Cheshire, 895,500; Shropshire, 1,220,700; Gloucestershire and Somersetshire, 1,850,700; Monmouthshire, 4,445,000; South Wales, 9,376,443; North Wales, 2,082,000; Scotland, 12,625,000; Ireland, 123,750. Total produce of the United Kingdom, 101,630,544 tons. This gives an increase of 3,479,957 tons in 1866 over the production of the previous year. In 1866 there were 2,815 collieries in England and Wales, and in 1866 there were 3,188. The quantity of iron ore produced in this country last year was 9,665,012 tons; about 300,000 tons less than the quantity returned in 1865. In the same period the quantity of pig iron made was 4,530,051 tons, or 289,203 tons less than the production of our blast furnaces in the previous year. The estimated value of iron ore raised in the United Kingdom amounted to £3,119,098 19s. 6d. Foreign ore imported, 56,689 tons; custom-house value, £49,081; making a total quantity of 9,721,701 tons converted into iron. The number of furnaces in blast were 618. Pig iron produced: In England, 2,576,928 tons; in Wales 959,123 tons; in Scotland, 994,000 tons. Total production of pig iron in Great Britain, 4,530,051 tons. This quantity, estimated at the mean average cost at the place of production, would have a value of £11,309,742.

Colonies.

AUSTRALIAN VINE-GROWING.—The following are the yields of some of the principal vineyards in the western districts of Victoria, in 1867, compared with the yield of the same vineyards in 1866:—

		1866.	1867.
Guarwarra ..	11 acres ..	5 hhd. ..	22 hhd.
" ..	16 " ..	1,600 galls. ..	1,600 galls.
" ..	6 " ..	" ..	1,000 "
Ceres	8 " ..	1,200 " ..	2,000 "
Duned	16 " ..	3,000* " ..	—
Frogmore ..	4 " ..	21 hhd. ..	—
Moorabool ..	20 " ..	2,500 galls. ..	7,000 "

On a whole showing a decrease in the yield, which was caused by dry winds and weather in the early part of the season, and by wet weather lately causing the grapes to burst.

* And sold 25 tons of grapes.

Notes.

SEWERAGE OF PARIS.—A very important work has been some time under hand in the western portion of the city, namely, a second great *égout collecteur*, the object of which is to prevent the contamination of the whole horse-shoe bend of the Seine which encloses the Bois de Boulogne. The new main drain commences at the Place de l'Alma, nearly opposite the Exhibition, and will terminate at Neuilly, a distance of between three and four miles. The work is being performed by tunneling, and by means of shafts 60 to 80 feet deep, and 150 feet apart. This sewer will carry the drainage of the left bank of the Seine, after it has crossed the river by means of a syphon, to a spot just below the island of Neuilly, and thus probably keep out impurities from the Seine for a distance of nine or ten miles, the bend of the river being very sharp in this part; it will also serve to convey away the water of a very dirty little stream, called the Bièvre.

Correspondence.

ARTIZANS' VISITS TO PARIS.—SIR,—Permit me, through the columns of the *Journal*, to express my views as to the admirable arrangements made by the British Commission to aid the inquiries and add to the comfort of artizans visiting the Paris International Exhibition, now open. At the request of the Birmingham Chamber of Commerce, I accompanied 25 representatives of the industries of Birmingham sent by the Society of Arts, and my experience is that no means was spared by those in attendance at the British Workmen's Hall to render the object and intentions of the visit practically useful. The indefatigable exertions of Mons. Haussoullier secured for the Birmingham representatives admission to the leading establishments engaged in the production of works in the precious metals, bronzes, gas-fittings, plumbers' work, brass founding, railway carriages, the mint, die-sinking, gun-making, tin and copper working, jannping, and galvano-plastic works. Moreover, through the introductions given by him, the artizan visitors were also provided with intelligent guides and interpreters, who became the medium of communication through which questions were asked and answers received. The Workmen's Hall serves also the purpose of a reading room, the tables being covered with English and other papers, periodicals, literary and scientific, and reports on the trades of Paris. On the walls are hung carefully-prepared lists of places, with the days and conditions under which they may be visited; pens and ink afford the means of letter-writing. Altogether the arrangements of the British Workmen's Hall are of the most satisfactory and efficient kind; it is a place of meeting—a quiet retreat for a few minutes from the bustle and heat of the interior of the Exhibition building. Having for ten days been a daily witness to the useful and efficient working of the arrangements in the British Workmen's Hall, and the untiring courtesies and labours of Mons. Haussoullier, in whose care the British Commission have placed the hall, I have much pleasure in bearing my testimony on the subject. Trusting you will give this a corner in your *Journal*, I am, &c., W. C. AITKEN.

Birmingham, September 11, 1867.

Journal of the Society of Arts.

FRIDAY, SEPTEMBER 20, 1867.

Announcements by the Council.

ARTIZANS' VISITS TO PARIS.

Her Majesty's Government have transmitted to the Society of Arts, in aid of the fund raised by the Society for assisting workmen, specially selected from various trades, to visit and report on the Paris Exhibition, the sum of £500, which was granted conditionally on the Society raising a like amount by public subscription.

The amount received up to the present time is as follows:—

H.R.H. THE PRINCE OF WALES,				
President	£31	10	0	} £518 14 0
Society of Arts	105	0	0	
Other Subscriptions ..	382	4	0	
HER MAJESTY'S GOVERNMENT..			500 0 0	
Total			£1,018 14 0	

Subscriptions may be forwarded to the Financial Officer, at the Society's House.

The following workmen have already been selected, and many of them are now in Paris:—

Proceedings of the Society.

MEMORIAL TABLETS OF GREAT MEN AND EVENTS.

Tablets to the memory of illustrious men have now been placed in the following situations in London:—

Lord Byron.—24, Holles-street, Cavendish-square.
Napoleon III.—3A, King-street, St. James's.

Whilst the Council intend proceeding with this work, they desire also to see it carried on by others—either by corporate bodies or individuals—and the Council will be happy to be instrumental in procuring suitable tablets from the manufacturers. It is hardly necessary to repeat how greatly the interest of the metropolis would be increased thereby.

In order to show how rich the metropolis is

in the memory of important personages and events, which it would be desirable to mark by means of tablets on houses, the Council have caused an alphabetical list to be prepared, the first part of which is now inserted. Other parts will follow. The Council request the assistance of members of the Society in completing and correcting this list, especially with reference to dates and the insertion of other names.

*A'Becket, Thomas (b. 1117—d. 1170).—Was born in a house which stood on the site of Mercer's Chapel. Abernethy, John, the great surgeon. Lived at No. 14, Bedford-row, Bloomsbury.

Abington, Mary, sister of Lord Mountague. She wrote the famous letter which led to the discovery of the Gunpowder Plot. Abington-street, Westminster, near old Palace-yard, takes its name from her.

Abington, Frances, celebrated actress (b. 1785—d. 1815); lived at 19, Eaton-square, Grosvenor-place, in 1807; a portrait of her hangs at the Garrick Club.

Adam, Robert, architect; built the Adelphi, over the ground on which old Durham-house stood; also the screen in front of the Admiralty; Mansfield-street; Portland-place, Regent's-park, &c.

Addison, Joseph, the poet (b. 1672—d. 1719); educated at Charter-house; frequented Button's coffee-house, which stood on the south side of Russell-street; also St. James's coffee-house, St. James's-street (no longer standing). His "Campaign" he wrote in an attic, at the top of a small shop in the Haymarket. In 1710 he lived in St. James's-place, St. James's-street, and after his marriage with Lady Warwick, at Holland-house, in Kensington. Here his death-bed interview took place with the young and profligate Earl of Warwick, by which he hoped to show him how a Christian can die. His "Cato" was performed at Leicester-house, Leicester-square, by the junior members of the Royal family, and Prince George, afterwards George III. played the part of Portius. He was buried, and a monument was erected to his memory, in Westminster Abbey.

Ainsworth, Robert, (b. 1660—d. 1743) kept an academy at Bethnal-green; author of the Latin Dictionary.

Akenside, Mark, author of the "Pleasures of Imagination." At Tom's coffee-house, Devereux-court, Strand, he, Dr. Birch, and others, spent their winter evenings. He resided in Bloomsbury-square, also in Old Burlington-street, where he died, June 23rd, 1770, and was buried in St. James's churchyard.

Alexander, Sir W., Earl of Stirling, the poet; lived in St. Martin's-lane from 1631 to 1632, and in Drury-lane 1634—1637, and in the north-west angle of the Piazza, Covent-garden.

Alleyne, Edward (b. 1566—d. 1626), celebrated actor and philanthropist; baptised at St. Botolph, Bishopsgate Without; lived "hard by the chapel chynke by the banksyde neere Wynchester-house." He built and endowed almshouses in Lamb-alley, Bishopsgate-street, in Bath-street, Old-street, St. Luke's, and in Soap-yard, Deadman's-place, Southwark, about 1620. He also founded Dulwich College in 1619. He acted at the Fortune Theatre, Peter-street, and also at the Paris Garden Theatre in Southwark; he was also one of the last masters of the Bear-garden to Queen Elizabeth and James I.; also lord of the manor of Kennington. His portrait hangs at Dulwich College.

Anderson, Adam (d. 1765), author of the "History of Commerce;" was forty years a clerk in the South Sea House.

Anderson, Dr. Patrick, physician to Charles I.; his pills are very celebrated, and are now sold at Beak's Strand, Inglis's Warehouse; in 1699 they were set against the "Golden Unicorn," over against the "Maypole" in the Strand. Tom Brown says, "There are as many half-a-score of pretenders to Anderson's Scotch pills, and the Lord knows who has the true preparation."

Anglesea, Marquis of. Uxbridge-house, Berkeleys-gardens, is the Town-house of this nobleman, it was built by Vardy (1792) on the site of Queensbury-house.

Anglesea, Earl of (Arthur Annesley, (b. 1614—d. 1684) Lord Privy Seal from 1669 to his death; he lived in doors from John Lacy, the comedian, in Drury-lane. Apsley, Sir Allan, (d. 1630) falconer to Charles II.; lieutenant of the Tower; maternal grandfather of the first Earl of Bathurst; lived for many years in a house in St. James's-square; in this house the Duke of York afterwards James II., slept the first night of his reign, and unexpected return from Brussels. A monument stands to Sir Allan in the chancel of St. Peter's Vincla in the Tower of London.

Argyll, Marquis of, (d. 1661), the first celebrated Marquis of the Scotch Covenant; was married, in 1609, to a Cornwallis, daughter of Sir William Cornwallis, in the Bishop's Church, Bishopsgate-street-without; lived from 1634 to 1637 in Drury-lane, and was headed in 1661.

Argyle and Greenwich, Duke of, (d. 1734), lived in Kenton-street;—

"Yes on the great Argyle I often wait
At charming Ludbrook or in Bruton-street."
—(Sir Charles Hanbury Williams' Poems, 1768, p. 54.)

Argyle, Dukes of, lived in Argyle-street, Regent-street; this was originally their town-house, but was purchased some years ago by the Earl of Aberdeen. It has since been pulled down.

Arlington, Henry B. Earl of, (b. 1618—d. 1685), one of the members of the celebrated Cabal; his town-house was Arlington-house, St. James's-park.

Armstrong, Dr. J., (b. 1709—d. 1779), poet, author of "Art of Preserving Health;" lived and died at Russell-street, Covent-garden; he is buried in St. Paul's Covent-garden, in a vault under the communion-table. A portrait of him, by Sir Joshua Reynolds, hangs in a room at the banking-house of Messrs. Coutts, No. 1, Strand.

Arundel, Earl of, Thomas Howard, (d. 1646), the "marvellous" Earl and a great collector of art and antiquities; lived in 1619-20, in Castle-yard, Holborn; his Countess Alatheia, had Tart-hall built for her, outside St. James's park, near Buckingham-palace.

Arundel, Earl of, Henry Fitzallan (d. 1579); he purchased Arundel-house, in the Strand, with other messuages for £41 6s. 8d.; he lived and died here. This was his town-house of the earls for some time.

Ashburnham, Jack, (b. 1603—d. 1671), was inseparably connected with the misfortunes of Charles I.; lived in Ashburnham-house, Little Dean's-yard, Westminster.

Ashmole, Elias, (b. 1617—d. 1692), founder of the Ashmolean Museum, Oxford; married the daughter of Sir William Dugdale, 3rd Nov., 1668, at Lincoln's Inn Chapel, Lincoln's Inn; he lived at Middle Temple-lane, and also in Ship-yard, Temple-bar. A marble slab is erected to his memory at St. Mary's Church, Lambeth.

Astley, John, (d. 1787), the artist; lived at Schomberg House, Pall Mall.

Astley, Philip, (b. 1742—d. 1814), the originator of Astley's Amphitheatre; he had been a light horseman in the 15th or General Eliott's regiment, and was said to be the handsomest man in England; his first equestrian performance was at the "Halfpenny Hatch," a house between Lambeth and the Waterloo-road; he afterwards built the Olympic Theatre, in 1804, on the garden ground of Old Craven-house.

Atterbury, Francis, Bishop of Rochester, (b. 1683—d. 1772), educated at Westminster school; when a young

* The facts in these notices have been chiefly extracted from Peter Cunningham's "Handbook of London," by permission of Mr. Murray, the publisher. Other works consulted have been Pennant's "History of London," Hone's "Every-day Book," Timbs's "Walks and Talks about London," &c., &c.

- man, he was minister and preacher of Bridewell; lived in Church-lane, Chelsea, was Dean of Westminster and preacher of the Rolls; confined in the Tower, 1722, and died in banishment, but his remains rest in Westminster Abbey.
- Aubrey, John, (b. 1625—d. 1697), the celebrated antiquary; lived at Mr. H. Coley's house in Rose and Crown-court, Gray's Inn-lane, 1672.
- Aylesbury, Earls of; their town house was Aylesbury-house, Clerkenwell, the site of the present Aylesbury-street.
- Ayton, Sir Robert, (b. 1570—1638), the poet; was appointed master of St. Katherine's, at the Tower, by Queen Henrietta Maria; he is buried in Westminster Abbey.
- Babington, Antony (d. 1586), the conspirator, concealed himself in St. John's-wood. He was executed at St. Giles's-in-the-fields, Lincoln's-inn-fields, in 1586.
- Bacon, Antony, brother to Francis Bacon; lived in Bishopsgate-street, near the Bull Inn.
- Bacon, Lord F. (b. 1561—d. 1626), Lord High Chancellor, author, &c.; born at York-house, in the Strand; baptised in St. Martin's-in-the-fields; dates the dedication of his essays, "from my chamber at Gray's Inn," January 30, 1597.
- Bacon, John (b. 1740—d. 1799), sculptor; lived at 17, New-man-street, from 1777 to his death, 1799; buried in Whitfield's Chapel, Tottenham-court-road; monument to him there.
- Bacon, Sir Nicholas, Lord Keeper of the Great Seal, (b. 1510—d. 1579), lived at Bacon-house, in a street off Cheapside; founder of Curator's office or inn, Chancery-lane; died at York-house. Monument preserved in the crypt of St. Paul's Cathedral.
- Bagford, John (b. 1651—d. 1716), co-projector of the society of antiquaries, 1707; was born in Fetter-lane; lived at Turnstile, first as a shoemaker and then as a bookseller. Died in the Charter-house.
- Baillie, Matthew, M.D. (b. 1761—d. 1823); lived at 72, Lower Grosvenor-street; also at 35, Cavendish-square, where he died; bust of him at the College of Physicians.
- Baily, Francis, (b. 1774—d. 1844), President of the Royal Astronomical Society; lived at 97, Tavistock-place, Tavistock-square, from 1825 to 1844. Portrait of him in the Council-room of the Royal Astronomical Society, Somerset-house.
- Baker, (b. 1568—d. 1644-5), author of the "Chronicles of the Kings of England;" lived from 1632 to 1639 in Milford-lane, Strand; imprisoned in the Fleet Prison. Died there. Buried at St. Bride's or St. Bridget's, Fleet-street.
- Balmerino, Arthur Elphinstone, Lord (b. 1686—d. 1746); lived at Rathbone-place; imprisoned in the Tower of London; tried at Westminster Hall; beheaded on Tower-hill, August 18th, 1746. Buried at St. Peter's ad vincula, in the Tower.
- Banks, Thomas, R.A. (b. 1735—d. 1805), sculptor; born in Lambeth. Lived at No. 5, Newman-street, from 1781 to his death, 1805. Buried at Paddington Church.
- Bannister, John (b. 1760—d. 1836), actor, lived at 65, Gower-street, Bedford-square; made his first appearance at the Haymarket Theatre.
- Barebones, "Praise God Barebones," lived in Fleet-street. He was a leatherseller, and owner of a house called "The Lock and Key," in the parish of St. Dunstan in the West.
- Barham, Rev. Richard Harris (Thomas Ingoldsby), died rector of the united parishes of St. Augustine's, Watling-street, and St. Faith under St. Paul's.
- Barker, Robert (d. 1806); built the Panorama in Leicester-square, and invented the species of exhibition which gives its name to the building. The building was pulled down some years ago.
- Barker, Thos., painter; lived at 20, Brook-street, Grosvenor-square.
- Barnard, Lady Anne, (d. 1825); lived and died in 21, Berkeley-square; authoress of "Auld Robin Gray."
- Barnes, Thos. (b. 1785—d. 1841), editor of *The Times*; educated at Christ's Hospital; buried at Kensal-green.
- Barrow, Isaac, (b. 1630—d. 1677), divine; lived at Charing-cross; also, in 1761, in Pall Mall, the west-end of the south side; educated at Charter-house; lecturer at Gresham College; buried in Westminster Abbey. There is a bust of him there.
- Barry, James Richard (b. 1741—d. 1806), painter; painted the series of allegorical pictures for the Great Room of the Society of Arts; lived at 36, Castle-street, Oxford-market; lived also at 29, Suffolk-street, Haymarket, between the years 1773 and 1776; died at 76, Great Titchfield-street, Marylebone, the house of Mr. Bonomi; buried in St. Paul's Cathedral.
- Barry, Spranger, actor; lived in the corner house on the west side of Bond-street, formerly Will's coffee-house.
- Bathoe, bookseller; established, in 1740, the first circulating library in London; his shop was at 132, Strand.
- Bathurst, Henry, Baron Apsley, (b. 1708—d. 1794), built Apsley-house; lived in St. James's-square.
- Baxter, Richard, (b. 1615—d. 1691), the nonconformist divine; lived in Bloomsbury-square; preached in a room over St. James's Market-house, Jernyn-street; built a chapel in Oxenden-street, Coventry-street, Haymarket, and in order to drive him from it, Secretary Coventry ordered the king's drums to be beaten under the window to drown his voice; he was confined in the King's Bench, and buried in Christchurch, Newgate-street.
- Beattie, James, Dr., (b. 1735—d. 1803), author of "The Minstrel;" lodged at 64, Wells-street, Oxford-street in the year 1771.
- Beaumont, Francis, (b. 1586—d. 1615), dramatist; lived at the Inner Temple; buried in Westminster Abbey.
- Beaumont, Sir George Howland, (b. 1753—d. 1827); lived at 29, Grosvenor-square; gave, in 1826, sixteen pictures to the National Gallery, valued at 7,500 guineas.
- Beckford, William, (b. 1760—d. 1844), author of "Vathek;" lived in a house (now Cockerell's), in Piccadilly; also at No. 4, Devonshire-place, in 1810.
- Bedford, Francis, Earl of (d. 1641); formed Covent-garden-square (circ. 1631); also St. Paul's, Covent-garden.
- Beloe, W. (b. 1757—d. 1817) translator of Herodotus, and divine, lived in Brompton; rector of All Hallows-in-the-Wall.
- Bentham, Jeremy (b. 1747-8—d. 1832), author and lawyer; designed the Millbank Prison; lived and died in Queen-square, Westminster.
- Bentley, Richard (b. 1662—d. 1742), critic and divine; lived at Ashburnham-house, Little Dean's-yard and Cloisters, Westminster Abbey, now a prebendal house; also in Park-street, Westminster.
- Berkeley, George, Bishop of Cloyne (b. 1684—d. 1743), author and divine; lived in Albemarle-street in 1724, also in Piccadilly.
- Berkeley, Stratton John, Lord (d. 1678), hero of Stratton fight, during the civil war in Charles I. time; lived in Berkeley-house, Piccadilly, now Devonshire-house.
- Bertie, Robert, first Earl of Lindsey (d. 1642), general of the King's forces at the outbreak of the civil war under Charles I. He lived at Lindsey-house, No. 59 on the western side of Lincoln's-inn-fields, and also at Lindsey-house, Chelsea, which he rebuilt.
- Betterton, Thomas (b. 1635—d. 1710), actor, lived in Salisbury-court, Fleet-street, and also at Russell-street, Covent-garden, where he died. He was buried in Westminster Abbey.
- Bill, John (temp. Charles II.), King's printer, lived in Printing House-square, Blackfriars. He was the printer of the proclamations of the reign of Charles II., and of the first *London Gazette*.
- Birch, Dr. Thomas (b. 1705—d. 1766), historical and biographical writer, frequented Tom's coffee-house. He lived in the last house on the south-west side of Norfolk-

- street, Strand, called Penn's house. Buried at St. Margaret's Pattens.
- Birkbeck, Geo., M.D. (b. 1776—d. 1841); founded the London Mechanics' Institute; buried at Kensal-green.
- Blackmore, Sir Richard (b. 1650—d. 1729), poet, followed the profession of a physician at 142, Cheapside, next door to Sadler's-hall.
- Blackstone, Sir William (b. 1723—d. 1780), the great lawyer; lived in No. 2, Brick-court, Middle Temple, on the first floor; educated at Charter-house; was a Templar.
- Blake, William (b. 1757—d. 1828), artist and engraver; lived at No. 3 in Fountain-court, Strand; also at 17, South Molton-street, New Bond-street; buried in Bunhill-fields burial ground.
- Bloomfield, Robert (b. 1766—d. 1823), poet, originally a shoemaker; lived at 149, Great Bell-yard, in Coleman-street.
- Bolingbroke, Henry, Viscount St. John (b. 1678—d. 1751); lived at Battersea; and also, when Secretary of War, in Golden-square, Regent's-quadrant.
- Bond, Sir Thomas; began to build Albemarle-street, Piccadilly (circ. 1684); was comptroller of the household to Queen Henrietta Maria. Old Bond-street is named after him.
- Bone, Henry, R.A., the enameller (b. 1755—d. 1834); lived at No. 15, Berner's-street, Oxford-street.
- Bonner, Edmund, Bishop of London (d. 1669); lived at Bishop's Hall, Bethnal-green, now pulled down; Bonner's-fields, close by, named after him; was afterwards imprisoned in the Marshalsea, Southwark, where he died, and was buried at night, with other prisoners, at St. George the Martyr's.
- Booth, Barton, actor (b. 1681—d. 1733); lived and died at his house in Charles-street, Covent-garden. He was the original *Cato* in Addison's play. Barton-street, Westminster, is named after him.
- Boscawen, Admiral (b. 1711—d. 1761); lived and died in No. 2, St. James'-square. The iron posts in front of this house are some guns he took from the French off Cape Finisterre.
- Boswell, James, biographer of Dr. Johnson; lived at the chambers of the Rev. Mr. Temple, Farrar's-buildings, at the bottom of Inner Temple-lane. On the 16th of October, 1769, he gave a dinner to Dr. Johnson, Reynolds, Goldsmith, and Garrick, at his lodgings in Old Bond-street. He and Dr. Johnson occasionally supped at the Crown and Anchor Tavern, in the Strand (now the Whittington Club); also at the Mitre Tavern, Mitre-court, Fleet-street. He died at No. 47, Great Portland-street.
- Bouchier, Elizabeth; married, 20th August, 1620, to Oliver Cromwell, aged 21, at St. Giles, Cripplegate.
- Bourgeois, Sir Francis, R.A. (b. 1756—d. 1811); founder of the Dulwich Gallery.
- Boydell, John (b. 1719—d. 1804); lived and had his shop at No. 90, Cheapside, corner of Ironmonger-lane. He built the British Institution, Pall-mall, to contain the pictures composing his celebrated Shakespeare Gallery. Was buried at St. Olave's, Jewry. His portrait hangs at the Stationers' Hall.
- Boyle, Hon. Robt. (b. 1626—d. 1691); lived in Pall-mall, next to Sir W. Temple; one of the early members of the Royal Society.
- Boyce, Sam., the poet (b. 1708—d. 1749); lived at a sponging house in Grocer's-alley.
- Britton, Thos., the musical small-coal man (d. 1714). He was the first to establish any assembly deserving the name of a concert in London; and he held the celebrated music meetings, from 1678 till his death, in 1714, over his repository for small coal, at the corner of Aylesbury-street, Clerkenwell. The room was long and narrow, and a tall man could not stand upright, but it was attended weekly by all ranks from the highest to the lowest.
- Brook, Lord; lived in Hanover-square, about 1720. One of the first inhabitants.
- Brooke, Fulke Greville, Lord (b. 1554—d. 1628); lived in Austin Friars. His residence, Brooke-house, stood on the site of Greville-street, which is named after him. In this house he was assassinated by his servant, Sept. 1st, 1628.
- Bunyan, John (b. 1628—d. 1688), author of "Pilgrim's Progress;" died at the house of his friend, Mr. Sturdivick, a grocer, at the sign of the Star, on Snow-hill; buried in Mr. Sturdivick's vault, in Bunhill-fields burial-ground.
- Burbridge, Richard (b. 1618-20), actor; joint-tenant with Shakespeare of the Blackfriars Theatre; lived and died in Holywell-street, Shoreditch.
- Burdett, Sir Francis (b. 1770—d. 1844), lived at 25, St. James's-place; imprisoned in the Tower.
- Burke, Edmund (b. 1730—d. 1797), orator and historian; a Templar; lived in Charles-street, St. James's-square, also in Gerard-street, Soho (house unknown).
- Burlington, Richard Boyle, 3rd Earl of (b. 1695—d. 1753), lived at Burlington House.
- Burnet, Gilbert, Bishop of Salisbury (b. 1643—d. 1715), lived and died in Soho-square; lived also in St. John's-square; the shell of this house is still standing.
- Burney, Dr. Charles (b. 1726—d. 1815), author of the "History of Music;" a member of the Literary Club; lived in St. Martin's-street, Leicester-square; also in Poland-street, Oxford-street.
- Burney, Fanny (b. 1752—d. 1840), authoress; lived in Halfmoon-street, Piccadilly, in the last house on the east side, overlooking Piccadilly; now a turner's shop; also in St. Martin's-street, Leicester-square, at her father's (Dr. Charles Burney's) house; here she wrote her novel of "Evelina."
- Byron, George Gordon, Lord, poet; he was born at 24, Holles-street, Cavendish-square; lived in the Albany, Piccadilly, in set No. 2 A; here he wrote his "Lara," in 1811; he had lodgings at No. 8, St. James's-street. The London season of his married life was passed in that half of the Duke of Queensbury's house which is now No. 139, Piccadilly. He lay in state for two days at 25, Great George-street, Westminster.
- Cademan, Will. (temp. Chas. II.), player and play publisher. In 1674 he lived at the sign of the "Fop's Head," New Exchange, Strand.
- Cadell, Thos. (d. 1802), publisher; published the first and many consecutive editions of Gibbon's "Decline and Fall of the Roman Empire;" lived at a house standing on the site of the present 141, Strand, and died at No. 4, Bloomsbury-place, Bloomsbury-square.
- Caius, Dr. John (b. 1610—d. 1673), founder of Caius College, Cambridge; lived in Bartholomew-close.
- Camden, Wm. (b. 1551—d. 1623), the antiquary, &c.; born in the Old Bailey; educated at Christ's Hospital, clarencieux of the Herald's College; master of Westminster School; Camden-town named after him. Buried and monument erected to him in Westminster Abbey.
- Camden, Ch. Pratt, Earl (b. 1713—d. 1794), Lord Chief Justice and Lord Chancellor; lived and died in Hill-street, Berkeley-square.
- Camelford, Thos. Pitt, Lord (b. 1775—d. 1804); the duellist; lived in 1800 at No. 64, Baker-street, Portman-square; also in 1803-1804, at 148, New Bond-street; in 1804, at the Prince of Wales coffee-house, in Conduit-street. He quarrelled with Mr. Best, who killed him in a duel the next day, March 7th, 1804, in the grounds behind Holland-house.
- Campbell, John, LL.D. (b. 1708—d. 1775), author of the "Lives of the Admirals," and editor of the "Biographia Britannica;" lived in Queen's-square, Bloomsbury. He is buried in St. George the Martyr, Queen's-square, Bloomsbury.
- Campbell, John, Lord; law student in Lincoln's-inn.
- Campbell, Thos. (b. 1777—d. 1844), poet; author of the "Pleasures of Hope;" one of the founders of the University College, London. He lived at 30, Foley-place,

- Regent-street; also at No. 10, Upper Seymour-street West, where he lost his wife; he was married at St. Margaret's, Westminster; his last London residence was at No. 8, Victoria-square, Pimlico. Buried and a monument erected to him in Westminster Abbey.
- Camden, Baptiste Hicks, Viscount (d. 1609), built Hick's Hall at his own expense; lived at Camden House; Camden-hill, Kensington, named after him; he was a mercer, at the sign of the White Bear, at Soper-lane, in Cheapside.
- Canning, George (b. 1770—d. 1827), statesman; lived in No. 5A, The Albany; also for some years at No. 35, Conduit-street, Bond-street (now Dr. Elliotson's); was a student in Lincoln's-inn; also resided in 1800 at No. 13, Spur-alley. He was buried and a statue erected to his memory in Westminster Abbey.
- Capel, Sir Wm., Lord Mayor (d. 1503-4); lived at the end of Capel-court, Bartholomew-lane, on the site of the Stock Exchange.
- Cardigan, Lord (d. circ. 1668); lived in Portugal-row, now south side of Lincoln's-inn-fields.
- Carey, Henry (b. 1692—d. 1743), author of the song "Sally in our Alley;" lived in Dorrington-street, Coldbath-fields. Died by his own hand, in Warner-street, Coldbath-fields.
- Carew, Thos. (b. 1589—d. 1639); lived in the Strand.
- Carlisle, Ch. Havard, 1st Earl of (b. 1618—d. 1684); lived in Newport-street, Long-acre.
- Carlisle, Lucy Percy, Countess of (d. 1660), "The Beautiful Countess;" lived in the Strand, near Exeter House.
- Carlton, Henry Boyle, Baron (d. 1725); built and lived in Carlton-house, Pall-mall; no longer standing, though the name is perpetuated in Carlton-house-terrace, Carlton-gardens, and the Carlton Club.
- Caron, Sir Noel de (d. 1624-5), founded a row of seven almshouses for poor women near the Vauxhall turnpike.
- Carpenter, George, Lord (b. 1657—d. 1731), one of the first inhabitants of Hanover-square.
- Carr, Sir John (d. 1772), author of the "Caledonian Sketches;" lived in No. 2, Garden-court, Temple.
- Carte, Thos. (b. 1686—d. 1754), historian; lived at Mr. Ker's, at the Golden Head, in Newport-street, Long-acre.
- Carter, Elizabeth (b. 1717—d. 1806); lived and died in Clarges-street, Piccadilly.
- Cartet, John, Lord and Earl of Granville (b. 1690—d. 1763); lived in the last house on the Green-park side, in Arlington-street, Piccadilly.
- Cary, Henry, Earl of Monmouth (d. 1626), historian; Monmouth-street, St. Giles's, named after him and his son, who lived in the neighbourhood.
- Castlemaine, Roger Palmer, Earl of (d. 1705); lived in 1668 in Berkshire-house, St. James's.

Proceedings of Institutions.

EXAMINATION PAPERS, 1867.

The following are the Examination papers set in the various subjects at the Final Examination held in April last:—

(Continued from page 659.)

ITALIAN.

THREE HOURS ALLOWED.

Candidates for a first-class certificate must translate the following passages (poetry and prose), and answer the grammatical questions annexed to them:—

Spesso in poveri alberghi e in picciol tetti,
Nelle calamitadi e nei disagi,
Meglio s'aggiungon d'amicizia i petti,
Che fra ricchezze invidiose ed agi

Delle piene d'insidie e di sospetti
Corti regali, e splendidi palagi,
Ove la caritate è in tutto estinta,
Nè si vede amicizia, se non finta.

Quindi avvien che tra principi e signori
Patti e convenzion sono sì frali.
Fan lega oggi re, papi e imperatori;
Doman saran nemici capitali:
Perchè, qual l'apparenze esteriori,
Non hanno i cor, non han gli animi tali;
Chè, non mirando al torto più ch' al dritto,
Attendon solamente al lor profitto.

Questi, quantunque d'amicizia poco
Sieno capaci, perchè non sta quella
Ove per cose gravi, ove per gioco
Mai senza finzion non si favella;
Pur, se talor ha tratti in umil loco
Insieme una fortuna acerba e fella,
In poco tempo vengono a notizia
(Quel che in molto non fer) dell' amicizia.

(ARIOSTO, Orlando Furioso.)

Incomincio racconto più mesto: la miseria degli abitanti. Al primo tremuoto del 5 di febbraio quanti erano dentro le case della Piana morirono, fuorchè i rimasti mal vivi sotto casuali ripari di travi o di altre moli che nelle cadute incarcarono: fortunati, se in tempo dissepolti; ma tristissimi se consumarono per digiuno l'ultima vita. Coloro che per caso stavano allo scoperto furono salvi, e nemen tutti; altri rapiti nelle voragini che sotto ai piedi si aprivano, altri nel mare dalle onde che tornavano, altri colti dalle materie proiettate dal turbine, infelicitissimi i rimanenti, che miravano rovinato le case, e soggiacenti la moglie, il padre, i figliuoli. E poichè, anni dopo, io stesso ragionai co' testimoni della catastrofe e con uomini e donne tratti dalle rovine, potrò, quanto comporta l'animo e l'ingegno, rappresentare le cose morali de' tremuoti delle Calabrie, come finora ho descritto più facilmente le parti fisiche e materiali.

Alla prima scossa nessun segnale in terra o in cielo dava timore o sospetto; ma nel moto ed alla vista dei precipizi, lo sbalordimento invase tutti gli animi, così che, smarrita la ragione e perfino sospeso l'istinto di salvezza, restarono gli uomini attoniti ed immoti. Ritorata la ragione, fu primo sentimento de' campati certa gioia di parziale ventura, ma gioia fugace perchè subito fu oppresso il pensiero della famiglia perduta, della casa distrutta; e fra tante specie presenti di morire, e il timore di giorno estremo e vicino più gli straziava il sospetto che i parenti stessero ancora vivi sotto le rovine, sì che, vista l'impossibilità di soccorrerli, dovevano sperare (consolazione misera e tremenda) che fossero estinti. Quanti si vedevano padri e mariti aggirarsi fra i rottami che coprivano le care persone, non bastare a muovere quelle moli, cercare invano aiuto ai passeggiatori; e alfine disperati gemere di e notte sopra quei sassi. Nel quale abbandono de' mortali rifuggendo alla fede, votarono sacre offerte alla divinità, e vita futura di contrizione e di penitenza; fu santificato nella settimana il mercoledì, e nell'anno il 5 di febbraio; ne' quali giorni, per volontari martiri e per solenni feste di chiesa speravano placare l'ira di Dio.

(COLLETTA, Storia del Regno di Napoli.)

GRAMMATICAL NOTES FROM ARIOSTO.

1. *Estinta*: Give the infinitive and the whole present tense of the indicative.
2. *Vede*: This verb has three different forms for the first person singular of this tense. Give them.
3. *Attendon*: Write the whole of the preterite tense.
4. *Questi*: Here stands for the plural of *questo*. What other meaning has this word?
5. *Sieno*: How may this verb be otherwise written?
6. *Tratti*: Write the first person singular of the present, preterite, and future.
7. *Fer*: Give the other forms of this word.

GRAMMATICAL NOTES FROM COLLETTA.

1. *Moriròno* : Give the whole present tense of the indicative.
2. *Rimasti* : Give the whole present and future tense.
3. *Dissepolti* : Give the whole present tense of the indicative.
4. *Colti* : Give the two infinitives of this.
5. *Ritornata* : What auxiliary verb, and in what mood, is here understood in the sentence?
6. *Muovere* : Give the whole of the preterite tense.

Translate into Italian :—

"And this," said he, putting the remains of a crust into his wallet, "and this should have been thy portion, hadst thou been alive to have shared it with me." I thought, by the accent, it had been an apostrophe to his child, but it was to his ass; and to the very ass we had seen dead on the road, which had occasioned La Fleur's misadventure. The man seemed to lament it much; and it instantly brought into my mind Sancho's lamentation for his; but he did it with more true touches of nature. The simplicity of his grief drew numbers about him, and La Fleur among the rest. While the horses were getting ready, as I continued sitting in the post-chaise, I could see and hear over their heads. He said he had come last from Spain, where he had been from the farthest borders of Franconia; and had got so far on his return home when the ass died. Every one seemed desirous to know what business could have taken so old and poor a man so far a journey from his own home. It had pleased Heaven, he said, to bless him with three sons, the finest lads in all Germany; but, having in one week lost two of them by the small-pox, and the youngest falling ill of the same distemper, he was afraid of being bereft of them all, and made a vow, if Heaven would not take him from him also, he would go in gratitude to St. Iago, in Spain. When the mourner got thus far in his story, he stopped, to pay nature her tribute, and wept bitterly. He said Heaven had accepted the conditions, and that he had set out from his cottage with this poor creature, who had been a patient partner of his journey; that it had eaten the same bread with him all the way, and was unto him as a friend.

(STERNE, The Dead Ass.)

ITALIAN IDIOMS.

(To be translated into their English equivalents.)

Andò a marito giovinetta.
Non siete mai all'ordine.
Mettemoci al coperto.
Mise mano alla spada.
Sono sempre sfaccendati.
Non mi darebbe il cuore d'ingannarlo.
Fatevi animo.
Gli volsi le spalle.
M'andò fallito il colpo.
Diè di piglio ad un bastone.
Le rispose con piglio severo.

Candidates for second or third-class certificates are required (1) to translate into English the following extracts, and (2) to answer the grammatical questions given below.

Manlio. A che vieni?

Attilia. A che vengo! Ah sino a quando

Con stupor della terra,
Con vergogna di Roma, in vil servaggio
Regolo ha da languir? Scorrono i giorni,
Gli anni giungono a Iustri, e non si pensa
Ch'ei vive in servitù. Qual suo delitto
Meritò da' Romani
Questo barbaro obbligo? Forse l'amore
Onde i figli e sè stesso
Alla patria pospose? Il grande, il giusto,
L'incorrotto suo cor? Il illustre forse
Sua povertà ne' sommi gradi? Ah come
Chi quest' aure respira
Può Regolo obbligar! Qual parte

Non vi parla di lui? Le vie? Per quel
Ei passò trionfante. Il Foro? A noi
Provvide leggi ivi dettò. Le mura
Ove accorre il senato? I suoi consighi
Là fabbricar più volte
La pubblica salvezza. Entra ne' tempi,
Ascendi, o Manlio, il Campidoglio, e dimmi
Chi gli adornò di tante
Insegne pellegrine
Puniche, siciliane e tarentine?
Questi, questi littori,
Ch'or precedono a te; questa, che cingi,
Porpora consolar, Regolo ancora
Ebbe altre volte intorno: ed or si lascia
Morir fra' ceppi? Ed or non ha per lui,
Che i pianti miei, ma senza pro venati?
Oh padre! Oh Roma! Oh cittadini ingrati!

(METASTASIO, Attilio Regolo)

Se m'è dato lo sperare mai pace, l'ho trovata. Lorenzo. Il parroco, il medico e tutti gli oculari di questo cantuccio della terra mi conoscono sin da picciullo e mi amano. Quantunque io viva fuggiasco, vengono tutti d'intorno quasi volessero maneggiar la mia generosa e selvatica. Per ora io lascio loro. Veramente non ho avuto tanto bene dagli uomini fidarmi così alle prime: ma quel menare la vita tiranno che freme e trema d'essere scannato a ogni minuto, mi pare un agonizzare in una morte est obbrobriosa. Io seggo con essi a mezzogiorno sotto il platano della chiesa leggendo loro le vite di Licurgo e di Iride. Domenica mi s'erano affollati intorno i contadini che, quantunque non comprendessero stavo ascoltandomi a bocca aperta. Credo che il desiderio di sapere e ridere la storia de' tempi sia figlio del nostro amor proprio, che vorrebbe illudersi e prolungare la vita unendoci agli uomini ed alle cose che non sono più, e facendole, sto per dire, di nostra proprietà. Ama la immaginazione di spaziarsi in secoli e di possedere un altro universo. Con che pazienza un vecchio lavoratore mi narrava stamattina la vita del parroco della villa viventi nella sua fanciullezza: descriveva i danni della tempesta di trentasette addietro, e i tempi dell'abbondanza, e quei dell'arrendimento il filo ogni tanto, ripigliandolo, e scembrandolo dell'infedeltà! Così mi riesce di dimenticarmi di vivo.

(UGO FOSCOLO, Ortis, Ultime Lettere)

GRAMMATICAL QUESTIONS.

1. Show, by a few suitable examples, how to express (in Italian) the comparative of equality, superiority, and inferiority respectively.
2. Give the precise meaning (in English) of the following augmentatives and diminutives:—*Ragazzo*, *libraio*, *cazzetta*, *giardinetto*, *caravalluccio*, *scrivin*, *grandicello*, *biancastro*, *carino*, *caruccio*.
3. Write the conjunctive personal pronouns in the dative and accusative, for the three persons singular and explain when they should precede and when follow the verb.
4. Write, with the conjunctive personal pronouns in their proper position, the persons given of the following verbs:—I saw her (*vedere*); he knows us (*conoscere*); speaking to her (*parlare*); listen to me (you) (*ascoltare*); do not believe (to) him (*credere*); they did it (*fare*); went to take them (*andare, prendere*); that I might do to them (*dire*); give me (thou) (*dare*).

(To be continued.)

PARIS EXHIBITION.

The number of visitors to the Exhibition has greatly increased again, as was to be expected from the religious and school vacations; the highest number seen during the last week was 71,415, and the lowest

38,000. The vintage has commenced in some parts of the country, and will generally be finished in the course of the present month, when another large body of provincial visitors will be enabled to visit Paris. The visit of the Emperor and Empress of Austria, which is announced for the 10th of October, will also have a beneficial effect on the Exhibition.

The price of tickets for the rest of the season has been reduced from forty to twenty francs, and the admission to the park, after six o'clock, from one franc to half that sum. Had this been done while the evenings were hot, it might possibly have had an effect upon the evening attendances, but the attempt to unite evening amusements with an industrial exhibition is generally regarded as a mistake; there has never been more than a sprinkling of visitors in the evening, and the few entertainments attempted have all, or very nearly all, been failures. The effect of the Exhibition on the amusements of the city has been most favourable, as an official return of the receipts of the Paris theatres clearly indicates; compared with the five months of last year, commencing with April, the present year shows an excess of £100,850, the totals being relatively 4,666,856f. and 7,188,096f. It is to be noted also that the increase did not commence till May, the previous month showing an absolute decline; so that April would seem to have been too early a month for opening the Exhibition, and this is the general opinion out of doors.

As regards the refreshment department, the establishments at the exhibition have, we understand, been successful or otherwise in proportion to the moderation of the charges; the *Restaurant Omnibus*, established for the benefit of the working classes, has furnished as many as 8,568 meals in one day, and possibly that is not the highest number.

The shows of grapes have commenced in the horticultural gardens annexed to the Exhibition. The first consisted chiefly of table grapes: there were only about eight exhibitors, but more than one of these contributed two hundred varieties, including the *Chasselas de Fontainebleau*, probably the finest grapes produced out of doors in Europe. The centre of production of these dessert grapes is Thomery, with a railway station on the Lyons line, about three miles beyond Fontainebleau, a most interesting spot, well worth a visit at the present season.

It is said that a committee has been formed at Berlin for the arrangement of a plan for a universal exhibition to be held in that city in the year 1872.

TECHNICAL EDUCATION IN AUSTRIA.

The following account of an important institution at Vienna appears in the *Engineer*:—

The Imperial Royal Polytechnic Institution at Vienna, the rules of which we give below, was established in 1816 for the object of promoting instruction in the practical sciences. At first it formed a kind of preparatory school for artisans, but has since been gradually extended, and improved into what may be termed a scientific university. Properly speaking this more dignified title is only due to it since October, 1865, when by imperial decree it was created a "Hochschule," power being given to it to grant diplomas, and the entire course of education being made strictly compulsory, whilst a higher scale of knowledge was demanded from students applying for admission. The fees paid by most of the students (the total number of whom averages 600 annually) amounting to only about £5 per annum, or say £9, including laboratory and drawing fees, &c. This Institution is to a considerable extent supported by the state, the management being conducted by a committee of professors, who annually elect from among themselves a president—the so-called "Rector" and nominal head of the institution. The salaries of the professors amount to respectively 1,800, 2,900, 3,400, and 3,900 florins per

annum. There are altogether twenty-six professors, three salaried "Docenten" (minor professors), ten unsalaried "Docenten," eight teachers of languages, stenography, sketching, and modelling, three "Adjunkten" (special assistants), and twenty-three assistants. An annual sum of 13,000 florins is given by the state for development and expenses of the twenty different laboratories and collections, of which 2,000 florins go to the laboratory for chemical technology, 1,250 florins to the laboratory for analytical and general chemistry, 1,600 florins to the engine building collection, and 1,600 florins to the mechanical technology collection. A special fact worth mentioning is that students passing all their examinations with "vorzug" (excellence) are exempt from military service. Besides, students liable to military service may, on passing a satisfactory examination on technical subjects before a military commission, enter as cadets instead of being compelled to serve as private soldiers. An exceedingly useful and altogether excellent system is embodied in the so-called scientific excursions made at certain intervals by the professors and students of botany, zoology, geology, mechanical technology (including metallurgy), chemical technology, agriculture, surveying, and mechanical and civil engineering. In these excursions various manufactories and works are visited, botanical and geological expeditions of great length made; in fact every means adopted for giving the students a practical as well as theoretical knowledge whenever possible. It only remains to be said that most of the students enter at about eighteen or nineteen years of age, having generally previously passed through an education of six annual courses in the Realschulen (Government schools, where solely technical subjects, entirely excluding the ancient languages, are taught), preceded by four annual courses in the Hauptschulen (preparatory Government schools for children).

*Regulations of the Imperial Royal Polytechnic Institution in Vienna.**

I.—GENERAL REGULATIONS.

Sec. 1.—The Vienna Polytechnic Institution is intended to afford a thorough theoretical, and also, as far as possible, practical education for the professions which are represented in it by special preparatory divisions.

Sec. 2.—The following divisions exist in the Institution:—A, the *general division*, in which those subjects are taught which form the scientific basis of the subsequent special studies; B, the division for *civil engineering*; C, for *building*; D, for *mechanical engineering*; E, for *technical chemistry*.

Sec. 6.—The instruction in the separate subjects is given partly in annual terms lasting from 1st of October to the end of July, and partly in biennial terms, the first ending in February, and the other beginning 1st of March.

II.—REGARDING THE STUDENTS.

Sec. 7.—The students are divided into *ordinary*, that is, those who are matriculated either for the general division or one of the special divisions, and who attend the entire course of education according to the proper regulations; and into *extraordinary*, that is, those who only attend certain lectures.

Sec. 8.—The ordinary students are designated as such in the certificates; they have all the rights connected with attending the Institution, and have to fulfil all the appertaining duties. The extraordinary students have in general the rights of the ordinary, but are not admitted to the "rigorosum" examinations (strengen Prüfungen, sec. 28); neither have they any right to scholarships. In the public certificates they are expressly designated as extraordinary students. Disregarding any special exceptions their duties are the same as those of the ordinary students. All students are subject to the disciplinary regulations. The ordinary students are subject, as regards discipline, to the heads of the divisions, the extraordinary to the rector.

* According to Imperial decree of 17th October, 1865.

Sec. 9.—Only those can enter as ordinary students into the first session of the general division who have either—1, absolved the upper Realschule, or upper gymnasium, with proper certificates; or, 2, passed with good results the “maturitäts” examination at a Realschule authorised thereto by the Government, not having been educated at a middle school. Gymnasium scholars must also prove sufficient readiness in geometrical and general drawing.

Sec. 10.—As long as “maturitäts” examinations are not regularly introduced into the Realschulen, those who are unable to show the proper certificates have to be subjected to an entrance examination at the Polytechnic Institution. Those mentioned in sec. 9, heading 2, must be at least seventeen years of age. The following are the subjects of the entrance examination:—*a*, arithmetic, algebra, geometry, plane and spherical trigonometry, analytical plane geometry; *b*, geography and history; *c*, physics; *d*, natural history; *e*, geometrical and general drawing; *f*, readiness in German style, to be proved by an essay on a given subject. The subjects from *a* to *e*, to the extent taught in the upper Realschulen, are accurately detailed in the special programme published by the Institution. A fee of five florins has to be paid for the entrance examination, which is received by the examiners.

Sec. 11.—Students just entering, who wish to be admitted as ordinary students to higher divisions, have—1, to fulfil the general entrance regulations (sec. 9), and, 2, to prove the necessary proficiency either by legal certificates, or by subjecting themselves to a gratuitous examination.

Sec. 12.—The following conditions have to be fulfilled by those wishing to enter as extraordinary students:—1, an age exceeding seventeen years; 2, proofs of the preliminary knowledge necessary for successfully attending the desired lectures. These proofs must be afforded either by legal certificates or by an entrance examination. For each subject of examination in this case an examination fee of two florins must be paid.

Sec. 13.—The entrance of ordinary students takes place at the beginning of the school year. They have to announce themselves personally, on or before the 7th of October, to the head of the division which they intend entering, and have to deliver to the same their *natale* (written statement of name, age, birthplace, name and position of parents, &c.), together with any other necessary explanations. The head of the division examines the written statements as to whether they fulfil the necessary conditions, and makes, if necessary, the arrangements respecting the entrance examinations. He then delivers to the applicant an attestation of his matriculation, in which the division and session into which he has been admitted, as well as the selected subjects, are detailed. In doubtful cases the determination respecting the admission of the applicant is left to the decision of all the professors of the division.

Sec. 14.—The announcement of extraordinary students has to be made in the same way to the professors of those subjects which the students wish to attend. For those lectures which are only delivered in the summer term the registration can only take place in the beginning of the second term.

Sec. 15.—As soon as the conditions mentioned in secs. 9 to 14 have been fulfilled, and as soon as the fees stated in secs. 19 to 21 have been paid, the matriculation of newly-admitted students, as well as the registration of already matriculated students, can take place.

Sec. 16.—The ordinary students have, as a rule, to adhere to the plan of study determined for the general and special divisions. Exceptionally they may be allowed to form another plan, in which case they must obtain the permission of the professors of the divisions in question. But this permission can only be given when in the plan selected, firstly, regard has been taken of the proper sequence of studies depending upon and

supporting each other; and, secondly, when the total sum of all the weekly hours for the selected subjects amount to at least eighteen, each two practice or drawing hours being reckoned as one.

Sec. 17.—Besides the subjects contained in his plan of study, the ordinary student may also attend lectures concerning other subjects for which he has sufficient preparatory knowledge. The statement of this has to take place either at the announcement (sec. 13), or at the latest on the 15th of October or 15th of March (sec. 6), and personally to the rector.

Sec. 18.—The students are also allowed, within certain limits, to attend the drawing-schools and laboratories at other hours besides those fixed in the plan of study.

Sec. 19.—Each student has, on first admittance to the Institution, to pay a fee of five florins. After an absence of one year or more the same amount has to be again paid.

Sec. 20.—Each ordinary student, to whatever division he may belong, and without regarding the number of the lectures he may select, has to pay a fee of fifty florins for the whole year. This fee may be either paid entire on admittance, or in two parts, of which the first is due on admittance, the second, at the latest, on the 7th March.

Sec. 21.—The fees to be paid by the extraordinary students are so calculated that for each hour per week during each biennial term, one florin fifty kreuzers has to be paid, each two practice or drawing hours being reckoned as one.

Sec. 22.—The extraordinary lectures of the professors, the lecturers of the assistants, and of the teachers not paid by the Government, have to be paid for according to the fees determined upon by the same.

Sec. 23.—By proving poverty, and at the same time proficiency, students may be either entirely freed from paying the fees (secs. 20 and 21), or only subject to half the charges.

Sec. 24.—From the *visa voce* and written examinations held during the year and at the end of the same, as well as from the other tasks delivered by the student, the result of his studies in the separate subjects is determined. The determination as to whether a student is altogether proficient enough to advance into a higher course is left to the divisional committee of professors. If a student has failed in the examination of any one subject, he will have to prove his proficiency in the subject at the beginning of the next session, up to at the latest the 7th October, paying for this examination a fee of five florins. If he omits to do this, or again fails, the his further advancement in his studies can only be allowed if the subject in question is not one the knowledge of which is indispensable for the proper study of the chief subjects in the next course. And in this case only those subjects must be attended for which a previous knowledge of the one failed in is not necessary. But for the advancement from the general division into a special division, at least a “sufficiently good” result must have been obtained in all the subjects given in the plan of study for the general division. Students who have been compelled to repeat a course are allowed to attend single subjects of the next following course of the next division, provided they are able to prove sufficient preparatory knowledge for each subject. The repetition of a subject attended with insufficient result, as well as the repetition of a course, is only allowed once.

Sec. 25.—Each ordinary student obtains at the close of the year a certificate, in which the attendance of, and result in each of the subjects of his division, as well as his general conduct, are specified. Similar certificates, but only for each single subject, are given to the ordinary student upon his attending not compulsory subjects. These latter certificates are the same as those which are given to the extraordinary students. The result is designated in the certificates—“excellent,” “good,” “efficient,” or “insufficient.” The conduct

designated either "entirely according to," or "according to," or "less according to the academical laws." The ordinary students can also obtain certificates of attendance for subjects not compulsory.

Sec. 26.—The resigning the attendance of single lectures has to be intimated to the respective professors; the leaving the Institution to the rector.

Sec. 27.—Under the name of guests, males may be admitted to the lectures on separate subjects, by permission of the respective professors, who, from their station and other qualifications, entitle the expectation that the objects of the teaching will not be prejudiced thereby.

III.—REGARDING THE STRICT (RIGOROSUM) EXAMINATIONS FOR OBTAINING A DIPLOMA.

Sec. 28.—The strict examinations are intended to prove the efficiency of the candidate for his profession. They have to show that the candidate has a complete knowledge of all the subjects of examination, both theoretically and practically, and particularly of the amount taught in the special professional division. A diploma is given on completing the strict examination.

Sec. 30.—The candidate for the strict examination has to prove at least sufficient proficiency in all the subjects contained in the plan of study of the division in question, and also in national economy, in the laws of trade and exchange, and in book-keeping.

Sec. 31.—A fee has to be paid for the strict examination: it amounts to 150 florins for each of the divisions for civil engineering, building, or mechanical engineering; and to 80 florins for the technical chemistry division. The fee in question has to be paid beforehand, and no gratuitous examination will be granted.

Secs. 32 and 33 contain further unimportant particulars concerning the strict examinations.

Sec. 34.—Should the result be insufficiently good, the strict examination can be repeated. This repetition can only take place once, and only after the expiration of the time fixed by the examining committee. The fee due for the examination has in this case to be again paid.

Sec. 35.—The subjects for the strict examination to the extent taught in the respective divisions are the following:—

B.—*Civil Engineering Division*.—1. Mathematics, geometrical drawing, technical physics, theoretical mechanics, machinery; 2, practical geometry and higher geodesy, building mechanics, building construction, road and hydraulic engineering.

C.—*Building Division*.—1, Mathematics, geometrical drawing, technical physics, mechanics, machinery, geology; 2, practical geometry, building mechanics, building construction, history of building, road and hydraulic engineering.

D.—*Mechanical Engineering Division*.—1, Mathematics, geometrical drawing, technical physics, mechanics, practical geometry; 2, general building construction, laws of machinery, building of machinery, and mechanical technology.

E.—*Technical Chemistry Division*.—Mineralogy, botany, and zoology; general and technical physics, machinery, chemistry, chemical technology, and knowledge of goods.

Sec. 36.—The strict examination may be passed for more than one division, provided the rules of secs. 30 and 31 be adhered to. In this case the examination committee may grant a dispensation from examination in those subjects of the next division in which the candidate has been examined in the former division.

PLAN OF STUDY FOR THE YEAR 1866-67.

A.—For the General Division.

Both the annual sessions of this division have to be passed by students wishing to enter the civil engineering, building, or mechanical engineering divisions. Students intending to enter the chemical division need only pass the first session of the general division; such students need not attend the geometrical drawing, taking instead

the lectures on Mineralogy and the laboratory practice.

—*First Session*.—Mathematics (algebraic analysis, analytical geometry, elements of differential and integral calculus), 10 hours weekly; geometrical drawing, 7 hours; constructional drawing, 8 hours; inorganic chemistry, 3 hours; zoology, 6 hours (in the winter term); botany, 6 hours (in the summer term); technical and free drawing, 7 hours. —*Second Session*.—Mathematics (differential and integral calculus), 5 hours; physics, 4 hours; technical mechanics, 5 hours; practical geometry, 4 hours; situational drawing (*Situational Zeichnen*), 6 hours; mineralogy, 5 hours; constructional exercises in geometrical drawing, 4 hours; technical and free drawing, 4 hours.

B.—Civil Engineering Division.

First Annual Session.—Technical physics, 3 hours; knowledge of machinery, 3 hours; constructive practice, 5 hours; building (course 1), 5 hours; constructional drawing, 10 hours; geology (course 1 in winter), 2 hours; geology (course 2 in summer), 8 hours; geological practice (in summer), 2 hours; ornamental drawing, 6 hours. —*Second Annual Session*.—Analytical mechanics, 2 hours; building mechanics, 2 hours; spherical astronomy (in winter), 4½ hours; higher geodesy (in summer), 4½ hours; hydraulic and bridge engineering, 5 hours; constructional exercises and plans, 10 hours; tracing (*Terrain Lehre*), in summer, 2 hours. —*Third Annual Session*.—Road and railway engineering, 5 hours; constructional exercises and plans, 15 hours; artistic perspective (in winter), 2 hours; perspective and landscape drawing, 4½ hours.

C.—Building Division.

First Annual Session.—Building (course 1), 5 hours; building construction exercises, 10 hours; knowledge of machinery, 3 hours; constructional exercises, 5 hours; geology (in winter), 2 hours; mechanical technology (in winter), 5 hours; ornamental drawing and modelling, 6 hours. —*Second Annual Session*.—Art of building, 3 hours; practice in architectural drawing and planning; encyclopædia of road and hydraulic engineering (in summer), 4 hours; building mechanics, 2 hours; technical physics (in winter), 2 hours; perspective and landscape drawing, 6 hours; ornamental drawing and modelling, 4 hours. —*Third Annual Session*.—The particulars concerning this session will only be published for 1867-8.

D.—Mechanical Engineering Division.

First Session.—Analytical mechanics, 2 hours; laws of machinery (*Maschinen Lehre*), course 1, 3 hours; building of machinery (*Maschinen Bau*), course 1, 3 hours; constructional exercises, 10 hours; mechanical technology, 5 hours; technical physics, 3 hours; knowledge of building, 2 hours; building drawing, 6 hours. —*Second Session*.—Laws of machinery (course 2), 2 hours; building of machinery (course 2), 10 hours; constructional exercises and plans, 15 hours; chemical technology (sugar manufacturing and brewing), 7½ hours.

E.—Chemical Technical Division.

First Session.—Organic chemistry, 3 hours; analytical chemistry, 2 hours; laboratory practice, 10 hours; general physics, 4 hours; technical mechanics, 5 hours; mineralogy (in winter), 5 hours. —*Second Session*.—Chemical technology (sugar manufacturing, brewing, dyeing, tanning, soap manufacturing, distilling, wines, &c.), 7½ hours; laboratory practice, 20 hours; technical physics, 3 hours; knowledge of machinery, 3 hours; knowledge of goods, 2 hours. —*Third Session*.—Laboratory practice, 20 hours; knowledge of building (in winter), 4 hours; mechanical technology (metallurgy, working of metals, working of wood, spinning, paper manufacturing, &c.), 5 hours; geology (course 1 in winter), 2 hours; geology (course 2 in summer), 5 hours.

Lectures not appertaining to any Division in particular.

Modern history, history of Austria, zoological palæontology, history of German literature, the German classics, essays and declamation, æsthetics, agriculture (courses 1 and 2), national economy (courses 1 and 2),

laws of trade and barter, statistics, political laws of Austria, book-keeping, business style, modelling.

Extraordinary Lectures.

Integration of lineal differential equations, geometry of position and graphical calculations, political arithmetic and assurance, graphical statics, mathematical crystallography, crystallographic physics, anatomy of plants, botanical physiology, chemistry of the alcohols, psychology and logic, ornamental drawing, accidental surgery.

Languages and Accomplishments.

French, English, Italian, Persian, Turkish, Vulgo-Arabic—Stenography.

Fine Arts.

DECORATIONS OF THE NEW OPERA HOUSE OF PARIS.—The reports of the intended decorations of the new Opera House have been so extraordinary, that most people believed them to be exaggerated; this, however, is not the case, as the following list, supplied by M. Garnier, the architect of the new building, to the *Moniteur des Arts*, will show:—The paintings ordered, and in course of execution, are, for the grand public saloon, ten subjects for the coverings of the ceilings from mythology and history: "Orpheus," "Education of Jupiter," "Bacchantes," "Judgment of Paris," &c., by M. Paul Baudry; "Parnassus," terrestrial and divine, to fill two large coverings; and ten oval medallions over the doors, by the same. A room to the left of the above, to be decorated by M. Delaunay, the ceiling with a "The Glorification of Singing," and three tympana, continuing the subject. The corresponding room on the other side, "Harmony," in a ceiling and three tympana, by M. Barrias. The great saloon for the ballet: four panels representing the various phases of the dance, and twenty portraits of famous dancers, by Gustave Boulanger. Grand staircase: four subjects, "Art," "Music," "Poetry," and "The Dance," in large compartments, by M. Pils; and twelve works in enamel, by M. Emile Solier, representing as many cities where famous operas have been produced, London included. A grand cupola, by M. Jules Lenepveu, "The Gods and Goddesses on Olympus," representing the symbolic arts; three landscapes by MM. Félix Thomas, Lanoue, and Harpignies. The above are all ordered, and the following are proposed to be added to the list:—Four grand panels, and three tympana, with figures on a ground of gold, for an anteroom; a grand allegorical ceiling for the Imperial saloon, and five panels for the antechamber to the saloon; panels and friezes for the Empress's boudoir; eight tympanums in the Imperial vestibule. Smoking-room: eight historical figures, with plans, representing the eight places which have been used for operas in Paris; a ceiling and eight medallions for the large ice-room; friezes for the small ice-room; twelve panels, containing figures representing as many kinds of dances, for the café; and lastly, twenty portraits of celebrated singers, by Gérôme, de Curzon, Chiffard, Lœnin, Brisset, Giacomotti, Biennoury, Lévy, Auber, Leconte de Roujou, Balleroy, Ph. Rousseau, Monginot, Gendron, Landelle, Hamon, Marchal, Giraud, Saintin, Wetter, François and Benouville. The sculpture is in keeping with the painting. On the principal façade of the building above, four groups by M. Maillet; below, groups representing the "Dance," "Harmony," "Comedy," and the "Drama," and "Singing" and "Music," by Carpeaux, Jouffroy, Perrand, and Guillaume; and in the centre, statues representing the "Idyl," "Elegy," "Mythology," and "History," by Aizelin, Chapu, Dubois, and Falguières. On the two frontons of the same façade, figures of "Architecture" and "Industry," by Jean Petit, and painting and sculpture, by Gruvère. On the two lateral façades, frontons representing "Comedy" and the

"Drama," by Girard, "Art" and "Science," by Maniglier; the "Drama" and "Music," by Ottin; and "Singing" and "Poetry," by Cabet. The grand galvanoplastic groups, by Gummery, representing "Poetry" and "Music," supported by figures of Fame. Over the centre of the proscenium, a galvanoplastic group, "Apollo holding the lyre," and two allegorical figures, by Aint Millet; and in the angles, "Pegasus restrained by the Muses." On the frontons of the Imperial pavilion, the arms of France, with attributes, by Pollet and Travaux. On the Imperial staircase, four "Cariatides," by Elias Robert and Mathurin Moreau. On the principal façade, gilt bronze busts of Mozart, Meyerbeer, Spontini, Beethoven, and Auber, by Chabaud; and of Halévy, Rossini, Quinault, and Scribe, by Everard. On the lateral façades, busts in stone of Cambra, Cambert, J. J. Rousseau, Philidor, Piccini, and Paisiello, by Hame; Cherubini, Mehul, Nicolo, Weber, Bellini, and Adam, by Denécheau; Monteverde, Durante, Jomelli, Montsigny, Grétry, and Sacchini, by Walter; and Lescar, Berton, Boieldieu, Hérold, Donizetti, and Verdi, by Bruyer. Medallions on the façade, of Pergolesi, Haydn, Bach, and Cimarosa, by Gummery. Two grand candelabra, allegorical of the moon and the stars, by Chabaud. In the interior of the building, four seated statues of Lulli, Rameau, Gluck, and Handel, representing Italian, French, German, and English music, artists not yet appointed. On the grand staircase, two "Cariatides" in coloured marble, by Jules Thomas. In the grand saloon, two "cariatides," flanking the chimney-piece, by Carrier Belleuse and Cordier. In the theatre itself, "cariatides," at the Imperial and opposite boxes, by Cranck and Lepère. It is proposed, in addition to the above, to place twenty plaster figures in the grand saloon, with busts of living composers, bas-reliefs and ornaments. Over the Imperial pavilion are eagles, by Caën, while others by Jacquemart and Rouillard crown the columns and guard the entrance.

Manufactures.

NEW PROCESS FOR SUGAR MAKING.—Mr. Knaggs, of Seven Plantations Estate, Lower Clarendon, Jamaica, himself a practical sugar producer, has invented machinery for the manufacture of sugar, the object of which is to enable white crystalline sugar of the best quality to be produced direct from the juice on the estate of the cane planter. An account of this machinery appeared in the *Standard*, and has been quoted in the *Produce Markets Review*. The inventor, bearing in mind the necessity for the speedy grinding of the cane, and the thorough cleansing of the mill, pump, gutter, and all other surfaces with which the juice may come in contact, begins with the application of sulphurous acid gas as soon as possible after expression. This he effects by burning sulphur, and forcing the gas generated into the fluid in the tank. The liquor is then pumped into the clarifiers, where it is treated with the gas, which is forced continually into the cistern during the whole time the mill is at work. The juice after gasing is rapidly brought up to the boiling point, and the scum thrown up removed. Cretaceous earth is used to neutralise the sulphurous acid; and the clarification is effected by the manganate or permanganate of soda, or of potash and lime. The liquor is then drawn into a subeider, a vessel intermediate between the clarifiers and the copper, or more properly, in Mr. Knaggs' process, the evaporator, which is of considerable dimensions, and in outer appearance has much the aspect of an ordinary fixed boiler, with a couple of furnaces beneath. The fire of these furnaces plays around a great number of vertical tubes, pendant from the boiler itself, which is 18 feet long by 6 feet wide, and one foot in depth. Upon the upper surface of this is formed the evaporator, a shallow pan of like dimensions. The fluid flows into this, and covers a

number of horizontal steam tubes, which penetrate its entire mass, and heat it thoroughly throughout its depth and extent; the heat passing from the pipes to the juice, the steam within them is condensed, and returned to the boiler. By this arrangement an extraordinary amount of evaporation is effected, far exceeding what would be estimated by the usual formula. The juice is converted into syrup in a continuous stream, and cannot at any time come into contact with surfaces heated above 230 degrees, and consequently charring or blackening of the syrup is impossible; and contact with the air is avoided by the arching over of the evaporator. The juice having been brought to a state of syrup, it passes on continuously to the granulator, in which the granulation is effected at a low temperature. This granulator consists of a long oval metal trough, encased in a jacket. Inside the oval trough are packed a number of steam tubes, which communicate at either end with the space between it and the jacket, so that the boiled-down syrup coming in from the evaporator is heated by the steam pipes and trough to 212 degrees. A laminated revolver or drum, diagonally fitted with a number of long thin blades, keeps turning up the syrup. These blades offer a large extent of surface, and continually expose thin films of heated syrup on both sides to a rapid evaporation. To increase the action, heated air is driven into the interior of the drum, and passes over the revolving blades, accelerating by its capacity for the absorption of vapour the granulation of the syrup upon them. The heat for all this portion of the apparatus is derived entirely by the utilisation of the waste steam arising from the first evaporation; and the temperature need never exceed 170 degrees. The grain of the sugar produced is quite equal to that made in a vacuum. The process is constantly in operation, and the juice, during the whole period of its concentration, is never subjected to any lengthened detention in any particular stage, nor to any injurious degree of heat. The apparatus can be made to cleanse itself effectually; there is no necessity of discontinuing work for the night; a few hands can attend to all requirements; no personal judgment or constant supervision is needed, and the robberies extensively carried on in the plantations could not be perpetrated when no syrup or sugar is exposed to pilfering hands. Mr. Knaggs' system also includes a novel still, and an apparatus for drying megas, both of which are worked by means of the waste steam from the evaporator. Another advantage of the new sugar apparatus appears to be that, having been supplied with a small quantity of water at starting, it continues not only without any further supply, but actually condenses a constant stream in the process of the evaporation of the juice. This feature is one which will be thoroughly appreciated in all dry tropical countries.

Commerce.

STATE OF COMMERCE IN FRANCE.—There is a slight improvement in the returns of imports and exports; the official returns show not only that the deficiency of exports, as compared with 1866, ceased with the month of May, but that the exports of June exceeded those of the same month last year by 3,288,000 francs (£131,520). It is remarkable that, in France, while the exports of the six months exhibit a deficit of more than 195,000,000 of francs, the imports during the same period exceed those of 1866 by 141,500,000; the principal cause of this excess was the badness of the last harvest, the imports of cereals, and other alimentary substances, amounting to 48½ millions against 405½ millions of export. The item of fuel, metals, and machinery, also shows 187½ millions of imports against 39 millions of exports; but the largest difference between imports and exports is naturally in the raw materials of the manufactures, the imports of which amount to 790½ millions against 247½

millions of exports. The following are the totals of imports and exports of the six months in millions of francs, in the sections of metallurgy and machinery:—

Minerals of all kinds..	9.6 imports.	4.8 exports.
Iron and steel.....	7.8 "	0.2 "
Other metals.....	59.7 "	6.0 "
Coal and coke.....	65.0 "	2.1 "
Arms, ammunition of		
war, ships, boats, &c.	9.2 "	3.7 "
Machinery, tools, &c.	10.5 "	18.3 "

Of the last item of export four millions of francs belong to the month of June. The movement in shipping also bears witness to the improvement in commerce, the entries for June having been 5,186 vessels, of a total burthen of 916,627 tons, being an increase, as compared with the average of the five previous months, of more than 900 vessels and 67,118 tons.

Colonies.

COLONIAL MAIZENA.—A Sydney paper says:—"The article known as Maizena has now come into very general use. This substance is ground maize, finely dressed. Its preparation resembles that of arrowroot, and the operation is simple. The corn is gathered just before it begins to harden, reduced to a pulp, and mixed with water; it is then strained through a coarse sieve. The liquor is placed on vessels from which the moisture departs by evaporation, leaving the maizena ready for packing. Many people seem confident that the colony will be able to compete with the English manufactured article, if not by selling at a lower rate, yet by selling a better quality at the same price. There is scarcely any country where the raw material can be obtained under more favourable circumstances than in some of the Australian colonies."

AUSTRALIAN AMBER.—A curious discovery, that of a mine of amber, has been made at Grassy Gully, near Rokewood, and some men are now at work at the mine, and others prospecting for the same mineral in the vicinity. A professional mineralogist of Ballarat thus reports on the substance found:—"The resinous substance left with me for examination is undoubtedly amber, and has not previously, to my knowledge, been found in this colony, making, therefore, another addition to our colonial minerals. The colour of the said substance is brown, streaked yellowish white, transparent, conchoidal fracture, lustre waxy. Specific gravity, 1.1. Acquires resinous electricity by friction; contains empyreumatic oil and succinic acid, and corresponds in all other respects with the brown amber of Europe."

Obituary.

M. RAYER, member of the Institut of France, formerly Dean of the School of Medicine of Paris, and president of the Central Committee of Public Salubrity, died recently at the age of 74. M. Rayer was author of a treatise on diseases of the skin, and on the urinary secretions; and founder of the Société de Biologie.

Notes.

CONVENTION BETWEEN FRANCE AND PORTUGAL.—An Imperial decree of the French Government promulgates the conditions of a convention made with Portugal for the mutual protection of the productions of intellect and art. The terms are the same as those adopted in the conventions made with other countries, placing the authors and artists of both nations on perfect equality.

COMPLETION OF THE ROAD SYSTEM IN FRANCE.—A series of very important documents appeared in the

Monieur, a short time since, relative to the completion of the various lines of road, and the improvement of the rivers and canals of the empire. They consist of reports of ministers and an Imperial decree for the completion of the works commenced in 1861. The first object in view is, by the creation of a special fund on long annuities, to complete the proposed system of local roads in a period of about ten years. The municipal councils were directed to meet in the beginning of September, each in its own commune, and revise and classify the roads proposed to be executed. They are to be classed in three categories, according to their importance and consequent urgency. The revised lists of the councils are then to be open to the public for ten days, with a view to collect the opinions of the populations; and at the end of the same month the members of the same councils, as well as of those of the various *arrondissements*, and the *maires* of the communes, are to meet in each canton, and revise the work of the several municipal councils. Estimates are then to be drawn up for the execution of the first and second categories, and, finally, a commission elected from the councils of departments is to meet in the early part of November and report on the classification, the time proposed for the execution of the works, and on the ways and means, and the prefects are to report the result to the Minister of the Interior, to whom the execution of the decree is entrusted. The total amount of the rough estimate, as given in the ministerial report, is 800,000,000 francs (£32,000,000), distributed over ten years; of this sum 500 millions is for the cost of construction, and the remaining 300 millions for maintenance. The expenditure for the same purposes at the present time is equal to rather more than half the gross amount given above. The difference is proposed to be supplied in the following manner:—One half by the communes themselves, one quarter by the departments, and the remaining quarter by the state. The special funds are to be raised under a guarantee from the government, on thirty year annuities, at 4 per cent. interest.

SUPPLY OF WATER FOR PARIS.—Another immense reservoir, similar to that which some of the members of the Society of Arts visited a short time since at Menilmontant, is about to be constructed on an eminence at Montrouge, near the Barrière Saint Jacques, to receive the waters of the valley of the Vanne, the subject being announced for adjudication on the 25th Sept. at the Hôtel de Ville. It is estimated that the valley of the Vanne, which is rich in springs emanating from the chalk beds, will furnish easily, at a maximum altitude of 70 mètres, 100,000 tons of excellent water. A third reservoir, constructed at Passy in 1858 to receive spring water, completes the triangle by means of which the houses of Paris may eventually be supplied with water as high as the fifth floors.

SHIPWRECKS.—The *Bureau-veritas* of Paris gives the following as the list of total losses for the month of July:—

British vessels	68
Norwegian	25
American	22
French	14
Danish	8
Prussian	8
Dutch	6
Miscellaneous	16

Total

167
Of these only ten were steamers. In addition to the above there were thirteen vessels wrecked and condemned, and fourteen others supposed to have been lost in consequence of the absence of all news respecting them. The total number of vessels lost between the 1st January and the 31st July is stated to have been 1,684, or twenty-five more than during the same period of last year.

Proceedings of the Society.

MEMORIAL TABLETS OF GREAT MEN AND EVENTS.

Tablets to the memory of illustrious men have now been placed in the following situations in London:—

Lord Byron.—24, Holles-street, Cavendish-square.
Napoleon III.—3A, King-street, St. James's.

Whilst the Council intend proceeding with this work, they desire also to see it carried on by others—either by corporate bodies or individuals—and the Council will be happy to be instrumental in procuring suitable tablets from the manufacturers. It is hardly necessary to repeat how greatly the interest of the metropolis would be increased thereby.

In order to show how rich the metropolis is

in the memory of important personages and events, which it would be desirable to mark by means of tablets on houses, the Council have caused an alphabetical list to be prepared, the second part of which is now inserted. Other parts will follow. The Council request the assistance of members of the Society in completing and correcting this list, especially with reference to dates and the insertion of other names.

Castlereagh, Lord (b. 1769—d. 1822); he originated the idea of starting the Travellers' Club; lived in St. James's-square, in the large house north corner of King-street; buried in Westminster Abbey.

Catnach, ballad printer, lived in the Seven Dials.

Cave, Edward (b. 1691—d. 1754); editor, printer, and proprietor of the *Gentleman's Magazine* (1731). He lived at St. John's-gate, Clerkenwell.

Cavendish, George, Earl of Burlington, lived in Burlington-house. He obtained a renewal of the lease when, in 1809, there was a talk of its coming down.

Cavendish, W., Duke of Newcastle, and Margaret, his Duchess, m. 1673 (b. 1592—d. 1676); lived in Clerkenwell, and, at the time of the Restoration, at Dorset-house, Fleet-street.

Caxton, William, the father of English printing, set up the first printing press in the Almonry, Westminster; lived in a house on the north side of the Almonry, called "The Reed Pale;" buried and monument to him in St. Margaret's, Westminster.

Cecil, Sir Robert, Earl of Salisbury (b. 1550—d. 1612); lived in Beaufort-house, Chelsea; also in Salisbury-house, Strand, which stood on the sites of Cecil-street and Salisbury-street.

Cecil, Thos., Earl of Exeter (d. 1622); lived at Exeter-house, now the site of Burleigh-street, Strand. He is buried at Westminster Abbey.

Centlivre, Susannah (b. 1680—d. 1723); authoress of the "Busy Body" and the "Wonder;" died in Buckingham-court; buried in St. Paul's, Covent-garden.

Chamberlain, Dr. Hugh (b. 1664—d. 1728); one of the early inhabitants of Essex-street.

Chambers, Sir Wm. (b. 1726—d. 1796), architect; designed the Albany and the present building of Somerset-house; lived in Berners-street, Oxford-street.

Charitroy, Sir Francis, R.A. (b. 1782—d. 1841), sculptor, and one of the founders of the Athenæum Club; lived in an attic in No. 24, Curzon-street, May-fair; also in No. —, Eccleston-street, from 1814 until his death.

Chapman, George (b. 1557—d. 1634), translator of Homer, buried in St. Giles-in-the-Fields.

Charles V. of Spain (b. 1500—d. 1558) lodged in Blackfriars when on a visit to Henry VIII. His retinue were lodged in various parts, some in Bridewell-house, and others in St. Lawrence-lane.

Charles X. of France (b. 1757—d. 1836); lived in No. 72, South Audley-street, Grosvenor-square, now Mr. Hankey's.

Chatelaine, J. B. (circ. 1760—d. 1774), engraver; died in White Bear Inn, Piccadilly.

Chatterton, Thos. (b. 1752—d. 1770), poet; lived and died at a Mrs. Angel's house, in Brooke-street, Holborn. Buried on the site of Farringdon Market.

Chesterfield, Catherine, Countess of (d. 1677); lived in New-street, Covent Garden, on the south side, in 1660.

Chesterfield, Philip, Earl of (d. 1713); lived in Bedford-street, Strand; also in outer Spring-gardens from 1667 to 1670. He died in Bloomsbury-square.

Chesterfield, Philip, Earl of (b. 1694—d. 1773); spent a great part of his time at White's Club-house; lived and died in Chesterfield-house, South Audley-street.

Chicheley, John, Chamberlain of London; lived in Baker's-hall, Harp-lane.

Christian IV., King of Denmark (d. 1648); lodged in

Somerset-house when on a visit to his daughter, Queen of Denmark.

Cibber, Colley (b. 1671—d. 1757), Poet-Laureate; he in Southampton-street, facing Southampton-row, lived in Islington; said to have died in a house at the Castle Tavern. Also lived in Spring-gate from 1711 to 1714.

Cibber, Susannah Maria (b. 1714—1766); lived at a centre house in Golden-square. Buried in Westminster Abbey.

Clare, John, Earl of (d. 1711), was living in Warwick-house in 1688.

Clarke, Dr. Samuel (b. 1675—d. 1729); author of "Attributes of the Deity," Minister of St. Paul's Wharf; also Rector of St. James', Piccadilly. Lived and died in the dark red brick rectory at the north side of St. James', Piccadilly.

Cleland, William, Pope's friend, lived in St. James's-place, St. James's-street.

Cleveland, Barbara, Duchess of, (d. 1709), lived in Burlington-street, Piccadilly, 1691 to 1694, also in Leinster-house or Cleveland-house, St. James's. Buried at St. Margaret's, Westminster.

Clifford, Lady Anne, (Ann Pembroke, Dorset, Montgomery), (b. 1789-90—d. 1676), married the Duke of Somerset in her mother's chambers, in Austin Friars House; lived in Baynard's Castle, on the Thames.

Clifford, Thomas Lord (the Lord Treasurer), (b. 1616-1673), lived in Charles-street, St. James's-square, in Wallingford-house, which stood on the site of the present Admiralty.

Clive, Kitty, the actress (b. 1711—d. 1785), lived in Henrietta-street, Covent-garden, where she advertised her benefit in 1756.

Clive, Robert, Lord, Governor-General of India (b. 1705—d. 1774); educated at Merchant Taylor's; committed suicide at 45, Berkeley-square.

Closterman, John, painter (b. 1656—d. 1710), lived at what is now Richardson's Hotel, Piccadilly.

Cobbett, William (b. 1762—d. 1835), lived in Black-street; here he published his "Register."

Cobden, Richard, M.P., instituted the Free Trade Club, 14, St. James's-square.

Cobham, Richard Temple, Lord, Pope's friend, died and lived in Hanover-square.

Cocker, Edward (ob. circ., 1677), the arithmetician whose name passed into the expression, "accountant Cocker," lived on the south side of St. Paul's Church over against Paul's-chain; here, in 1760, he wrote "The Pen's Transcendancy;" buried in St. George's-the-Martyr.

Colbert, Jean Baptiste (b. 1619—d. 1683), the French Ambassador in the time of Charles II., lived in Leicester-house.

Coke, Sir Edward (b. 1551-2—d. 1633), the last Lord Chief Justice of England, member of the Inner Temple.

Coleridge, Samuel Taylor, poet, (b. 1772—d. 1836), educated at Christ's Hospital; retreated, in one of his moody fits of melancholy abstraction to 17, New-street; also lived, during his last years, at the House of Society of Literature, 4, St. Martin's-place, Church-cross.

Colet, John, Dr. (b. 1406—d. 1519), founder of St. Paul's School; vicar of Stepney.

Collins, Arthur (b. 1682—d. 1760), compiler of "Peerage," lived at the "Black Boy," in Fleet-street; here, in 1709, he published the first volume of "Peerage."

Collins, Wm., R.A. (b. 1788—d. 1844), artist; painted sea-side pieces; lived and died at No. 1, Devon-street, Hyde-park-gardens.

Colman, George, the Elder (b. 1733—d. 1794), who bought the licence of the Haymarket theatre, of Estlin in 1777; lived in the left-hand corner of Bazaar-buildings.

Colman, George, the Younger (b. 1762—d. 1836), who lived and died at No. 22, Brompton-square.

- Compton, Henry, Bishop of London (b. 1632—1713); lived in London-house; Aldersgate-street.
- Congreve, Wm. (b. 1672—d. 1729), dramatist and poet; a templar; was living in Surrey-street when visited by Voltaire; died here; buried in Westminster Abbey.
- Constable, John, R.A. (b. 1776—d. 1837), artist; lived at 35, Charlotte-street, Rathbone-place, from 1822 till his death, in 1837.
- Conway, Henry S. (b. 1720—d. 1795); Field-Marshal, and Walpole's correspondent; lived in the right-hand corner house leading from Greek-street, on the south side of Soho-square.
- Cooper, Sir Astley (b. 1768—d. 1841), surgeon; lived at No. 2, New-street, Spring-gardens; he was buried in the chapel of Guy's Hospital, Southwark; there is a monument to him in St. Paul's Cathedral.
- Cooper, Samuel (b. 1609—d. 1672), miniature painter; lived on the south side of Henrietta-street, Covent-garden; a monument is erected to him in the church of St. Pancras-in-the-Fields.
- Copley, John, S. (b. 1737—d. 1815), the American painter; lived at 25, George-street, Hanover-square.
- Cornwallis, Lady (time of Charles II.); lived in Newport-street, Long-acre.
- Coryat, Tom. (d. 1617), the celebrated traveller; lived in Bow-lane, Cheshide.
- Cosway, Richard, R.A. (b. 1740—d. 1821), artist; obtained the first prize for drawing of the Society of Arts; he lived at Schomberg-house, Pall-mall, and a tablet is erected to his memory at St. Marylebone New Church.
- Cotes, Francis, R.A. (b. 1726—d. 1770), artist; lived and died in 32, Cavendish-square.
- Collingham, Sir Francis, afterwards Lord (b. 1574—d. 1651); lived at Wallingford-house, which stood on the site of the present Admiralty, and was an official residence at an early period; he was granted the manor of Kennington; a monument is erected to his memory in Westminster Abbey.
- Cotton, Charles (b. 1630—d. 1687), the friend and companion of Isaac Walton; is buried in St. James's Church, Camberwell.
- Cotton, Sir Robert (b. 1570—d. 1631); the founder of the famous Cotton Library; lived at Cotton-house, Westminster. A portrait of him hangs in the British Museum, suspended on the walls of the Eastern Zoological Gallery.
- Coventry, Thomas, Lord (d. 1640) Lord Keeper; lived and died in Durham-house, Strand.
- Coventry, William, Earl of (d. 1750), lived in Hanover-square.
- Coventry, Henry (b. 1618—d. 1686), secretary to Charles II., lived in Coventry-house, which stood on the site of Coventry-street, Haymarket. He is buried in St. Martin's-in-the-Fields, where a monument is erected to his memory.
- Coventry, Sir John. At the corner of Suffolk-street, Haymarket, this gentleman had his nose cut to the bone for some remarks he had made in the House of Commons. This led to the passing of the famous "Coventry Act" against cutting and maiming the person.
- Cowley, Sir Roger de, lived in Bow-street, also in Norfolk-street, but chiefly in Soho-square.
- Cowley, Abraham (b. 1618—d. 1667), the poet, patronised by the Earl of St. Alban's, was born in Fleet-street, London, near Chancery-lane, educated at Westminster School, and while a scholar here he published a volume of poems. His portrait hangs in the Privy Gardens collection. He lay in state at Wallingford-house, the residence of the Duke of Buckingham, and was buried in Westminster Abbey, where a monument is erected to his memory.
- Cowley, Hannah (b. 1743—d. 1809), authoress of "The Belle's Stratagem," which she wrote in Corporation-row, Islington-spa.
- Cowley, Richard (d. 1618), actor, and one of the original performers in Shakespeare's plays. Buried in St. Leonard's, Shoreditch.
- Cowper, William, Earl (b. 1670—d. 1723), Lord Chancellor. He lived at 13, on the west side of George-street, Hanover-square.
- Cowper, Sir William, Bart. (d. 1664), lived in the neighbourhood of Cowper-court, Cornhill, where he owned large property. He built Portugal-row, Lincoln's-inn-fields.
- Cowper, William (b. 1731—d. 1800), the poet, was educated at Westminster School. The quay fronting the Thames by the Custom-house was the place where he intended drowning himself during his insanity, but gave up his idea as the water was low. In the churchyard of St. Margaret's, Westminster, when a school-boy, he met with an adventure which greatly affected his mind. One dark evening he saw a light in the churchyard, and going up to it found the sexton digging a grave. As Cowper approached he was struck on the leg by a skull which the old man had just turned up and was throwing out.
- Crabbe, Rev. George (1764 to 1832), poet, lived at 37, Bury-street, St. James's. In Charles-street, St. James's-square, he was introduced to and obtained the patronage of Burke.
- Craggs, James (d. 1770), Secretary of State, and friend of Pope and Addison, &c. He lived at St. James's-place, St. James's-square; he died in Jermyn-street, St. James's, and was buried in Westminster Abbey, where a monument is erected to his memory.
- Craven, William, Earl of, (1608 to 1697), founder of Pethouse-field, in use during the plague; he lived in Berkshire-house, St. James's; also in Craven-house, Drury-lane. A portrait of him hangs in the Charterhouse.
- Cremorne, Lord, lived in Chelsea.
- Crew, Lord, Bishop of Durham (1633 to 1721), lived in the Piazza, Covent-garden.
- Crispin, Dr. (about 1687); one of the earliest inhabitants of Pimlico.
- Crockford, William (b. 1776—d. 1844), founded Crockford's Club, in St. James's-street; he lived in the house immediately adjoining Temple-bar.
- Cromarty, George Mackenzie, Earl of (b. 1710—d. 1744), lived and died in Poland-street, Oxford-street.
- Cromwell, Elizabeth (b. 1651—d. 1731), daughter of the Protector, Richard Cromwell, died, in her 82nd year, in her house in Bedford-row, Bloomsbury.
- Cromwell, Oliver (b. 1599—d. 1651), commenced his career as a law student at Lincoln's-inn; was married to Elizabeth Bowchier, at St. Giles's, Cripplegate, 1620; frequented, with several of his party, the Star Tavern, in Coleman-street; upset a coach and six in Hyde-park, and was nearly killed. He lived at the Cockpit, Whitehall, 1649-50, at King-street, Westminster, and in Long-acre. An autograph letter, written on the field of Naseby, together with his portrait, are in the British Museum, and his sword is preserved in the United Service Institution.
- Cromwell, Thomas, Earl of Essex (d. 1450); lived in Throgmorton-street, City, on the site of the Draper's Hall, and gardens.
- Cruden, Alexander (b. 1701—d. 1770), author of the "Concordance," lived in the Savoy, in the Strand, also in Camden-passage, Camden-street, where he died.
- Cumberland, Henry Frederick, Duke of (b. 1744—d. 1790), lived at the Ordnance-office, Pall-mall.
- Cumberland, William Augustus, Duke of (b. 1721—d. 1765), hero of Culloden, born in Leicester-house, lived in Pall-mall, and lived and died in Upper Grosvenor-street.
- Cumberland, Richard (b. 1732—d. 1811), dramatist, educated at Westminster School; lived in Queen Anne-street East, Cavendish-square, now Foley-place; here he wrote his best play, "The West Indian." He died at the house of Mr. Henry Fry, in Bedford-place.

- Cunningham, Allan (b. 1784—d. 1842), poet; author of "The Lives of British Painters, Sculptors, and Architects;" lived and died in 27, Lower Belgrave-place.
- Curril, Edmund (d. 1748), bookseller; lived in Bow-street, next door to Will's Coffee-house; also in Fleet-street, at "the Dial and Bible, against St. Dunstan's Church;" also in Rose-street, Covent-garden. He published here "Pope's Literary Correspondence." Pilloried at Charing-cross.
- Curran, J. Philpot (b. 1750—d. 1817); lived and died at No. 7, Amelia-place, now Pelham-crescent, Brompton.
- Curzon, Lady Diana (circ. 1668); lived in Portugal-row, Lincoln's-inn.
- Daffy, Mrs. (d. 1732), elixir maker; lived and died in Salisbury-court, Fleet-street.
- Damer, Honourable Anne Seymour (b. 1748—d. 1828), the sculptor; lived in No. 18, Upper Brook-street, Grosvenor-square. A statue of her, by Caracchi, is in the British Museum.
- Danby, Thos. Osborne, Earl of (b. 1632—d. 1712), Lord Treasurer; one of the chief institutors of Magdalen Hospital; lived at Wallingford-house, which stood on the site of the present Admiralty.
- Dance, Sir Nathaniel (b. 1730—d. 1811), artist; lived at 13, Tavistock-row, Covent-garden.
- Daniel, Samuel (b. 1562—d. 1619), poet; lived in a garden house in Old-street, St. Luke's, near the Charter-house.
- Dartmouth, Wm. Legge, Earl of (d. 1750), annotator of Burnet; lived in Queen's-square, Westminster. A portrait of him, by Sir Joshua Reynolds, hangs in the collection of the Foundling Hospital.
- Davenant, Sir Wm. (b. 1605—d. 1668) actor. At Rutland-house the drama revived under Sir William Davenant, Cromwell, by the interposition of White-locks consenting to the performance of declamation and music after the manner of the ancients. Sir William Davenant lived in Axe-yard, King-street, Westminster. Was imprisoned in the Tower of London. Was buried in Westminster Abbey, where his grave has this short inscription, "O rare Sir Wm. Davenant."
- Davies, John (d. 1617), poet and writing master; lived in the Middle Temple. Divided his leisure time there between composing a poem on the "Immortality of the Soul," and one on "Dancing." He was buried at St. Dunstan's in the West, Fleet-street.
- Davies, Thomas (d. 1785), bookseller and actor; lived in Russell-street, Covent-garden, on the side "over against Tom's Coffee-house," now the Caledonian Coffee-house. Buried in St. Paul's, Covent-garden.
- Davy, Sir Humphrey (b. 1778—d. 1829), inventor of the safety lamp; one of the principal founders of the Zoological Gardens, Regent's-park. He lived, in 1820, at 28, Lower Grosvenor-street, Grosvenor-square, when he became President of the Royal Society. A portrait of him, by Sir T. Lawrence, hangs at the Royal Society, Somerset-house.
- Dawes, Sir William (b. 1671—d. 1724), Archbishop of York, lived at 24, Cecil-street, Strand. Educated at Merchant Taylors' School.
- Day, John (b. 1622—d. 1684), printer of Queen Elizabeth's time, "dwelt over Alder-gate."
- Decreey, John, Serjeant-painter to James I. and Charles I., lived in Shoe-lane, Fleet-street.
- De Foe, Daniel (b. 1661—d. 1731), author of "Robinson Crusoe," carried on the business of a hose factor in Freeman's-yard, Cornhill. He was imprisoned in Newgate, where he commenced his "Review;" he was buried in Bunhill-fields burial-ground.
- Denham, Lt.-Col. Dixon, (b. 1788—d. 1828), the African traveller. He was educated at Merchant Taylors' School.
- Denham, Sir John (b. 1615—d. 1688), architect and surveyor to the Crown, but best known by his poem of "Cooper's-hill." Built Burlington-house, Piccadilly. He was a student at Lincoln's-inn, and lived in Scotland-yard, Whitehall. Lies buried in Westminster Abbey.
- Denison, Mr. J. (d. 1806), lived and died at 16, St. Mary-axe, a street and parish in Lime-street Ward.
- Dent, Mr., the book collector, lived and had his fine library at 10, Hertford-street, Mayfair.
- Devereux, Robert, Earl of Essex (b. 1567—d. 1601). He lived in Essex-house, Strand. He was under surveillance in York-house for six months, in charge of Lord Keeper Egerton, and was confined in Lambeth-palace. His character was blackened by command in a Sunday's sermon at Paul's-cross. He was beheaded under the walls of the Tower of London, and buried in the church of St. Peter's ad Vincula.
- Devonshire, Wm. Cavendish, Earl of (d. 1628), lived and died in his house near Bishopsgate, buried in St. Botolph-without, Bishopsgate.
- Devonshire, Wm. Cavendish, Earl of (d. 1654), lived in "Little Salisbury-house," died in Newport-house, Long-acre, described as "neere Leicester-fields, in the suburbs of London."
- Devonshire, Wm. Cavendish, first Duke of (d. 1707), one of the heroes of the revolution of 1688. He lived in Salisbury-house, Strand, and afterwards in Newport-street, then in Montague-house, Bloomsbury, then in Arlington-house, St. James's-park. He died in Berkeley-house, which stood on the site of the present Devonshire-house, Piccadilly. Before Berkeley-house was built, Hay-hill Farm stood here. He was a member of the Kit-Kat Club, which first met in Shire-lane.
- D'Ewe, Sir Symonds (b. 1602—d. 1650), the journalist, lived in Dean's-yard, Westminster, and in Fleet-street.
- Dibdin, Charles (b. 1745—d. 1814), song writer, lived and died in Arlington-street, Camden-town; he lies buried in the Churchyard of St. Martin's-in-the-Fields, where a monument is erected to his memory.
- Digby, George, Earl of Bristol (b. 1609—d. 1672-3), lived in Beaufort-house, Chelsea, also in Queen-street, Lincoln's-inn-fields; this latter house was granted, by an ordinance of Parliament, dated 13th September, 1644, to Lady Brooke, wife of the fanatical Robert Lord Brooke.
- Digby, Sir Kenelm (b. 1603—d. 1665), lived in Holborn, between King-street and Southampton-street; also in St. Martin's-lane; also in a house on the site of Evans's Hotel, in the Piazza, Covent-garden, where he probably died.
- Dilly, Edward, bookseller and publisher, lived at 22, Poultry. Here Dr. Johnson met Jack Wilks at dinner, and here Boswell's "Life of Johnson" was first published. He is buried at St. George the Martyr, Queen-square, Bloomsbury.
- Disraeli, Isaac (b. 1766—d. 1848), lived at No. 6, west side of Bloomsbury-square, the first house from Hart-street. Here he compiled his "Curiosities of Literature."
- Dives, Sir Lewis (circ. 1637), lived on the south side of Henrietta-street, Covent-garden, in 1637.
- Dominique, Paul, lived in a large, plain, brick built house next the chapel, on the east side of St. Martin's-street, Leicester-square.
- Dodginton, George Bubb, Lord Melcombe (b. 1691—d. 1762), the Bubo of Pope, lived in Pall-mall; he was a member of White's Clubhouse.
- Dodsley, Robert (b. 1703—d. 1764), bookseller, originally a footman, lived in Pall-mall; he opened a shop here in 1735, with the sign of Tully's Head, and was buried at Durham.
- Dolben, Bishop of Bangor (d. 1633), lived in Bangor House, Shoe-lane, now Bentley's printing office; he was the last Bishop of Bangor who resided there.

Donne, Dr. John, poet (b. 1573—d. 1631), originally a student at Lincoln's Inn. He was vicar of St. Dunstan's-in-the-West, Fleet-street, and was imprisoned in the Fleet Prison for marrying Sir George More's daughter without her father's knowledge. He was buried, and a monument stood to his memory, in old St. Paul's Cathedral.

Dorchester, Henry Pierrepont, Marquis of, lived in Peter-house, Aldersgate-street, which stood nearly opposite Shaftesbury-house. It was converted into a prison by Cromwell, and subsequently bought by the see of London, after the Great Fire, for the episcopal residence.

Dorset, Cicely Baker, Dowager Countess of (d. 1615), lived and died in Great Dorset-house, Fleet-street, no longer standing; imprisoned in the Fleet "for pressing into the privy chamber, and importuning the King, contrary to commandment."

Douce, Francis (b. 1757—d. 1834), the antiquary, lived and died at 15, Upper Gower-street, Bedford-square; also at 34, Tavistock-place, Tavistock-square.

Doughty, William (circ. 1780—d. 1780), engraver of mezzotint portraits, after Sir Joshua Reynolds; lived at No. 4, Little Tichfield-street, Cavendish-square, in 1779.

Douer, Lord (temp. Charles I.); lived in Old Broad-street, Austin-friars.

Drayton, Michael (b. 1563—d. 1631), poet; lived "at the Baywindowe-house, next the east end of St. Dunstan's Church, in Fleet-street." A portrait of him hangs in Dulwich College. Buried, and a monument erected to him, in Westminster Abbey.

Drury, Sir William (d. 1589); built and inhabited Drury-house, Drury-lane; the Olympic Theatre now occupies the site.

Dryden, Erasmus, the poet's brother (circ. 1690), was a grocer in King-street, Westminster. He belonged to the Grocers' Company, and is described in the Grocers' books as one "who for many years has used the mystery of grocerie."

Dryden, John (b. 1631—d. 1700), poet, educated at Westminster School. He is said to have lived at 16, Fetter-lane, Holborn, but this is doubtful. He was married, on the 1st December, 1663, to Lady Elizabeth Howard, in the old church of St. Swithin's, by London-stone. From 1682 to 1686 he lived in a house on the north side of Long-acre, facing Rose-street, and he is styled in the rate-book John Dryden, Esquire (an unusual distinction in those days), the sum he paid to the poor varying from 18s. to £1. It was in the latter street that he was barbarously assaulted by three men hired for the purpose by Wilmot, Earl of Rochester. He also lived in Salisbury-court, Fleet-street, now called Salisbury-square, and in Gerard-street, Soho, in the house now numbered 43, where he died, in May, 1700. His body lay in state in the College of Surgeons, and was buried in Westminster Abbey, where a monument is erected to his memory.

Dudley, John William, Earl of (b. 1781—d. 1833); lived at No. 16, Arlington-street, Piccadilly.

Dudley, John, Earl of Warwick and Duke of Northumberland (b. 1502—d. 1553); lived in Ely-place, at which house the council met which formed that remarkable conspiracy which ended in the execution of the Protector Somerset.

Dugdale, Sir William (b. 1605—d. 1685-6), the antiquary and Garter King-at-Arms. The apartments of Garter King-at-Arms, at the north-east corner of the Herald's College, Doctor's-commons, were built at his expense in the reign of Charles II.

Duncombe, Sir John; lived in Charles-street, St. James's-square, one of its earliest inhabitants.

Dunmore, Lord (temp. George I.), one of the first inhabitants of Hanover-square.

Dunton, John (b. 1659—d. 1733), bookseller, author of that amusing publication, "His Life and Errors,"

lived, in the reign of William III., at the sign of the Raven, in Jewin-street, at the corner of Bull Head-court, Aldersgate-street. Here he published his "Athenian Mercury." He lies buried in Bunhill-fields burial ground.

D'Urfe, Tom (d. 1723). At No. 70, Queen's-Arm's-Tavern, Newgate-street, at a convivial meeting, he obtained the suggestion of his well known publication entitled, "Pills to Purge Melancholy." He lies buried in St. James's, Clerkenwell.

Dyer, Sir Edward (d. 1607), poet; lived in Winchester-house.

Proceedings of Institutions.

YORKSHIRE UNION OF MECHANICS' INSTITUTES.—The Council of the Union, in conjunction with the managers of the Yorkshire Penny Savings Bank, have organised a popular entertainment for the towns and villages of the county, in order to render the prevalent taste for amusement a means of imparting some useful knowledge. A thoroughly-qualified person has been engaged to give the entertainment, which will be illustrated by dissolving views, illuminated by the oxy-hydrogen light. The mechanical arrangements are most complete. Through the kindness of Lieut.-Colonel Akroyd, M.P., and Mr. Titus Salt, who have undertaken to contribute, if necessary, fifty pounds each, coupled with liberal donations from Earl de Grey, Sir F. Crossley, Bart., M.P., and other gentlemen, the entertainment will be given at almost a nominal charge.

EXAMINATION PAPERS, 1867.

The following are the Examination papers set in the various subjects at the Final Examination held in April last:—

(Continued from page 674.)

SPANISH.

THREE HOURS ALLOWED.

Candidates for a first-class certificate will have to translate an English passage into Spanish, to render in English or French several idiomatic phrases, and to write in Spanish a short essay.

Translate into Spanish:—

Morning scarcely had dawned through the balconies of the east, when five of the six goatherds got up and went to awake Don Quixote, whom they asked whether he continued in his resolution of going to see the famous interment of Chrysostom, for, if so, they would bear him company. Don Quixote, who desired nothing more, arose, and ordered Sancho to saddle and pannel immediately, which he did with great expedition; and with the same dispatch they all set out on their journey. They had not gone a quarter of a league, when, upon crossing a pathway, they saw six shepherds advancing towards them, clad in jackets of black sheep-skin, with garlands of cypress and bitter rosemary on their heads, each of them having in his hand a thick holly-club. There came also with them two gentlemen on horseback, well-equipped for travelling, who were attended by three lacqueys on foot. When the two parties met they courteously saluted each other, and finding upon inquiry that all were proceeding to the place of burial, they continued their journey together. One of the horsemen, addressing his companion, said, "I think, Signor Vivaldo, we shall not repent having stayed to see this famous interment; for, without doubt, it will be an extraordinary sight, according to the strange accounts these shepherds have given us of the deceased shepherd and murdering shepherdess." "I think so too," answered Vivaldo, "and, so far from regretting the delay of one day, I would stay four to see it." Don Quixote asked them what they had heard of Marcela and Chrysostom? The travellers said

they had met those shepherds early in the morning, and that, observing their mournful apparel, they had inquired the cause, and were informed of it by one of them, who told them of the beauty and singularity of a certain shepherdess, called Marcela, and the loves of many that wooed her, with the death of Chrysostom, to whose burial they were going. In fine, he related all that Pedro had told Don Quixote.

Don Quixote, translated by Jarvis.

Point out the irregularities of three verbs contained in the preceding paragraph.

Translate into English:—

Un caballero que iba á casarse, despues de confesado, entró en escrupulo, y so volvió á confesar; Padre, le dijo, no sé, si me ho confesado bien, pues veo que no me habeis impuesto ninguno penitencia. El confesor que era entendido, le respondió. ¿Pues no me habeis dicho, hijo, que os vais á casar?

Un bufon preguntó á uno que tenia las piernas torcidas, y la cadera derecha derrengada, que camino habeis tomado para ir á Cadiz? He venido todo derecho respondió. Pues, señor, en eso caso, os habeis furiosamente transformado en el camino.

IDIOMATICAL EXPRESSIONS.

1. Antes que te cases, mira lo que haces.
2. Escribe antes que des, y recibe antes que escribas.
3. Quien con lobos anda, á aullar se enseña.
4. Te amaré por los siglos de los siglos.
5. Es un caballero que tiene bien cubierto el riñón.
6. El nació de pies para ser nuestro escudero.
7. Cuando nos rotiramos llovía á cantaros.
8. Mi primo y su hermano eran uña y carne.
9. Siempre me da razones de pio de banco.
10. Al presentarse á mí, se le cayó la cara de vergüenza.
11. Mo hizo la oforta con la boca chica.

Write a short essay on the works of Cervantes.

Candidates for a second-class certificate will have to translate the half of the preceding extract, and five of the idiomatical expressions, and to answer some grammatical questions.

1. What is remarkable in all the Spanish verbs relating to the imperative?
2. Explain the irregularities of the verbs *oir*, *saber*, *exponer*, *prevenir*.
3. When is the word *but* rendered in Spanish by the words which it represents?

4. Write a short letter in Spanish on any subject.

Candidates for the third-class certificate will have to translate into English or French the following extract from Gil Blas, and to answer some grammatical questions.

Ya no podia mas el pobre eclesiastico, y presentandole yo un gran vaso del soberano especifico para que le bebiese. Quita alla, amigo Gil Blas, me dijo con voz desmayada, ya no puedo beber mas. Conozco que me es preciso morir á pesar de la grande virtud del agua, y que no me siento mejor, aunque apenas me ha quedado en el cuerpo una gota de sangre; prueba clara de que el medico mas habil y mas sabio del mundo no es capaz de prolongarnos un instante la vida, cuando llegó el termino fatal. Es ya necesario disponermene para partir al otro mundo. Anda, pues, y traeme aqui un escribano, que quiero hacer testamento. Cuando oi estas palabras, que ciertamente no me desagradaron, fingí entristecerme muchísimo, y disimulando la gana que tenia de ejecutar, cuanto antes, el encargo que me acababa de dar, como hago en tales casos todo heredero: Oh, señor, le respondi, dando un profundo suspiro, no está su merced tan malo, por la misericordia de Dios, que todavia no pueda esperar levantarse. No, no, hijo, repuso; esto ya se acabó. Estoy viendo que sube la gota, y que la muerte se va acercando; vé, pues, y haz cuanto antes lo que to he mandado. Conoci efectivamente que se le mudaba el color, y que iba perdiendo terreno por instantes; por lo que, persuadido que el asunto estrechaba, marché volando á ejecutar lo que me habia ordenado, dejando con el

enfermo á la señora Jacinta, la cual tenia aún mas en yo que nuestro canonigo se nos muriese sin tate. Entréme en casa del primer escribano que encontré. Señor, le dije, mi amo el licenciado Cedillo está acabado, quiere hacer su ultima disposicion, y no hay que perder tiempo. Que medico le asiste? me preguntó. El Dr. Sangrado le respondi. Pues vamos, vamos apremio. Puso él, cojiendo apresuradamente la capa y el sombrero porque ese Doctor es tan expeditivo, que no da lugar los enfermos para llamar al escribano. Es un hecho que me ha hecho perder muchos testamentos.—*Gil Blas*, lib. 2, cap. 11.

GRAMMAR.

1. Are the adjectives generally prefixed to their nouns in Spanish as in English?
2. Which are the rules for prefixing the adjective?
3. How is *that* translated into Spanish after English comparatives?
4. Write fully 400,000 *soldados*; 500 *fusiles*; *Carlos* the Fourth, the son of *Carlos* the Third.
5. How are translated into Spanish the verbs *to be* and *to be*, when they are followed by another verb in the infinitive? Give examples.
6. Explain the irregularities of the verbs *mover*, *creer*.
7. Translate into Spanish:—The bread is blessed. God has blessed you.

FREE HAND DRAWING.

THREE HOURS ALLOWED.

Candidates are not required to attempt all the following subjects:—

1. Draw the dog and the arm chair together or separate.
2. Make a drawing of a wagon-wheel in perspective from memory.
3. Make an original design, the subject being a dog. Answer the following questions:—
1. How many head-lengths are there in the figure?
2. How many face-lengths in the figure?
3. What proportion is the hand to the figure?
4. What proportion is the foot to the figure?

DIRECTIONS FOR THE LOCAL BOARDS.

Place a dog near a large arm-chair, for the candidate to draw from.

(To be continued.)

PARIS EXHIBITION.

The agricultural season of the exhibition is now in prime, and competitions of all kinds are taking place. There have been two shows of grapes in the reserve garden of the exhibition, which were well deserving more attention than they obtained. It was originally intended that the shows should apply at least as much to grapes for wine-making as for dessert, and the fruit was to be exhibited either on the vine itself or on cuttings with the leaves and tendrils uninjured. A very small portion of the exhibitors adhered to the conditions laid down, most of the grapes being exhibited in plates, some of the choice dessert fruit, such as the *Blanc de Grapes*, and the black muscat, in bunches weighing more than two pounds each, and the famous *Chasselas doré* of *Fontainebleau*. There are to be two more exhibitions of grapes, on the 1st and 15th of October, which are expected to be better supplied with the finer classes of wine grapes than the preceding; it is said that foreign countries will compete largely. This exhibition will also include other fruits; forty square metres have been accorded to Prussia, and Sweden is said to have asked for seventy.

An exhibition of pigs took place the other day at Billancourt, when the exhibitors were all French, and the pigs nearly all of pure or mixed English breeds. The ten prizes awarded, five were given to animals of

Berkshire, Yorkshire, Middlesex, and Suffolk breeds, one for crosses between New Leicester and Picardy, and Yorkshire and Craonnaise, with honourable mention for an animal of the mixed breeds of Middlesex, Berkshire, and Berrichon, and only three prizes to pigs of French breeds.

An important exhibition of horned cattle takes place next month at Billancourt, commencing on the 1st and ending on the 15th of October, including not only fat cattle but also those for breeding. It is said that the number of entries is very large, and that all the best French races will be well represented, but we hear nothing yet of contributions from other countries.

There has just been an exhibition of asses and mules at Billancourt, but the success was not great. There has also been an exhibition of dogs, when the number was large, but chiefly consisted of lap-dogs and other fancy animals. There were, however, some that presented real interest, such as the shepherd dogs of the Brie race, fine shaggy animals, that attack the wolf without hesitation, and a still larger and more powerful sheep-dog of Russian breed, a good deal like those of Brie, but with more character; this fine animal was shaved from the shoulders, with the exception of the tip of his tail, and, except his turned-up nose, looked like a lion. Several English exhibitors obtained prizes for large and small spaniels, retrievers, and other sporting dogs.

The free competition in steam and subsoil ploughing at Petit Bourg have commenced, and the operations are said to proceed in a most satisfactory manner; no results are, however, yet published. This competition has peculiar interest, from the fact that it is an attempt to do away with the system of prizes; the subscribers to the undertaking and a jury watch all the proceedings, and full reports will be drawn up and published.

Agricultural exhibitions and competitions are being carried on in all parts of the country, so that the present is an eligible period for the visits of farmers to France.

The last attempt to maintain theatrical entertainments of any kind in the park has been given up, by the final closing of the International and Chinese theatres, nobody remaining in the grounds, or even in the restaurants and cafés, long after the dinner hour; and the experiment of making an industrial exhibition a place of evening amusement may be looked upon as most completely disposed of. Nothing could exceed the dullness of the grounds after nightfall, or their gaiety during daylight; the Eastern buildings, the model factories, in short every building and object of interest out of doors, except where an extra charge was made for admission, have been, and still are, thronged with visitors; but upon no single occasion has there been more than a mere sprinkling of people after nightfall.

It is said that the total receipts to the present time amount to about £300,000, and that a sum of £60,000 more is required to meet all demands. If this statement be correct, the Imperial Commission has little to fear, for the present average attendance, multiplied by the forty days which remain of the season would yield more than the amount, and the visitors continue to increase in number. There is talk of a grand fête to take place on the occasion of the closing of the Exhibition, but nothing of an official character has yet transpired.

BRITISH ASSOCIATION, 1867.

IRON AND STEEL AT THE PARIS EXHIBITION.

MR. JOHN FERNIE, of Leeds, read a paper on the iron and steel at the Paris Exhibition. He said the duty imposed on English iron entering France had prevented the English iron masters from exhibiting at Paris. Very little iron was sent from England into France; the exception was a little of the best brands from Yorkshire; and a few of the Yorkshire best makers, and one or two others, exhibited the materials they usually supplied to their French customers. The French, on the other hand, had been making considerable progress in the manufac-

ture of iron, and no doubt prompted by a laudable desire to excel the English, had brought on the Champ de Mars an immense collection of iron work. It was not the intention of the writer to describe the whole of the collection. Most of it could be seen any day in our forges, but there were a few specimens shown which were worthy of attention. French architects had for a great many years specified for their new buildings solid rolled wrought-iron girders of all sizes, from floor joists and upwards, and a great trade had sprung up in France for this description of work, but little known in England. The largest girders of this description made in England were for our iron-plated ships, and were made as T irons, and welded up the centre. The girders exhibited by the Forges of Commentry were 3 ft. 7 in. deep and 12 in. on the flanges, and 12 ft. long, and would weigh about 22 cwt. The girders of Petit Gaudet and Company were 3 ft. 3 in. deep and 32 ft. long; these were larger than we had rolls for in this country. Girders should at least have a length equal to 16 times their depth. The girders of Commentry are only about three times longer than their depth, and for all practical purposes are useless. The girder of Petit Gaudet and Company is 10 times longer than its depth, but, considering the practical difficulties involved in piling, heating, and rolling, the writer contended the built-up girder of plates and angle irons was preferable. The process of stamping iron work was next discussed, and was described as a system by which a complicated forging, such as an engine wheel, was first forged in small pieces. These were then fixed together in their relative positions, then placed in a furnace and brought to a welding heat, when a few blows, in a set of dies attached to a large steam hammer, completed the process. But little had been done in this country by this system. One English house, however, exhibited samples of wheels quite equal to any exhibited by French houses. The pavilion of the Creusot Company was deserving of special mention. Plans and sections of the estate, showing the mines, the works, and then the minerals worked up into the finished engine, were shown. It had not been found profitable to conduct works of this kind in England. Here mining and iron manufacturing were often carried on together, but seldom engineering, which seemed to be a distinct branch, different branches having localised themselves in different parts of the country, away from the mineral districts. The engines exhibited were fair copies of English work. The educational studies of the children of the workpeople were worthy of the highest commendation. Prussia excelled us in the manufacture of steel in large masses. Those exhibited by Krupp and the Bochum Company far exceeded in size anything as yet manufactured in this country. The specimens of the Bochum Company were especially worthy of mention. The twenty-ton wheels cast together, and especially the locomotive cylinder, were the finest steel castings ever exhibited. So far as France is concerned, England had not been excelled in any department in the manufacture of iron.

Professor RANKINE asked Mr. FERNIE if he knew the process used by the Bochum Company.

Mr. FERNIE said he thought they could only be made by the crucible process, as by that process they could keep the steel till it had parted with all the gas contained in it, and so run it free from holes.

Mr. FERDINAND KOHN could state, from conversations he had had with the managers of the Bochum Company, that the Bochum steel was not manufactured by the crucible process. The mode of manufacture was a secret, but he believed the process consisted in the casting a material containing a greater quantity of carbon than steel, and afterwards subjecting these castings to a process of decarburisation.

Mr. FERNIE, in answer to a question from Mr. Le Neve Foster, said he did not know why the Great Eastern had given 40 locomotive engines to a French house to build. If it was to gain time in delivery, as had been stated, that would not occur again, as considerable

additions had been made by most of the locomotive builders in England, and some new houses had commenced locomotive building.

HUMAN EXCRETA.

By W. BRIDGES ADAMS.

It is written in the annals of the ancient Britons that, when the Romans had proved these islands to be not worth their holding, and abandoned them, the people or their rulers wrote a supplicatory letter to the Romans to come back and help them, for that "the barbarians drove them into the sea, and the sea drove them back upon the shores, and they knew not what to do in their sore distress." Just such is the condition of the sewage of great cities. Barbarous engineers drive it into the sea, and the sea drives it back on the shores, and the inhabitants in their sore distress know not what to do with it. The excretions of the lower animals are dealt with by distributing them over the surface of the land and absorbing them in various modes. We fold our sheep in moveable folds from one spot to another over the surfaces of our fields. We gather up the excretions of cows, and horses, and pigs, and employ other animals to transport them on to the land with the utmost care. And we go to great distances over the sea to gather up the deposited excretions of wild birds for the same purpose. In China the human excretions are carefully gathered alike from thin and thick congregations of people. In France, and Belgium, and Italy, the same thing is done. Round the environs of Nice private receptacles are provided for the traveller and passenger along the whole course of the cultivated land, and there is a well-authenticated story of a rural villa being taken by an Englishman with a large family, for a short term of years as a residence, and who had an action brought against him by the proprietor for loss of manure consequent on he and his family having been away some part of the time travelling, and the Englishman was mulcted in damages, the proprietor alleging that, according to the custom of the country, it was an important addition to the rent, and so considered.

But it is not so everywhere. In most countries where large towns and cities exist with dense populations, and where water is at hand, the water sooner or later becomes the receptacle for every matter, wet or dry, which the inhabitants consider to be a nuisance and not capable of being turned to profitable account. They are too busy or too careless to carry these matters away, and think that they have got rid of them because they have got them out of their sight. They forget that in this world nothing is lost. Matter disappears, but only to reappear in a better or a worse form. And the great receptacle for the detritus of the world is the sea. They who dwell by small streams give their offal to the current, which then joins the main river, and that again joins the sea. The old law terms, "flotsam and jetsam," are pregnant with meaning. All those substances which the sea cannot assimilate are cast upon the shores, from the "sea foam," which is said to furnish the material of German tobacco-pipes, down to the human excretions which line the beaches of Brighton, Hastings, Scarborough, and every other sea-bathing place, or place bathed by the sea, where delicate ladies and gentlemen lave their persons with sewage furnished by the maritime population.

I was once embarking in a shore boat in the Bay of Cadiz. My umbrella—an iron-mounted one—fell overboard. The boatman, with a long, slender, lance-like boat hook, picked it up from some twelve feet of salt water. It was loaded with the filthiest, foulest, blackest, sewer mud, such as the Thames in its very worst condition could scarcely have matched. I abandoned it in utter disgust. Now, this Bay of Cadiz has been exposed to the wash of the Atlantic ever since it existed, the population is necessarily small on a spit of land, but there the human excretions have gone on accumulating for ages.

Take again, the harbour of Marseilles, where "the sea of ease" float on the water—the most perfect of closets that can be imagined, where the valves are out of order and there are no pipes to clog. A sea comes up, with its paddles lashing the surface, stirring up from the lowest depths the rotting of the earliest colonists mingled with every successive down to the present year of 1867. Sweep the Mediterranean round, and such is the condition near every seaport town, save, perchance, where the current sets directly through the Straits of Gibraltar into the harbour of Rio de Janeiro, where again are found the foul mud banks. Go to China, or elsewhere where perennial fevers are, there will be found the same filthy slime. And the better the inhabitants are fed, the richer they are, the worse will be the condition of the surrounding sea. The sea is the great pickling vessel that resists the cess of putridity so long as the matter is beneath waters, but when washed up along the shores exposed to the air and sun, it festers and gives forth noxious vapours.

There have been many manure companies to remove open-air deposits of birds' excretions. It would be the while of a company to work these under water, of human excretions on the seashores and ports. The time as they cease to be formed, by common sense to the rescue, and disenchanting us of that hydra which has been fostered by ignorance and quackery, though the secondary power of gravitation were used, and better vehicle of transit than the primary power of elasticity. Time was that Moses commanded a man to have a paddle or spade at the end of his cane for sanitary purposes; and when George III. was King an Act of Parliament forbade, under a penalty of £100, any man from voiding the contents of his cesspools into the common sewer, and when this was done summarily, the rough navvie who discovered it was accustomed to come to the owner to examine the premises, which was usually on very crisp paper, the name of Henry Hase appended to it. And a plan was required every year. In short, it was a "black mail" to escape impeachment. And now the Act of Parliament subjects to a fine all those who connect their cesspools or drains with the sewer without notice. In short, mainly owing to the persevering action of one man, who was a bigot to the faith that it was the cheapest of all carriers, because he once saw a mass of mud swept out of a reservoir by a stream of water, the river Thames was gradually brought to the condition of an "elongated cesspool" by the aggregation of all the filth of London on its way to the sea. The floating baths vanished, so did the fish, and when the thermometer rose to 70° and 80°, the curative power set up by nature, changing the filth into gas, rising into the upper air, gradually got rid of it, if the filth lasted long enough. But it offended the nostrils of the legislators in St. Stephens', who suddenly became aware of the fact that filth which is supposed to have been washed away will crop out somewhere, and so they put the matter bodily over to the Board of Works, with power to levy taxes, and finally dispose of it in a bottomless pit, in which it should lie interred for ever.

So the Board of Works, after much manufacture of words, made some thirty-six miles of gigantic tunnels on the north bank of the Thames, and a proportionate quantity on the south, cutting off the Stygian stream wholly from the upper river, and discharging it into the lower river at Barking-creek and Crossness, or thereabouts, and at this the fish have rejoiced, and begin to reappear. And the Board flattered themselves that the foul fiend was quelled for ever. But one day, if report lies not, he appeared, and bearded them to their very worshipful noses, in the very fountain-head of their authority, at Syon House gardens, filling the chambers and offices of the immortal chiefs, and their more mortal followers, with an un-

stable and unmistakable stench. Every one was at wit's end, and the garrison was nearly routed; but a plumber was found equal to the occasion. He kicked the offender by his nose, and found that he issued at the sewers directly through the wastepipe of the barn, and this in the teeth of the printed programme, that no gas could exist in the sewers, for that the water would wash it all away."

Low dirty gas will run up hill, if there be a passage for it, as certainly as dirty water will run down hill, and the interior of the sewers is more favourable to the generation of foul gas than the open river is, for the temperature is always elevated. In short, within the sewers is not a summer climate. And as all house drains descend into the sewers, the gas will ascend into the houses if not effectually stopped out, or carried off by chimneys or chimnies of sufficient area. The stoppers to

houses consist of water-traps, which may or may not be in good order; but if in the best possible order, the gas under pressure will pass through the water, as surely as common house gas does through water meters. And it is that the most elevated sites in connection with the main-drainage system are in the most unfavourable position, and the Fleet sewer poisons portions of the most elevated heath. Experiments have been made to convert the rain-pipes of houses into gas drains, but generally with the effect of carrying it into the attics, and some eleemosynary ventilation has been sought for from factory chimnies, but with no satisfactory effect.

There is yet another question. At present the outfall at Barking-creek, introducing the noxious matter to the close proximity of the salt water; and the result will be a black bank, like that at Cadiz and Marseilles. But we are informed that this arrangement is only temporary, and that the final place of deposit is to be the shallow sands, some forty miles from Barking, which are to be reclaimed and converted into pasture-lands, whereon the London sewage is to be changed into milk and butter for the supply of London markets. Assuming it to be so, the question arises as to the comparative cost of transit, in the dry or moist state, or in the enormous bulk of floods of water.

To begin at the beginning, what are the ingredients of sewage? The refuse of gas works, chemical works, leather dressers, soap works, and manufactories generally. With regard to the gas works, there was a time when they ejected their ammoniacal liquor, called "blue billy," into the river and poisoned the fish; but that time is gone, and almost all their coal refuse is found to be convertible into a most valuable manure. All manufacturing refuse, as well as that of slaughter houses, is too valuable to find its way into the sewers, in the mere interest of their producers. The next question is of the water used in baths and wash-houses mixed with soap, and that used for washing floors. This, though a very good manure, is not worth the saving, and is not a nuisance, and may, therefore, be suffered to run into the river or anywhere else. Then follow the animal droppings in the streets, which should be carried to the stable yards and treated as stable manure, together with decayed vegetables and refuse food. All this goes away dry or moist, and has nothing to do with the sewers. What then is it that makes sewage a nuisance and overwhelms us with its poisonous stench? Only the excretions of human bodies.

Every day comes into our dwellings the food we consume. We put it carefully into safes and closets, accessible to light, air, and inspection. When we have consumed it and passed it through our bodies, it is reduced in bulk to a mere fraction of what it was. It has disappeared mainly in gases. The remnant we deposit in dark holes, with neither air, light, nor power of inspection, and we encourage it to decompose by mixing it with huge volumes of water. In the old cesspool time we kept it in a dark hole underground till we had a seven years' accumulation, in a position carefully made as

inaccessible as possible, and utterly unfit for cleansing purposes. At the present day we deposit it in a dark hole and wash it down with water. Now, as the food for our consumption is brought in day by day, it follows that the remnant, which is not 10 per cent. of the original bulk or weight, could without difficulty be carried away by one-tenth of the vehicles that brought in the original bulk, if done daily; and the expense of taking it by cart, van, boat, or rail, on to the land, would be immeasurably less than that of our present closets, pipes, and machinery and water supply.

The objection arising is, that it would be needful to reconstruct all the waterclosets in London, and alter the houses at a great expense. No doubt. Like all badly-arranged systems, change for the better must involve expense. Then again it is alleged that it would be a constant nuisance, and necessarily a greater nuisance than the daily cleansing of every bedroom in London. If it could be demonstrated that fifty houses could be so treated advantageously, it would be simple multiplication to treat all London so. It would come about by degrees. One of the most marvellous things of our daily life is the precision with which the daily food of near three millions of people arrives in the exact quantities needed. Yet there is no real marvel in it. It has come about by degrees, and every one is trained to the part he has to perform. As to nuisance there are many practical means of providing against that. It is the failure to remove day by day, as fast as it is produced, that is the chief source of the putrefaction. Once make it a trade and a source of profit, it will settle down into a daily routine, and people will wonder why it was not done before.

The experience would be best gained in a small community. At this time there is a seaside village about 50 miles from London, containing about 1,200 inhabitants. It has no drainage proper. It is on a chalk soil, varied with sand and clay. The houses are about 220 in number. In the back yard, which usually measures about 20 square yards superficial, two holes are dug within a few feet of each other, one for the privy, 8 to 10 feet deep, the other for the well, about 30 feet deep, and usually so arranged that the privy can filter into the well. The streets have side channels, formed of bricks or of flint stones. Several pigstyes also exist. After dark the inhabitants appear to draw water from these wells to sluice out their yards and privies, the liquid running down the gutters to a large open cesspool at the town's end, and from thence it flows in a covered drain to another open cesspool situated in the dried-up bed of an old harbour. At high tide the sea-water washes through a shingle bank and into the cesspool, and spreads its contents around, poisoning the atmosphere, which is fortunately neutralised by the sea air, otherwise the inhabitants of two convalescent hospitals would remain invalided. There is plenty of garden land and fields close to the town, but though the farmers send their carts in for stable manure and slaughterhouse refuse, they will have nothing to do with the drainage sewage. They say that it is spoiled by the water, but they would gladly take it if without sea-water, which pickles it, and in a transportable condition.

Speculators, animated by the lucre of gain, have cast their eyes upon this secluded place with a view of making it a watering-place, and making fortunes by building. So long as the population was under 1,000 the nuisance was very mild and amenable to ventilation, but if the population increases to 2,000 the chances are that an epidemic will decimate them, and so the speculators are urging on a system of drainage on the usual stereotyped plan. First, a deep sewer is to be made, of some two miles in length; then drains are to be made to connect it with each house, to run the matter into the sea; then all the privies are to be formed into waterclosets. And when all this is done a water supply must be formed either by a reservoir on the downs or by a chalk well, and pumping apparatus with the usual

concomitants of pipes and cisterns. That this would cost many thousand pounds is quite clear, and if the sewage is to be utilised there must be another large outlay in pumping machinery for that purpose. If not so utilised the visitors will continue to bathe in it as it is washed along the shore.

Now it is a very practicable thing to dig out the cesspools and fill them up with chalk, and then to replace them by a shallow tray of slate or cast-iron, with a gently-sloping bottom at the level of the ground, something similar to the shallow wooden box in which bricklayers mix their sand and lime for mortar. Pulverised chalk—to be had in any amount—placed in this tray, would receive and absorb the focal matter, putting it into the condition of mortar; and in that state the farmers would gladly cart it away every day, or two or three days. The wells would thus be free from impurities, and would quickly attain a wholesome condition.

The cost of the alteration would scarcely exceed forty shillings per house, or under £500 for the whole town. The annual value of the materials, according to agricultural estimates, should be £600. In some few new houses which have been built there are water-closets, but they are connected to porous cesspools, poisoning the water supply. In building other houses, saving the cost of the water-closet would be a material advantage, saying nothing of the cistern.

In criticising the sewage system of London as a fallacy in principle, I am far from denying its existing utility. Before it was commenced I discussed it with a then member of the Board of Works, and we both arrived at the same conclusion—that the mass of filth was so great that it was absolutely necessary to turn a river through the Augean foulness to carry it off in flood. The cesspools, wherever they were on porous soil, were not gathering pits but distributing pits, polluting the whole subsoil far and near, just as the gas pipes are now doing, to such an extent that it would be worth while to dig up the ground for two feet round them and use it in a secondary condition to charge the gas retorts and reproduce it.

If this system of water cleansing and underground sewers is to continue, the quantity of water required will be continually on the increase, and it will be absolutely necessary to erect shafts at short intervals along the line of the sewers, and of considerable height, to carry off the noxious gases constantly generating. When the time comes that we cease to require water for the closets we shall have a greater supply for our baths, and the Board of Works will have ample work cut out for them in the future, for the physical government of this great metropolis.

Fine Arts.

ENCOURAGEMENT OF MUSIC IN FRANCE.—An Imperial decree, founded on a report made by the Director-General of Theatres to the Minister of the Beaux Arts, was published last month, respecting the encouragement of musical composition. The Director-General, M. Camille Doucet, says, that while the other fine arts have the advantage of public exhibitions, musical compositions can only be heard in private establishments or at theatres, the admission to which is difficult for the public at large, and that the managers of the lyrical theatres are compelled, in their own interest, to perform the works of popular or recognised masters, to the almost total exclusion of young composers; that there is also another difficulty in the way of the young musician, who, to obtain a libretto, is compelled to seek an associate in his labours, and often fails in this, or suffers by the incompetence of his collaborateur. Means have been taken of late to afford the laureats of the Conservatoire opportunities of having their compositions performed in one

or other of the operatic theatres; and the new establishments competitive performances at the three theatres of Paris; at the Opera there are to be two competitions, one for a poem in three acts, and the other setting the prize poem or libretto to music. At the Opera a poem, also in three acts, is to be selected by the director, and then submitted to a competition among composers; while at the Théâtre Lyrique, in the absence of any restrictions whatever as to its origin. The compositions, as well as the libretto, are to be submitted to the decision of juries elected by the competitors themselves. The successful works are to be performed at each of the three operatic theatres within a year from the period of the prize awarded; the others may be performed in the provinces, and with this view directors of operatic theatres are admitted to the final performances of the competitors before the juries. In pursuance of the plan here set out, it is decreed that three competitions be immediately opened. At the Opera, libretti are to be sent in before the 15th of December in the present year, and the prize poem will be offered for composition during the month of February to July inclusive, of the coming year. The prize for the selected poem is 3,000 francs (£150), in case neither of the libretti shall be deemed worthy of being set to music, then the best of those offered will receive half the amount of the prize. The cost of the prizes is divided between the Ministry of the Beaux Arts and the Director of the Opera. The competition for the poem opened at the Opera Comique on the 30th of the month, and that for the composition of the prize poem is announced for the 1st May, 1868. The competition at the Théâtre Lyrique also opened in August, and will close on the 16th of the same month next year. The jury in each case consists of nine members. Should a musical composition be deemed the best of those presented, but not sufficiently meritorious to be performed in Paris, the author of it will receive a secondary prize equivalent to £80. The competitions at the Grand Opéra are open to all French composers, even though they have had an opera performed there or elsewhere. Those who have had a composition of more than one act performed at the Opera or the Opera Comique are excluded from the competition at the latter theatre. Lastly, those who have had an opera of more than one act represented at either of the three operatic theatres are excluded from the competition of the Théâtre Lyrique.

Manufactures.

SWEDISH INDUSTRY AT EXHIBITIONS.—The first industrial exhibition at Stockholm was held in 1823, when there were but 62 exhibitors and 436 objects shown; the second, in 1834, had 290 exhibitors and 2,062 articles exposed; the third, in 1840, 200 exhibitors and 1,000 objects; the fourth, in 1844, 210 exhibitors and 1,200 objects; the fifth, in 1847, 243 exhibitors and 2,007 objects; the sixth, in 1851, 278 exhibitors and 2,687 articles shown. These exhibitions were of a character purely provincial, but of a growing importance, and of late years were held simultaneously with the great agricultural meeting. The last local exhibition of Stockholm, in 1866, was a collective one for the Scandinavian kingdoms and Finland, and the number of exhibitors and objects shown was as follows:—

	Exhibitors	Objects
Sweden	2,200	2,485
Norway	590	670
Denmark	422	481
Finland	263	319
	3,418	3,910

The Fine Arts' Exhibition for the four countries, which took place at the same time, gives the following results:—

	Exhibitors.	Objects.
Sweden	99	355
Norway	53	169
Denmark	54	109
Finland	18	46
	224	679

Passing now to International Exhibitions, the number of Swedish exhibitors who took part were—at London, in 1851, 117; at Paris, in 1855, 417; at London, in 1862, 608; and at Paris, in 1867, 545. The number of rewards carried off by Sweden this year at Paris was five gold medals, 32 silver medals, 75 bronze medals, and 80 honourable mentions. Also a grand prize of 1,000 francs to the Company Höganaäs (colliery and grand industrial establishment).

MANUFACTURES IN SWEDEN.—In 1865 there were 2,315 manufactories of different kinds in Sweden, employing 30,085 workmen, besides 168 temporarily closed. The greatest number and the most active of these were in the governments of Gottenburg, Ostergothic, and the town of Stockholm. The motive power of the different factories was equal to 7,812 horses. The number of factories where cattle was employed was 140; those using hydraulic power, 409; and compressed air, 225. The factories, &c., included 15 cotton mills, with 1,522 workmen; three flax mills, with 108 workmen; 18 for cotton yarn, with 2,531 workmen; 10 sugar refineries, with 1,090 workmen; 85 cloth manufactories, employing 3,591 hands; 97 machine workshops, employing 4,927 persons; 95 tobacco manufactories, with 2,393 hands; 658 tanneries, with 1,749 workmen; 73 paper works, with 1,613 workmen; 12 candle works, with 198 workmen; 22 glass works, with 1,221 workmen; 42 oil works, with 180 hands; 12 soap works, with 95 men; 412 dye works, with 944 hands; nine wool-spinning works, five silk-spinning works, and two porcelain works, with 549 hands.

Commerce.

COAL IN PRUSSIA.—It appears by the report of Mr. Consul-General Crowe, of Leipsic, that the coalfields of the valley of the Ruhr extend over a surface of 115 square miles, and are supposed to contain about 40,000,000,000 tons of fuel. The production in 1855 amounted to 3,252,223 tons, and the number of hands employed was 22,235; in 1865 the production reached 8,535,614 tons, having nearly trebled itself in the ten years, and the number of hands employed had increased to 39,871. The price of coal at the pit's mouth was, on an average, for best, 5s. 6d. per ton in 1866. The wages of the coal districts vary from 11 sgr. (about 13d.) for boys, to 2s. and 2s. 6d. for men for a day of ten hours. Labourers who earn more do so by extra exertion in the mines where piecework is usual. The difference between the district and similar ones in England is that you find there cheaper wages and longer hours of work, and, as a consequence, cheaper coal at the pit's mouth than in Great Britain. The carriage of coals on railways being on an average four-fifths of a halfpenny per ton per mile, and the chief centres of Rhenish industry being close to the collieries, machinery can be driven less expensively there than in England. A network of railways unites the collieries with all the great towns of the neighbourhood—Duisburg, Düsseldorf, Elberfeld, Barmen, Hagen, Iserlohn, Witten, Dortmund, Essen, and Ruhrort. A steam ferry takes the coal over the Rhine at Ruhrort into the silk and cotton manufactories of Crefeld, Viersen, and Gladbach. At Ruhrort a vast harbour, formed by the confluence of the Ruhr with the Rhine, serves as port of shipment for the coal, which is towed up to Mayence and Mannheim in barges. At

Duisburg shipments are made from the quays of the Rhine. The war of 1866 curtailed the facilities of transport, and withdrew men from productive labour, and the hands employed on the Ruhr coalfields were reduced to 37,686; but through a more general use of machinery the production of the year slightly increased, and reached 8,583,362 tons. New railways increase the export of produce, and year by year the area over which the export of Ruhr coal takes place is extended. Little or no English coal is now sent inland from Antwerp, Rotterdam, or any of the Dutch and Belgian harbours. The Ruhr collieries feed the great industrial centres of the Lower Rhenish provinces, and compete with England in the Dutch and North German markets. The coalowners are striving for new communications to the westward, and there is no doubt that if they could rival England in the quality as well as in the price of coal they might push us hard enough in certain quarters. They admit the superiority of English sea coal, but they may, and perhaps do, calculate on the possible exhaustion of Great Britain. It is scarcely possible to describe the pleasure and excitement caused in the Ruhr districts by the fact that in 1865 and 1866 Westphalian coal was carried with profit to the Belgian coal basins of Charleroi and Mons, and even over the frontier into France. None of the coal mines exceed 150 fathoms in depth; some have double, most have but one shaft divided by hoardings into halves for the passage of air and the working of the cars. Substantial buildings cover the shafts, and contain the necessary steam engines and boilers. The seams are numerous, and are worked at various levels from the same shaft. Some seams are as thin as 2½ feet; the thickest are rarely above 4½ feet. The quality of the coal is various. A great number of the labourers in the Ruhr coal districts are vagrant. They do not universally keep to mining as the business of their life. They are prone to change, and the same hand turns to two or three different occupations in the same number of years. They have yet shown no desire to combine or to form trades unions. There is nothing organised among them, except a society for advancing necessities on a certainty of repayment from wages at monthly intervals. The workmen complain of competition among each other. The owners of mines, on the contrary, complain that labour is too scarce, and threatens to be too dear, so that there are limits to the expansion of works.

Colonies.

GOLD IN MELBOURNE.—The total amount of gold exported from the colony of Victoria since the commencement of this year is 7,940,65 oz., of which 83,348 oz. were transhipped from New Zealand. During the corresponding period of the previous year the entire quantity exported was 7,578,48 oz., of which 1,338,84 oz. were from New Zealand.

THE POST-OFFICE IN VICTORIA.—There are 555 post-offices in the colony of Victoria, and, according to the annual report, the total number of town and country letters posted in 1866 was 6,650,000. There are 203 people employed at the General Post-office in Melbourne. 8,631,133 letters have been received here and dispatched, and 5,138,388 newspapers. 11,257,974 stamps were issued out of 12,665,693 manufactured. The total cost to the colony of the English mail service was £28,774, of which £21,542 was received for postage, leaving a deficiency of £7,232. £60,119 money orders, representing £218,850 were issued against £50,666, representing £186,855 in 1865. 5,703 accounts were opened at the New Post-office savings bank, the number remaining open at the end of the year being 6,774, of which 5,929 represented sums not over £20. £85,381 was received, and £43,348 paid. The amount of deposits at the savings bank on the 31st December, 1866, was £58,690. The balance on the 1st January, 1866, was

£15,467. The repayments during the year were **£43,348.**

SOUTH AUSTRALIAN PRODUCE.—The total value shipped during the quarter ended June 30, 1887, is **\$521,926**, of which **\$419,899** went from Port Adelaide. The latter amount includes **\$137,483** value of mineral, and **\$237,693** of bread stuffs.

FARMS IN VICTORIA.—For some years past the agricultural statistics published in Victoria have included tables exhibiting the acreage of the different farms arranged in various classes. From the tables prepared there are (including squatters) **11,561** landholders in the province, occupying in the aggregate upwards of eight millions of acres of land. Between **1** and **5** acres there are **1,188** persons, holding among them **3,114** acres; between **5** and **15** acres there are **992** persons, holding among them **8,408** acres; between **15** and **50** acres there are **1,264** persons, holding among them **37,608** acres; between **50** and **100** acres there are **2,214** persons, holding among them **169,110** acres; between **100** and **200** acres there are **2,713** persons, holding among them **392,492** acres; between **200** and **350** acres there are **1,715** persons, holding among them **445,017** acres; between **350** and **500** acres there are **601** persons, holding among them **248,116**. Beyond **500** acres there is no classification, although there are many farms where grazing is combined with agriculture, and even where it is not, that are of larger area than **500** acres.

Notes.

TRANSFORMATIONS IN PARIS.—An immense place is in course of formation near the site of the oldest fountain in Paris, that of the Château d'Eau, where the new Boulevards of Prince Eugène and Magenta join the old ones of Saint Martin and the Temple; the space laid open by the junction of these four grand roads is very large, and in the centre of it a large place is being prepared for a magnificent fountain, around which will be broad promenades for pedestrians, who will thus escape the dangers arising from the meeting of so many roads at one spot. But the most remarkable work of the kind is the transformation of the famous old hill of Montmartre and all the surrounding district; the new Boulevard Magenta is being carried through the district, and will eventually communicate with a grand new road to connect Paris and Epinay; and the Butte Montmartre, like its sister, the Butte Chaumont, after supplying Paris with plaster for centuries, will be connected with a large public garden. Those who visit Paris before the termination of the Universal Exhibition, and desire to form an idea of the magnitude of the demolitions and changes carried on in the streets and roads of Paris during the last few years, should not fail to visit the two spots in question.

DISCOVERY OF ROMAN COINS.—A very remarkable discovery of Roman money has just been made in the very heart of Paris, in one of the courts of the Lycée Napoleon. A few coins were discovered only a few feet beneath the surface of the soil, and upon further search no less than **715** pieces of money, all in gold, have been brought to light. A large proportion of these coins are in excellent preservation. They are of the time of Nero, Vitellius, Vespasian, Titus, Domitian, Trajan, Antoninus, Marcus Aurelius, Commodus, Septimus Severus, the latest in date being those of Caracalla. No other Roman vestiges accompanied the coins.

BOTANICAL NOMENCLATURE.—A botanical congress met in Paris on the 16th of August, and continued its labours until the 28th. There was a good attendance of botanists from various countries, under the presidency of M. A. de Candolle, of Geneva, and some interesting papers were read, which are to be incorporated in a report. The important fact, however, is the adoption of a code of regulations for botanical nomenclature, drafted

by M. de Candolle, revised by a commission afterwards discussed at a full meeting of the society, the presidency of M. Dumortier, a member of the Belgian chamber of deputies. The code, which consists of 69 articles, was finally adopted unanimously as a guide for botanical nomenclature, and is to be published.

Journal of the Society of Arts.

FRIDAY, OCTOBER 4, 1867.

Announcements by the Council.

ARTIZANS' VISITS TO PARIS.

Her Majesty's Government have transmitted to the Society of Arts, in aid of the fund raised by the Society for assisting workmen, specially selected from various trades, to visit and report on the Paris Exhibition, the sum of £500, which was granted conditionally on the Society raising a like amount by public subscription.

The amount received up to the present time is as follows:—

H.R.H. THE PRINCE OF WALES,					
President	£31	10	0		
Society of Arts	105	0	0		
Other Subscriptions already published	382	4	0		
Jacob Brett				2	2
HER MAJESTY'S GOVERNMENT.. .. .	500	0	0		
Total	£1,020	16	0		

Subscriptions may be forwarded to the Financial Officer, at the Society's House.

PRIZES FOR ART-WORKMEN.*

The Council of the Society of Arts hereby offer Prizes for Art-Workmanship, according to the following conditions:—

I. The works to be executed will be the property of the producers, but will be retained for exhibition, in London and elsewhere, for such length of time as the Council may think desirable.

II. The exhibitors are required to state in each case the price at which their works may be sold, or, if sold previously to exhibition, at what price they would be willing to produce a copy.

III. The awards in each class will be made, and the sums specified in each class will be paid, provided the works be considered of sufficient merit to deserve the payment; and, further, in cases of extraordinary merit additional awards will be given, accompanied with the medal of the Society.

IV. Before the award of prizes is confirmed, the candidates must be prepared to execute some piece of work sufficient to satisfy the Council of their competency.

V. *Bona-fide* Art-workmen only can receive prizes.

VI. Although great care will be taken of articles sent for exhibition, the Council will not be responsible for any accident or damage of any kind occurring at any time.

VII. Prizes may be attached to articles exhibited and sales made, and no charge will be made in respect of any such sales.

VIII. All the prizes are open to male and female competitors, and in addition, as regards Painting on Porcelain,

* The Worshipful Company of Salters contribute £10 annually to this prize fund. The Worshipful Company of Clothworkers contribute £10 10s. to this prize fund. The Worshipful Company of Goldsmiths contribute £15 "for the encouragement of workmen in the precious metals." Particulars of the Goldsmiths' Company's prizes are given. The North London Exhibition prize consists of the interest of £167 7s. 3d., invested in the name of the Society of Arts, to be awarded by the Council "for the best specimens of skilled workmanship" at the Society's Exhibition of the works sent in for the prizes named above.

Cameo-cutting, Engraving on Glass, Decorative Painting, and Wall Mosaics, a second set of prizes, of the same amounts, will be awarded among female competitors. If a female desire to compete in the female class only, she must declare her intention accordingly. The originals of the works prescribed may be seen at the South Kensington Museum.

IX. Any producer will be at liberty to exhibit, either in his own name or through his workmen, any work or works as specimens of good workmanship, in the various classes, provided that the work or works be accompanied with a statement of the name or names of the artizans who executed their respective portions; and if the work or works be sufficiently meritorious, extra prizes will be given to the artizans who have executed them.

X. Artizans may, if they think fit, exhibit works executed by them after other designs than those stated above, in any of the classes. Such works may contain the whole or portions of the prescribed designs, and must be of a similar style and character. Competitors must specify the class in which they exhibit. If the works be sufficiently meritorious extra prizes will be awarded.

XI. All articles for competition must be sent in to the Society's house on or before Saturday, the 21st of December, 1867, and must be delivered free of all charges. Each work sent in competition for a Prize must be marked with the Art-workman's name, or, if preferred, with a cypher, accompanied by a sealed envelope giving the name and address of the Art-workman. With the articles, a description for insertion in the catalogue should be sent. The works will be exhibited at the Society's House, and afterwards at the South Kensington Museum.

Casts may be seen at the Society of Arts, Adelphi, London, and the Schools of Art at Edinburgh, Dublin, Manchester, Glasgow, Birmingham, and Hanley in the Potteries.

Photographs and rough casts in metal, &c., may be purchased at the Society of Arts, John-street, Adelphi, at the prices named.

The plaster casts of the examples in classes 2 and 4 (except bas-relief 4a) may be obtained from Mr. Franchi, 15, Myddelton-street, Clerkenwell, E.C.; the other casts from Mr. D. Brucciani, Galleria delle Arti, 40, Russell-street, Covent-garden, W.C.

. The Council are happy to announce that several of the works which received first prizes in the competitions of 1863, 1864, 1865, 1866, and 1867, have been purchased by the Department of Science and Art, to be exhibited in the South Kensington Museum and the Art Schools in the United Kingdom.

FIRST DIVISION.

WORKS TO BE EXECUTED FROM PRESCRIBED DESIGNS.

For the successful rendering of the undermentioned designs in the various modes of workmanship according to the directions given in each case.

CLASS 1.—CARVING IN MARBLE, STONE, OR WOOD.

(a.) *The Human Figure*.—One prize of £15 for the best, and a second prize of £7 10s. for the next best, work executed in marble or stone, after part of a frieze of a chimney-piece, by *Donatello*, No. 5,795, in the South Kensington Museum; or a relief in terra cotta, *Amorini* supporting an entablature; original in the South Kensington Museum, No. 11,940. Dimensions—Two-thirds the size of the cast (linear).—The design may be adhered to strictly or adapted to any architectural purpose.

[Cast—Fifteen Shillings; Photograph—One Shilling.]

(b.) *Ornament*.—One prize of £10 for the best, and a second prize of £5 for the next best work, executed in marble, stone, or wood after a carved chair-back in the South Kensington Museum. Dimensions—To be two-thirds of the cast (linear).

[Cast—Twelve Shillings; Photograph—One Shilling.]

(c.) *Ornament*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed in stone, after a *Gothic bracket* in the Architectural Museum. Dimensions the same as the cast. In this design the details may be improved by the introduction of small animals, and the human head may be changed according to the taste of the art-workman.

[Cast—Ten Shillings; Photograph—One Shilling.]

(d.)—One prize of £20 for the best, and a second prize of £10 for the next best, work carved in wood after a panel in carved oak. Original in South Kensington Museum, No. 874. Dimensions—Optional.

[Photograph—Sixpence.]

(e.)—One prize of £15 for the best, and a second prize of £7 10s. for the next best, work carved in wood after the entablature of a chimney-piece carved in wood, in the South Kensington Museum, No. 85.'64. Dimensions—Same size as original.

[Photograph—One Shilling.]

(f.) *Ornament*.—One prize of £10 for the best, and a second prize of £5 for the next best, work carved in wood after an *Italian picture frame* in the possession of Henry Vaughan, Esq. Dimensions optional.—This design may be adhered to strictly or adapted in such manner as the workman may think fit.

[Photograph—Two Shillings.]

(g.) *Ornament carved and gilt*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed in wood, carved and gilt after a *Console Table* in the South Kensington Museum, No. 6,497, of the period of Louis XVI. The work to be carved roughly in wood, then to be prepared in the white by a gilder, then cut up or carved in the white by the carver, then to be gilt in mat and burnished gold. As such work may probably be executed by two persons, the prize will be apportioned as the judges may determine.

[Photograph—One Shilling.]

CLASS 2.—REPOUSÉE WORK IN ANY METAL.

(a.) *The Human Figure as a bas-relief*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after the Martelli Bronze Mirror Case, No. 8,717, in the South Kensington Museum—dimensions, 6½ inches diameter; or a panel in low relief, the Virgin and Child, in South Kensington Museum, No. 66.'66. Dimensions—One-third of original.

[Cast of Mirror Case—Two Shillings; Photograph—One Shilling. Cast of Bas-relief, 3s. 6d.]

(b.) *Ornament*.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after a tazza in silver, date 1683, the property of Sir W. C. Trevelyan, Bart., now in the South Kensington Museum. Dimensions—The same as the model.

[Photograph—One Shilling.]

CLASS 3.—HAMMERED WORK, IN IRON, BRASS, OR COPPER.

Ornament.—One prize of £7 10s. for the best, and a second prize of £5 for the next best, work executed after a knocker in wrought iron, in the South Kensington Museum, No. 9,007.

If the work is executed in brass or copper, it should be rendered subject to the conditions of these metals, either as split and riveted or partly beaten from the sheet, and the awards will be made in view of these conditions. The work must not be covered with colour or any coating which masks the workmanship.

[Photograph—One Shilling and Threepence.]

CLASS 4.—CARVING IN IVORY.

(a.) *Human Figure in the round*.—One prize of £20 for the best, and a second prize of £10 for the next best, work executed after an ivory plaque of *Amorini*, by *Piamingo*, No. 1,059, in the South Kensington Museum; dimensions—five inches greatest length or after a relief in marble, the Virgin and Child, No. 4,233 in the South Kensington Museum. Dimensions—To be reduced in height by one-third (linear).

[Cast of the Plaque—Two Shillings; and Photograph of the Virgin and Child—One Shilling each.]

(b.) *Ornament*.—One prize of £7 10s. for the best, and a second prize of £5 for the next best, work executed after an ivory crosier head, in the South Kensington Museum, No. 814.'65. Dimensions—The same as the original.

[Cast—One Shilling.]

CLASS 5.—CHASING IN BRONZE.

(a.) *The Human Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a panel in low relief, the Virgin and Child, in South Kensington Museum, No. 66.'66.

A rough casting in bronze, on which the design is to be executed, will be supplied by the Society at the expense of the artist.

[Plaster Cast—Three Shillings and Sixpence.]

(b.) *Ornament*.—One prize of £10 for the best, and a second prize of £7 10s. for the next best, work executed after a silver gilt misal cover, in the South Kensington Museum, No. 2,889.

[Photograph—One Shilling.]

CLASS 6.—ETCHING AND ENGRAVING ON METAL—IN ANY WORK.

Prizes of the Goldsmiths' Company.

Ornament.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a bezel by Lucas Van Leyden, A.D. 1528. No. 13,364, in the South Kensington Museum. To be engraved after the photograph, and, if round a cup or goblet, raised so as to be not less than nine inches in length when stretched out.

[Photograph—Sixpence.]

CLASS 7.—ENAMEL PAINTING ON COPPER OR GLASS.

(a.) *The Human Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a panel in low relief, the Virgin and Child, in the South Kensington Museum, No. 66.'66. Ground to be blue. Dimensions—Half size of original.

[Photograph—One Shilling; Cast, Three Shillings and Sixpence.]

(b.) *Ornament*.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after the back of a plate, No. 8,428, in the South Kensington Museum. Ground to be blue. Dimensions—The same as the Photograph.

[Photograph—Sixpence.]

CLASS 8.—PAINTING ON PORCELAIN.

(a.) *The Human Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a photograph of a drawing by *Raphael*, No. 1,000, in the South Kensington Museum. Dimensions—The same as the Photograph. This work is to be coloured according to the taste of the painter.

[Photograph—Ninepence.]

(b.) *Ornament*.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after a photograph of ornament by *Aldreyer*, No. 2,118 in the South Kensington Museum, and coloured according to the taste of the painter, with a gold ground. Dimensions—Double the size of the Photograph (linear).

[Photograph—Sixpence.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 9.—DECORATIVE PAINTING.

(a.) *Ornament*.—One prize of £5, and a second prize of £3, for a work, executed after a photograph of ornament by *Aldreyer*, in the South Kensington Museum, No. 2,118. Dimensions—length, 3 feet.

[Photograph—One Shilling.]

(b.) *Ornament*.—One prize of £5, and a second prize of £3, for a work, executed after a *picture frame*, in the South Kensington Museum, No. 7,820. Dimensions—5 feet by 3 feet 11½ inches, outside measure. The works to be executed on canvases, either with or without stretchers, in cool colours. Some lines of the mouldings may be gilt.

[Photograph—One Shilling and Sixpence.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 10.—INLAYS IN WOOD (MARQUETRY, OR BUHL), IVORY OR METAL.

Ornament.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed after a guitar inlaid with ivory, ebony, and mother-o'-pearl. The ornament to be of the same dimensions as the original, but may be applied to any object. No. 9,611 in the South Kensington Museum.

[Photograph—Sixpence.]

CLASS 11.—CAMÉO CUTTING.

(a.) *Human Head*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a bust of *Clytie* in the British Museum.—The head only.

[Cast of the Head—Five Shillings.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 12.—ENGRAVING ON GLASS.

Ornament.—One prize of £10 for the best, and a second prize of £3 for the next best, work executed after arabesques by Lucas Van Leyden, A.D. 1528. No. 18,968 in the South Kensington Museum. To be engraved the height of the engraving; and if round a glass or goblet, repeated so as not to be less than 9 inches long when stretched out.

[Photograph—Sixpence.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 13.—WALL MOSAICS.

Human Head.—One prize of £10 for the best, and a second prize of £7 10s. for the next best, work executed after a *Female Head* (over the lame cripple) in the cartoon of the "Beautiful Gate." The dimensions of the work should be regulated by the size of the tesserae proposed to be used, which size may be left to the choice of the artist. Although desirable, it is not necessary to execute the whole subject in actual mosaic. The original is at the South Kensington Museum. Tesserae of two sizes may be obtained from Messrs. Minton, Stoke-upon-Trent;

Messrs. Maw and Co., Broseley, Shropshire; Messrs. Powell and Sons, Temple-street, Whitefriars; and Messrs. Jesse Rust and Co., Carlisle-street, Lambeth.

[Photograph—One Shilling.]

N.B.—A second set of prizes of the same amount is offered to female competitors. See conditions, Section VIII.

CLASS 14.—GEM ENGRAVING.

(a.) *Human Head*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a cameo portrait of Savonarola, No. 7,841 in the South Kensington Museum. Dimensions—The same as the cast.

[Cast—Sixpence.]

(b.) *Full-length Figure*.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a small Wedgwood medallion, No. 5,887 in the South Kensington Museum. Dimensions—The same as the cast.

[Cast—Sixpence.]

CLASS 15.—DIE SINKING.

Full-length Figure.—One prize of £10 for the best, and a second prize of £5 for the next best, work executed after a Wedgwood Medallion in the South Kensington Museum, No. 3,470. Dimensions—The same as the photograph.

[Cast—Sixpence; Photograph—Sixpence.]

CLASS 16.—GLASS BLOWING.

Ornament.—One prize of £7 10s. for the best, and a second prize of £5 for the next best, work executed after an original in the South Kensington Museum, No. 6,786. Dimensions—As given in the wood engraving.

[Photograph—Sixpence.]

CLASS 17.—BOOKBINDING.

(a.) *Bookbinding*.—One prize of £7 10s. for the best and a second prize of £5 for the next best, work executed in bookbinding, after a specimen in the South Kensington Museum, No. 164,64. The work to be bound should be some classical author of the size given. Dimensions—The same as the photograph.

[Photograph—One Shilling.]

CLASS 18.—EMBROIDERY.

Ornament.—One prize of £5 for the best, and a second prize of £3 for the next best, work executed, either after *Two Angels* in an example in the South Kensington Museum, No. 1194,64, or an Italian Silk in the South Kensington Museum, No. 7,468, which may be adapted to a screen. Dimensions—According to the taste of the embroiderer.

[Photograph—German, Sixpence; Italian, One Shilling.]

CLASS 19.—ILLUMINATIONS.

Ornament.—One prize of £5 for the best, and a second prize of £3 for the next best, copy made from an *Altar Card*, attributed to Giulio Clovio, in the South Kensington Museum, No. 2,868, or from a MS. border, date 1460, No. 3,057, in the South Kensington Museum. Dimensions—One-half larger than the Photograph (linear).

[Photograph—Two Shillings.]

SECOND DIVISION.

CLASS 20.—WOOD CARVING.

(a.) *Human figure in the round, in alto or in bas relief. Animals or natural foliage may be used as accessories.* 1st prize of £25 and the Society's Silver Medal, 2nd prize of £15. 3rd prize of £10.

(b.) *Animal or still-life. Fruit, flowers, or natural foliage may be used as accessories.* 1st prize of £10. 2nd prize of £7 10s. 3rd prize of £5.

(c.) *Natural foliage, fruit, or flowers, or conventional ornament, in which grotesque figures or animals may form accessories, preference being given where the work is of an applied character for ordinary decorative purposes, as representing commercial value.* 1st prize of £10. 2nd prize of £7 10s. 3rd prize of £5.

(By order)

P. LE NEVE FOSTER, *Secretary.*

Proceedings of Institutions.

HUDDERSFIELD MECHANICS' INSTITUTION.—The twenty-sixth annual report says that the results of the past year have been most encouraging. The classes have all been very well attended; and that the instruction given is valuable has been satisfactorily proved, for some of the old pupils are at work with the principal manufacturers and tradesmen of the town, not employed as mechanics and workmen, but in places of trust, which they have attained by their intelligence and good conduct. The number of members in 1866 was 1,256, against 1,089 in 1865. The receipts from the pupils were, in 1865, £321 7s. 8d.; in 1866, £341 12s. 1d. The annual subscriptions were, in 1865, £301 7s.; in 1866, £317 2s. The average weekly class attendance was, in 1865, 1,050; and, in 1866, 1,265. Upwards of 270 vols. have been added to the library during the year, which is now open every night except Monday, and contains 4,400 volumes. The issues in 1865 were 7,289, and in 1866, 8,660 volumes. The fortnightly meetings have done a great amount of good, and there is no reason to doubt the continuance of their popularity. They consist of singing and instrumental music; lectures of a useful and practical character; readings, serious or humorous, all gratuitously given. The penny bank continues to take a quiet and important part in the social advancement of the people of the locality. The number of depositors in 1865 was 14,770; in 1866, 15,637. The amount of deposits in 1865, £1,975 9s. 8½d.; and in 1866, £2,205 14s. 4½d. There are 107 classes, taught by 19 paid and 15 voluntary teachers. Many of those who take part in the instruction of the pupils are professional teachers of long standing. As a whole, the Committee consider that this is the most valuable department of the Institution. Besides the primary elements of instruction, reading, writing, and arithmetic, the pupils have the opportunity of learning the elements of geography, grammar, history, arithmetic, algebra, and bookkeeping. The most popular subjects are writing and arithmetic. For many years the absence of punctuality in the attendance of the boys has been a source of deep regret. In September, 1866, the Committee, in order to induce the boys to attend the classes regularly, determined to present prizes to all the junior pupils who should attend punctually seventy nights during six months, and have given satisfaction to the teachers during that period, and to those who attend eighty-five nights punctually a superior prize. The success of the scheme bids fair to exceed the highest expectations. Since its commencement, the weekly average attendance has been 1,619; while for the same time last year the weekly average attendance was 1,098. This greatly increased attendance has necessitated the fitting up of two additional class-rooms for the junior pupils. The Committee, mindful of the distances many of the pupils had to walk to reach the Institution, and the early hour at which all the operative class must be astir in the morning, determined on closing the class-rooms half an hour earlier—at nine o'clock, instead of at half-past nine. It is hoped that the change will lead to more concentrated work in the classes. The drawing classes are open every night. The course of

study is drawing and shading from copies, mechanical drawing, linear and practical geometry. A water-colour drawing class is held on Saturday afternoon, and is well attended. The chemical classes continue to be successful. At the examinations connected with the Department of Science and Art several prizes were taken by the students. The utility and importance of the loom class specially be fully appreciated. The room is nearly always filled with earnest students, anxious to acquire a practical knowledge suited to the trade of the district. The French keeping class is very popular, but the French class was not so numerously attended during the summer term. In order to make the class somewhat more attractive, French conversation class was commenced, and on every Wednesday evening, free of charge to all the pupils of the general class. In August last year a excursion to Wharfedale took place, when about 100 members and friends were present. The Secretary of the State for India has presented to the Institution the sets of eighteen volumes containing specimens of cotton, silk, and woollen textile fabrics of native manufacture. Only thirteen sets were distributed in Great Britain. The Committee have provided free access to it on the part of all persons practically interested in its inspection. The receipts have been £366 14s. and there is a balance in hand of £15 6s. 2d.

EXAMINATION PAPERS, 1867.

The following are the Examination papers at various subjects at the Final Examination held in April last:—

(Concluded from page 686.)

GEOMETRICAL DRAWING.

THREE HOURS ALLOWED.

I.

1. Construct a six-sided figure, A B C . . . A (O be a point within it) from the following conditions:—

Sides, &c.	Angles.
OA = 2 inches	AOB = 50°
OC = 1·65 "	BAO = 70°
CD = 1·8 "	BCO = 90°
OE = 1·8 "	COD = 60°
OF = 1·65 "	DOE = 90°
	EOF = AOF

2. On one side of a given line, A B, of 1·5 inches, construct an equilateral triangle, a pentagon, and a heptagon. On the other side of the same line construct a square, a hexagon, and octagon.

3. Describe a circle of 1·25 inches radius, and divide it into six equal circles, each touching the first and the two adjacent circles.

II.

Divide a line A B, 3·75 inches long, into segments with the following conditions:—

1. In a point C, so that $A B \cdot B C = 3$ square inches.
2. Either internally or externally in C, so that $A B \cdot B C = A C^2$ or $A C \cdot B C = A B^2$.
3. In two points C, D, so that $A C \cdot B D = A B \cdot C D$, A C being assumed at pleasure.

III.

Construct a triangle from the following conditions:—

1. The sum of the sides (perimeter) = 8 inches, and its angles, 40°, 60°, 80°.
2. Its sides in the ratio 2 : 2·5 : 3, and its area 5 square inches.
3. Its sides as 3 : 4 : 5, and the radius of the circumscribing circle 1·5 inches.

IV.

A triangle has its sides 3, 3·5, 4 inches.

1. Construct a square equal to this triangle in area.
2. Construct a rectangle equal to it in area, but the ratio of the sides as 2 : 3.
3. Bisect this triangle by a line parallel to the shortest side.

V.

rule of 1 inch radius and a line 2 inches from its being given—

Describe a circle of 1 inch radius to touch both.

Describe a circle to touch both, but the line in a 3 inches from the centre of the given circle.

Describe a circle to touch both, but to touch the circle in a point 2.25 inches from the line.

SOLID GEOMETRY.

VI.

square ABCD, of 2 inches side, is to be represented in and elevation from the following conditions:—

When three of its corners are 1, 1.5, 2.5 inches from the paper.

When its plane is inclined at 50° and the side AB inclined at 20° .

When its two diagonals are inclined at 20° and 35° . In each case the "ground line" of the elevation to be drawn parallel to the shortest side of the plan.)

VII.

prism four inches long, with a pentagon ABCDE of 1 inch side for its base, is to be represented by a plan and elevation from the following conditions:—

When its long edges are inclined at 55° to the paper and one side AB of its base is inclined at 20° .

When a line drawn from one corner A of one end to the opposite corner D of the other pentagon is either vertical or horizontal.

When the solid is suspended in the air by the corner A.

In the 1st and 2nd cases the "ground line" of the elevation to be taken parallel to the plan of that line the position of which is given in the question.)

VIII.

A pyramid of the same height, and with a similar base to that of the preceding prism, is to be represented in plan and elevation from the following conditions:—

1. When one long edge is either vertical or horizontal.

2. When the solid is suspended from one corner A of its base.

3. The top of the pyramid being cut off by a plane bisecting one long edge at right angles, the bottom frustum to be represented when resting on the section.

IX.

A cylinder and a cone, each four inches high, their bases being circles of one inch radius, and a sphere of one inch radius, are to be represented, by plan and elevation, in one of the following positions:—

1. The cone standing on its base, the cylinder lying on its side, and the sphere also resting on the paper, each solid touching the other two.

2. The cone lying on its slant side, the cylinder standing on its base, and touching the cone in a point halfway between the vertex and the base.

3. The cone lying on its slant side, the sphere also resting on the paper and touching the cone in any point at pleasure.

X.

1. A sphere of 1.25 inches radius has its centre three inches above the paper. Determine its shadow on the horizontal plane when the light is inclined at 60° .

2. The cone of the preceding questions, lying on its side on the paper; determine a plane tangential to its surface, but inclined at 60° .

3. The axis of the cylinder being inclined at 35° , determine by its plan and elevation a line inclined to the paper at 60° , and touching the surface in one point.

N.B.—To entitle the candidate to a first-class certificate, he must construct two at least of the questions of the Solid Geometry.

THEORY OF MUSIC.

THREE HOURS ALLOWED.

RUDIMENTS OF MUSICAL GRAMMAR.

(Nos. 5, 6, 7, and 8 must be answered on music paper.)

1. In what scales is the following?

2. In what major scale only is the following? and why?

3. Explain the following words—syncopation, inversion, transposition.

4. What is meant by a chromatic scale?

5. Add a major second to a, a major third to b, a perfect fourth to c, and an imperfect fifth to d.

6. Write the scale of Sol (G) minor in every form with which you are acquainted.

7. Put time signatures to the following:—

8. Give an example of an augmented second, of a diminished third, a diminished fourth, an augmented fifth, an augmented sixth, and a diminished seventh.

HARMONY, COUNTERPOINT, AND MUSICAL HISTORY.

(Nos. 6, 7, and 8 must be answered on music paper.)

1. What objection is there to the use of the 7th of a major scale as a root, and under what circumstances can it be so used?

2. Give a reason, founded on the laws of harmony, for the elevation, by a semitone, of the 7th of a minor scale.

3. What objection is there to the following progression, and what are the difficulties attending the arrangement of the accompanying parts?

4. Point out the errors or imperfections in the following:—

5. What are the roots of the following?

6. Add three parts to the following:—

7. Add a part, or parts, in any kind of counterpoint, to the following:—

8. Harmonize the following:—

9. Who were the principal English composers of the reign of Charles II.? State anything that you know about them.

PARIS EXHIBITION.

Now that the last month of the exhibition is begun, and doubtless many visitors will cross the channel, it will be well to give, not a complete account, for that would be impossible, but a sketch of some of the most salient points in the foreign sections. The group of applied art, or, to quote the terms of the classification, of "the material and applications of the liberal arts," presents perhaps the most interest for the readers of the *Journal*. France makes a magnificent show in this group; the two exhibits which preface it in the grand vestibule are both essentially typical of her progress in the most important of all the divisions of the group. One consists of a collection of the works issued by the great publishing firm of Hachette and Co., the other of the printed productions of Messrs. Maune et Fils, of Tours. The former firm issues the largest number of works of any house in France; the latter, perhaps the finest specimens of printing, and especially of large books and illustrated works. The beauty of the typography alone demands great attention, while the richness of illustration shows the great progress that has been made in this respect. In one case as in the other the prolific genius of Gustave Doré is everywhere apparent; but he is not alone, and the style of illustration generally exhibits a notable advance since 1855. Behind these two collections are two grand compartments, which, together with the avenue between them, are filled with a mass of prints, chromo-lithographs, and illustrated books, most of them of admirable execution; the number of illustrated works of science, technical as well as popular, is surprising. The collections of stationery, and of artists' materials and office requisites, are very large, and show as much progress as the typographical department.

One of the most remarkable collections, however, is that of designs, sketches, and models for manufactures. Here our neighbours exhibit an amount of ingenuity which is unrivalled; and if the taste is not always severe, at any rate it is almost universally agreeable. In the designs we find a large number of copies of Chinese and Japanese work, but, generally, they are adaptations, and not mere copies, and exhibit a remarkable amount of artistic ingenuity. Amongst the designs and models are many finished works; and a collection of decorated faïences by Messrs. Collinot deserves special notice; it consists of a pavilion formed entirely of ornamental glazed pottery, paved with encaustic tiles, and filled with fine pieces of decorated ware, large and small, and admirable in body, glaze, and colour. The scientific section which adjoins the preceding is scarcely less im-

portant, with this exception, that it contains contributions which were exhibited in 1854, and are therefore really out of date here; but the class of scientific and philosophical instruments from Ruhmkorff, and of microscopic preparations and anatomical models, is magnificent. The collection of instruments opposite the two salles above-mentioned of surgical instruments and medical and anatomical apparatus beyond, are both of them unequalled in extent or importance. The last department of the group is occupied by the materials of education; an admirable show, but, unlike the others, crowded and dimly lighted.

The other states follow in order around the side of the building, and all, or nearly all, show valuable collections, musical instruments, photographic stationery. Hesse, Baden, Wurtemberg, and others are remarkable for their collections of drawing and mechanical models.

Austria makes a good show in nearly all the divisions of this group, but especially for geological maps, books, charts, and collections for general and technical education.

Greece emulates England, and exhibits among her newspapers and periodical journals, amounting to just 100 in number.

Russia here, as elsewhere, takes a highly honourable place; she has a fine collection of photographs representing public buildings, and a most interesting series of views in the Caucasian mountains; a very remarkable series of figures of peasants and others, and animals in terra cotta; a good collection of surgical instruments; and also of stationery, plain and decorated.

Italy exhibits in this group one of the most important inventions in the Exhibition, that of M. Brunet, for preserving animal tissues, to which a grand prize has been awarded; healthy and diseased lungs, and parts of the body are exhibited in a dried form, and a little shrivelled, with the appearance of paper, parchment, and of a consistency permitting it to be used in any manner with ease, and even cut into the thin laminae for microscopic examination or exhibition. Italy has also a good show of educational books, models, collections of photographs, including enamelled specimens.

In the United States section are several pieces of excellent quality, and cabinet organs; books, maps, and photographs. South America, India, Canada, and other British colonies, all exhibit photographs; and being views of local scenery, are highly interesting.

Great Britain completes the group with the best collection of periodical and other printed works in the Exhibition, not perhaps in an artistic, but in a moral, and commercial point of view; if some fine specimens of typography can be shown by other countries, no state could exhibit such a mass of beautiful, sound, well-printed literature, produced within the short period of twelve months. The English portion of the group includes admirable examples of the application of art to the decoration of ceramic and metal work, although we cannot claim to be first in ornamental art; we may well congratulate ourselves on the progress which we have made since the great display in 1854, taught us our deficiencies.

THE LAMBETH LIBRARY.

The following letters have been addressed to the editor of *The Times*:—

SIR,—A short time ago you suggested that the Lambeth library, abandoned by the Archbishop of Canterbury and starved by the Ecclesiastical Commissioners, should be transferred to the British Museum, and your suggestion has been generally echoed by the press. But before it is adopted allow me to make another one, which I think that the library be made a public one for that part of the metropolis.

Paris has its four public libraries supported by the State, besides the Bibliothèque Impériale. Then there is the library of the Hotel de Ville, with its 70,000 volumes of the histories of French towns; the Arsenal library, with its 6,000 MS. and 200,000 volumes of early poets and Italian literature; the library of the Conservatoire des Arts et Metiers, with its 20,000 volumes on science and art; the St. Geneviève library, with its 180,000 volumes of divinity, classics, &c. In all, there are upwards of 18 public libraries in Paris, all accessible to every student, whereas London, with its greater extent and population, has only the British Museum and the Educational Library at South Kensington to which the public has a right of access.

Let us have a public library at Lambeth based upon the existing one, the oldest public library, it is said, in England, hallowed with innumerable associations. There are already on the spot the books and manuscripts; the Ecclesiastical Commissioners offer £150 a year, which could, perhaps, be augmented; Parliament, which would have to pay something for the transfer to the British Museum, might make its annual contribution; and Lambeth itself, through the Public Libraries Act, might raise a rate of a half-penny in the pound, like Manchester, Birmingham, &c., and thus would be provided a sufficient sum for management and increase, and a great public good effected.

There is Nixon's noble dining-room waiting for a reading-room, and there are the gardens for a public promenade when the Archbishop is out of town. If we allow the books to be sent away, the old historical buildings and their associations will soon be swept away and the ground leased on building leases for 99 years. It would be a sacrilegious act, which I believe even household suffrage is too conservative to permit, but if allowed would lead, I believe, to abolishing the Archbishop of Canterbury himself.—I am, &c.,

HENRY COLE.

Paris, September 24.

SIR,—Every one who is acquainted with the constitution and peculiar character of the Lambeth Library, or has seen the two catalogues of the more interesting portions of it, printed by that profound scholar and excellent man, Dr. Maitland, who was for so many years the keeper of that library and the friend of Archbishop Howley, must agree with Mr. Cole in deprecating its removal to the British Museum, and in advocating its preservation as a separate library.

There is a homely English proverb, full of practical wisdom, which bids us "Not to put all our eggs in the same basket." It is one which we should do well to bear in mind on the present occasion.

Inflammatory as may be the subject of many books, books themselves, fortunately, do not readily consume. Yet who can contemplate without a shudder the possibility of a fire breaking out in our great National Library; and who would not, in the face of so great a calamity, which Heaven forefend, rejoice that the Lambeth Library had not added to such a holocaust?

But, agreeing with Mr. Cole that the library should not be removed, I cannot agree with him in intrusting it to the halfpenny rate-payers of Lambeth, and so, perchance, making its maintenance the subject of a party vote, and its dispersion the consequence of some ultra-radical majority.

Did the parish of St. Martin come forward with a halfpenny rate to save Archbishop Tenison's Library? Does my memory mislead me, or am I right in believing that in one of the north-western parishes of the metropolis a library which had been collected by a rate, by subscriptions, by contributions from learned societies and men of letters, and by the liberality of some of our great publishers, was eventually sold, because a rate for its maintenance could not be carried?

Lambeth Library ought to be preserved, not only as an additional library in the metropolis, but as a monu-

ment of the liberality of the prelates by whom it was founded, and of the learning of the Whartons and Maitlands to whose custody it has been intrusted; and it ought to be maintained by a Parliamentary grant. A thousand a year would cover—I believe, more than cover—all the necessary expenses, including the binding and repair of the books and the salary of the librarian. The librarianship would be a literary Blue Riband for one of those ripe and good scholars of which our Church can boast so many, the recent holder of that office being, of course, its first recipient.

What Chancellor of the Exchequer would hesitate to propose, what House of Commons, reformed or unreformed, would hesitate to vote, that sum for the maintenance in the beautiful hall, which the munificence of Dr. Howley fitted up for its reception, of a library as unique in its character as it is rich in its contents?

I am, &c.,

WILLIAM J. THOMS.

SIR,—Mr. Thoms's concurrence in my suggestion to preserve Lambeth Library on its present site is satisfactory as coming from such a scholar and archæologist. But in ascribing to me a notion of intrusting it to all the accidents of parochial management he has misunderstood my letter. If the Ecclesiastical Commissioners and Parliament respectively contributed portions of the funds, I think it may be assumed that some proper public responsibility would be established for the administration of them. The parish of Lambeth might come in aid with funds to provide for additions, and to secure the general throwing open of the library and its use by the parishioners. If Lambeth be not advanced enough to do this, *cadit questio*, so far as it is concerned. The public moral obligation of preserving and utilising this, the oldest library in London, remains just the same on the Ecclesiastical Commissioners, on the Archbishop of Canterbury, and, I hope it will be admitted, on Parliament. I venture to hope that the present Archbishop will, in respect of this venerable institution, prove himself to be a worthy successor of Archbishop Juxon.

I am, &c.,

HENRY COLE.

Oct. 1, 1867.

BRITISH ASSOCIATION, 1867.

THE IRON SHIPBUILDING OF DUNDEE.

MR. HENRY GOURLAY read the following paper on this subject:—

Shipbuilding has long been an important branch of industry in Dundee, and even at the beginning of the present century the number of vessels built for coasting and over-sea trade was considerable. All these vessels were, of course, built of timber, and about the year 1823 were all propelled by sails. The number and size of the vessels gradually increased, until about the year 1856, when wooden shipbuilding in Dundee may be said to have reached its maximum. In that year Messrs. Alexander Stephen and Son built the *Eastern Monarch*. This vessel measured 1,848 tons, n.m., was classed 14 years A1 in Lloyds' Register, and at the time was one of the largest, if not the largest, vessel afloat of this high class. At this time there were six firms which built timber vessels, whereas at present there are only two which do so exclusively, one other firm building timber and composite vessels. There is also a considerable number of wooden vessels built on the Tay at Perth, Newburgh, and Tayport. It is now nearly thirty years since iron shipbuilding was introduced in Dundee. In the year 1838 Messrs. James Carmichael and Co. built an iron paddle steamer (for, as we shall immediately see, steam shipbuilding had been commenced some time prior to this). This vessel was named the *Caledonia*, and was intended for the river traffic between Dundee and Perth. The same firm also built a small iron schooner. These

vessels attracted considerable attention at the time, there being very few iron vessels then afloat. After building these two vessels, Messrs. Carmichael discontinued iron shipbuilding, but it was again taken up in 1840 by Mr. Peter Borrie, who built several iron paddle steamers. Unfortunately, Mr. Borrie was not commercially successful, and so was compelled to abandon the trade. Between the years 1842 and 1854, no iron ships were built in Dundee, and during this interval other ports had commenced, and were carrying on the trade with vigour, so that, although Dundee was early in the field, this advantage was lost.

In 1854, Messrs. Gourlay, Brothers, and Co., commenced to build vessels of iron, and since that time the trade has steadily increased, there being now two firms which build entirely with iron, and one which uses iron for the frame-work. The largest iron vessel yet built in Dundee is named the *Dundee*, and measures 1,295 tons register. It was built by Messrs. Gourlay, Brothers, and Co., is owned by Messrs. Gilroy, Brothers, and Co., of this town, and is employed to carry jute from Calcutta.

As a proof of the severe treatment which iron vessels are capable of sustaining, without permanent injury, the following facts may be here mentioned:—On the 18th November, 1865, the screw steamer *London* was proceeding down the river Tay when she was run into and cut down to the bilge by the steamer *Harvest Queen*. The opening made in the *London's* side was about twelve feet long at the gunwale, and tapered gradually down to the bilge—the gunwale and 'tween deck stringers being entirely carried away. In about a quarter of an hour the vessel sank in deep water, where only a small portion of her deck forward was dry at low water in spring-tides. In this position she remained for twelve months, during which time she endured the violence of several severe storms. The gap in the *London's* side was about fifty feet from the stern, and nearly the whole of this length was unsupported—the vessel resting amidships on a hard bottom, so that she lay for twelve months exposed to the fury of the sea, with nearly fifty feet of her stern overhanging, and this with only one side of the vessel left entire. The *London* was raised last December by her builders, and is now in as seaworthy a condition as the day she was launched. The *Harvest Queen* struck the *London* with her stern, and was consequently not so much injured; but she had to be run ashore on bad ground, and, being heavily laden with coal, she parted amidships when the tide left her; however, she was raised by Mr. Petrie, of Newport, and is now also as seaworthy as ever.

Steam shipbuilding has also been long carried on in Dundee. We find that in 1823 there was a paddle vessel, named the *Hero*, built for the passenger traffic between Dundee and Perth; and in 1834 Mr. Thomas Adamson, in conjunction with Mr. Peter Borrie, energetically took up this branch of the trade, and built a number of paddle steamers, one of which was the unfortunate *Forfarshire*, that was lost on the Fern Islands, and to save whose passengers Grace Darling made her heroic efforts. All these steamers were built of timber; but in the year 1840 Mr. Borrie, as has been already mentioned, commenced to construct iron steamers. The first screw steamer built in Dundee was launched from the building-yard of Mr. John Brown, in 1851. This vessel, named the *Correo*, measured 395 tons s.m., and was fitted with a pair of geared engines of 70-horse power. After Mr. Borrie gave up business, steam shipbuilding was not carried on to any great extent until the year 1854, when it was again revived by Messrs. Gourlay, Brothers, who have carried it on since that time, and have turned out a large number of steamers, many of which have been vessels of considerable value, fitted for carrying mails and passengers, and such have been supplied to several of the leading steamship companies.

About ten years ago, a sailing vessel named the *Tay* was fitted with a pair of screw engines, and sent to the

whale fishing—her owners thinking that the steam would be a great advantage. This step proved to be correct, and the following year the two screw whalers built specially for the trade at that time a great number of such vessels had turned out by Messrs. Alexander Stephen and Son for this and other ports. The employment of iron vessels for the seal and whale fishing has now been entirely abandoned in Dundee. These vessels have all been built of timber, and are strengthened to enable them to endure the severe pressure to which they are often exposed; they are only fitted with auxiliary power, and are fully rigged for sail. A difference of opinion prevails as to whether iron is a suitable material for building vessels intended for the trade. It is urged, on the one hand, that iron vessels have been already tried, and found to be unsuitable amongst ice; that iron is untrustworthy when exposed to low temperatures, especially when it has to bear the impact of masses of ice. On the other hand, it is asserted that the iron vessels which were sent to the fishery some years ago were not built for the trade, were quite unsuitable for it; that a good quality of iron is little affected by low temperatures; and that, by adding slightly to the thickness of the plating, the strength of the vessel to resist the impact of ice is greatly increased; and that, as whaling vessels are supplied with large tanks to contain the cargo of oil, such tanks may be fitted to form independent compartments, so that if a piece of the ice should penetrate the skin, the result will merely be that one of the tanks will be filled with water.

Until the year 1865 all the vessels built in Dundee had been constructed either of wood or iron, but at that time Messrs. Stephen commenced to build ships of a combination of these materials. Such vessels are known as composite, and, as built by Messrs. Stephen, are classed 15 years A 1 in Lloyd's register. The frames, main stringers, tie-plates, and beams are of iron, and the planking, keel, stem and stern post, are of timber. The planking is secured to the frames with yellow metal bolts, and is also sheathed with yellow metal, the same as wooden vessels, so that such vessels do not fear iron ones are apt to do, on long voyages. Shipbuilding in all its branches is at present in a rather depressed condition in Dundee, as indeed it is all over the world, but this state of things is only temporary, and the trade will no doubt soon revive.

In order to give a correct idea of the shipbuilding carried on in Dundee, I will show what tonnage has been built during the last six years by the five firms now engaged in it, and shortly describe what each firm has done. Messrs. Alex. Stephen and Son build composite and wooden vessels; the composite ships are generally of considerable tonnage, varying from 600 to 1,644 tons s.m.; the wooden vessels built by this firm have of late years been nearly confined to screw whalers. Messrs. Stephen, since January, 1861, have launched 4,277 tons of wooden sailing vessels; 5,621 tons of screw whalers fitted with 600 horse-power; 1,847 tons of composite sailing ships; and have on the stocks one screw whaler of 520 tons, and one composite sailing ship of 601 tons s.m.—in all, 11,861 tons s.m., and 600 horse-power. The average number of hands employed by this firm is about 220. Messrs. Brown and Simpson are now principally engaged in building iron vessels. Before 1865 Mr. Brown built wooden vessels, and altogether there have been launched since 1861, 2,551 tons of wooden sailing ships; 2,491 tons of iron sailing ships; and 63 tons of iron steamers; and there is on hand 1,066 tons of iron sailing vessels—in all, 6,108 tons. The number of men employed is about 200. The Tay Shipbuilding Company build wooden vessels, and since 1861 have launched 4,502 of such, and have on the stocks one vessel of 395 tons—in all, 4,852 tons. The number of men employed is about one hundred and twenty. The Dundee Shipbuilding Company also build wooden vessels. They

have launched 3,348 tons since 1861, and have one vessel of 398 tons on hand; build vessels up to 610 tons. The average number of men employed is about seventy. Messrs. Gourlay, Brothers, and Co. build iron vessels. They have been principally engaged in building steamers, and since January, 1861, have launched 2,511 tons of sailing vessels; 11,293 tons of iron steamers, fitted with 2,480 horse-power; and have on hand two steamers measuring 1,130 tons collectively—total tonnage, 14,934 tons. The average number of men employed in the building yard is about 300. The following table will show the tonnage of the various kinds of vessels that have been launched in Dundee since the year 1861, and also the tonnage on the stocks in June of this year:—

Wooden sailing vessels launched since 1861	13,673	
On the stocks, June, 1867.....	748	
		14,421
Wooden steamers launched since 1861	5,621	
On the stocks, June, 1867.....	520	
		6,141
Total tonnage of wooden vessels		20,562
Iron sailing vessels launched since 1861	5,002	
On the stocks, June, 1867.....	1,066	
		6,068
Iron steamers launched since 1861	11,356	
On the stocks, June, 1867.....	1,130	
		12,486
Total tonnage of iron vessels ..		18,554
Composite sailing vessels launched since 1861	1,847	
On the stocks, June, 1867.....	601	
		2,448
Total tonnage of composite vessels		2,448
Total tons		41,564

The value of the vessels represented by this tonnage is about \$627,000 sterling, or £104,500 annually, exclusive of the machinery fitted on board the steamers. The average number of men and boys employed in the ship-building yards is about 910. The materials of which the vessels are constructed are generally brought from a distance. The iron comes from the north of England and Glasgow; the wood—except the oak, which is grown in the neighbourhood—from the Baltic, America, and India. The chains and anchors are generally manufactured in Newcastle, but the sailcloth and cordage are produced in Dundee. The cost of the carriage of iron and coal is a disadvantage that the Dundee shipbuilder labours under; but it is not a very serious obstacle, as these materials can be carried at a cheaper rate by water, and there are advantages to compensate, so that there is no reason why shipbuilding may not be largely carried on in Dundee. Iron as a material for shipbuilding is here, as elsewhere, to a large extent taking the place of wood, for I find that in 1853 there were no iron ships building in Dundee, but for the last six years the tonnage of the iron vessels has not been far short of the wooden ones, whilst there is nearly double the tonnage of iron vessels on hand than there is of wooden ones.

TECHNICAL EDUCATION.—HOROLOGICAL SCHOOLS IN FRANCE.

A few years ago the watch and clock trade in France had fallen to a low ebb; the home production was small, and the importation considerable; great efforts have, however, been made at Besançon, and all along the Swiss frontier, in the arrondissements of Moreau and Pontarlier, the district of Montbéliard, and the mountains of the Doubs. Large factories in the two latter districts are employed in the making of detached pieces of the

mechanism only. The number of watches produced at Besançon is about 300,000 a year, gold and silver; this is equal to about four-fifths of the whole consumption of France. The Besançon trade has increased very rapidly; in 1845 the total make was just over 54,000; in 1855 it had risen to 142,000; and in 1865 it was just under 300,000. The effect of this increased activity is shown in the imports, which have declined in the same proportion as the home manufacture has increased; in 1855 the number of watches received from abroad was 200,000, but in 1865 it had fallen to 45,454. There exists at Besançon a school of horology, towards the expenses of which the municipal authorities subscribe £800 a year. Another school was established in the year 1863-4 at Cluses, in the arrondissement of Bonneville, on the road from Geneva to Chamounix. The object of this school, as stated in the Imperial decree, is to form educated and able workmen for the different branches of the trade, and to secure the necessary instruction for those who intend to become manufacturers, finishers, or repairers. The course of instruction must not exceed three years, and the teaching, which is theoretical as well as practical, is gratuitous. The theoretical instruction includes French grammar, writing, mechanical drawing, arithmetic, geometry, and the elements of algebra, physics, and cosmography. The practical instruction is given in four workshops, devoted severally to the making of the various parts, in the rough-cutting pinions, making dials and finishing the various kinds of escape-ments, putting together, casing and regulating, and, lastly, accessory operations, such as wheel-cutting, jewelling, and case making and finishing.

The lads are boarded out of doors, but under the surveillance of the school, and the cost, including board, lodging, and washing, is £21 per annum, paid quarterly in advance. A portion of the pupils are maintained by the state and by the local authorities, the rest by their own families. Each pupil has to deposit the sum of one pound to defray any loss of materials which may occur by his own fault.

The director, with the advice of a council, gives a certificate to each pupil who deserves one, indicating the degree of his proficiency, and stating the special operations to which he has devoted himself while in the school.

Boys are not admitted until they have passed the age of fourteen, but no maximum seems to be fixed in this respect. Each pupil is required to be able to read, write, and cypher, and know something of the metrical system of weights and measures, before admission; and all candidates are examined by a schoolmaster appointed by the sub-prefect of the place to which he belongs; the list of those who have passed their examination is placed in the hands of the prefect, who nominates those who are to enter the school.

In the school the pupils wear a grey linen blouse, and out of doors either that or a blue tunic, like the pupils of the Paris schools, with a uniform *kepi*. Each pupil has to find his own books and tools; the list of the latter, however, is not long—a turning tool, pair of pliers, compasses, calipers, hammer, oilstone, blow-pipe, two gravers, half-a-dozen files, and two whalebone bows, with a dozen gut strings. A collection of finished watches, movements, and detached pieces produced at the school may be seen at the Paris Exhibition.

Manufactures.

IMPROVEMENTS IN RAILWAY CARRIAGES.—The French railway companies are making considerable improvements in their carriages. The Paris, Lyons, and Mediterranean line has just put to work a very large number of first-class carriages, six hundred it is said, of an improved model; these carriages are larger and more comfortable than usual, and the company has very considerably had the arms which divide the places made

so that they may be easily removed, and thus allow passengers to lie at full length upon the seats when the carriages are not too full. The Eastern line has done what was still more desirable—namely, started a number of third-class carriages on an improved model; they are much better ventilated than the old ones, and the seats are divided by arms; unfortunately, however, as these arms are fixed, the third-class passengers of the Eastern Company will now be deprived of the chance of the recumbent stretch which they had before. A shed in the French quarter of the grounds of the Paris Exhibition contains an admirable collection, not only of railway carriages, but all kinds of fittings and materials for the same, and well deserves a visit.

PAPER MANUFACTURE IN RUSSIA.—This industry is being very rapidly developed in Russia. In 1845 there were only 168 paper mills, producing paper to the value of £450,000. In 1864 there were 184 mills, with 13,000 workmen, and their production was returned at the value of £900,000. There are paper manufactories in all the governments of the empire except Archangel, Astrakan, Vitepsk, Grodno, Kovno, Minak, Voronege, Sezaroff, Poltawa, Kherson, Yethakerinoalan, Bessarabia, and the Tauride. The government of St. Petersburg stands at the head of the manufacture, having 80 mills and 2,200 workmen, producing one-third of the whole quantity made in the empire. Moscow comes next with 94 mills; Skalonga and Viatka next with 15 and 11 respectively.

MANUFACTURES IN NORWAY.—The spinning mills and manufactories of woven goods employ about 2,500 workmen. Sixteen mills prepare about 2,000,000 kilogrammes of cotton yarn, and there are 11 manufactories of cottons, 3 of sail-cloths, and 3 of woollen cloths; the last work up 440,000 lbs. of wool annually. There are in Norway 44 rope yards, employing 360 workmen; 78 tobacco manufactories, employing 800 workmen, and exporting 5,300 lbs. of manufactured tobacco; 8 establishments for making matches; 328 tile-making works, employing 2,080 workmen, and producing annually 40,000,000 tiles and bricks; 26 machine works, occupying 1,250 workmen; 3 large and 4 small paper mills, with 200 workmen, producing about 550,000 lbs. of paper of all kinds; 8 manufactories of pianos, which turn out 150 instruments a year; 6 glass-works, employing about 300 workmen; and 6 establishments for wood distillation; about 7½ millions of litres of spirits are made, employing 890 workmen; 96 breweries, with 616 workmen, furnish for export annually 100 hectolitres of beer, sent specially to Sweden, Denmark, and Hamburg; 5 million kilogrammes of barley are yearly made into malt. The tanneries produce 2,600,000 lbs. of leather.

Commerce.

TRADE OF THE SANDWICH ISLANDS.—Among the articles exported from these islands in 1866 were:—Sugar, from the port of Honolulu, 17,729,161 lbs.; molasses, 861,795 gallons; flour, rice, 438,367 lbs.; coffee, 98,682 lbs., against 263,705 lbs. in 1865; salt, 738 tons; cotton, 22,289 lbs.; goat skins, 76,115 bales, against 144,085 bales in 1865; leather, 282,305 lbs.; tallow, 159,731 lbs.; whale oil, 91,182 gallons; whalebone, 56,840 lbs. Other articles, such as silk, mats, wood for cabinet work, &c., also furnish articles of exportation. Among other articles of commerce, the silky fibres of a fern, under the name of "pulu," are shipped to California to the amount of 212,026 lbs. The line of steamers between China and San Francisco touches at Honolulu, and Hawaiian vessels carry on a regular service with Bremen.

AGRICULTURAL PROSPECTS IN ITALY.—The vintage in Southern Italy is by this time about finished, and was begun at least ten days earlier than usual, in consequence of the extreme dryness of the season, which has burnt the grapes in many places. In Sicily and the Neapolitan

provinces the new wine is not only abundant but contains an unusual amount of spirit. In Tuscany the grapes are not quite so plentiful as in the south, but on the other hand they are not so much scorched. In Piedmont and the provinces of the Emilia the vintage is most satisfactory; the rice also promises to yield a most abundant harvest. The cotton crops are not very promising, excepting those where there is a plentiful supply and a good system of irrigation. Cattle are scarce, partly owing to the scarcity of grain from want of irrigation, and partly to exportation, which has almost occasioned uneasiness in Northern Italy; on the other hand, the epizootia has destroyed a good many in Sicily and in the Neapolitan provinces. An abundant crop of olive is expected. In general the harvest has been good, as is proved by the prices of cereals.

Colonies.

NATAL COAL AND IRON.—The *Natal Mercury* makes the following observations:—"It is to be hoped that the colonists will not allow the question of coal-development to sleep. Coal and iron are, notoriously, the most certain staple of a country's prosperity. They have carved out position of commercial pre-eminence for Great Britain, and so completely do the advanced statesmen of the day recognise them as the primary sources of her national greatness, that her decadence is pre-dated from the time when her coal measures become exhausted. The possession of these motive powers of industry makes America independent of the world. Coal supplies the heat by which iron can be manipulated into countless forms of utility and ornament. Energetically turned to account, they can hardly fail to secure wealth and prosperity. To men whose lives have been spent in the manufacturing districts of England, and who have day by day seen around them the wonders wrought, not only industrially, but socially, by means of coal and iron, the apparent apathy existing here, in regard to these resources, is incomprehensible. Here, say they, we have within your grasp the sources of wealth; here is abundant scope for the employment of industry, and yet you repine about your poverty, and cry out for work. To such persons no effort would be too great to measure too bold—in order to turn these elements to valuable account. They deride the prudent objections of those who urge the rashness, if not the folly, of incurring heavy liabilities in the shape of capital borrowed to work the enterprise. If coal and iron abound, as they are said to do, the speculation is simply the soundest form of investment. You have a vast market for your supplies. India, Mauritius, and Aden, would find in your port the nearest source of supply. Nor is this all. Were coal obtainable at cheap rates here, a change would be created in maritime commerce. Large steamers would be constructed to round the Cape, and to coal here, and the costly and troublesome overland route would be partially abandoned in favour of the old course of trade. Steamships, moreover, are coming into fashion even for long sea routes in preference to sailing ships, as carriers of cargo. Two or three lines now ply to China, and call at Mauritius; sometimes at Algoa Bay. Were coal obtainable here, this would be their port of call; while steam traffic would soon engross a large part of the vast East Indian trade. As to a market, therefore, the future is certain. This is the substance of the arguments lately set forth by Mr. Donovan, Dr. Mann, and others, in the columns of English journals, with reference to our coal fields. There is much irresistible truth in them. We are neglecting the right use of the natural agencies conferred upon us by Providence, for the attainment of our true position as a community. While we deplore the misfortunes that beset us, and spend hope after hope in quest of better times, might we not with advantage consider whether by organisation, investigation, or any

other kind of effort, it may not be possible to second the endeavours of people in England, and supply them, at any rate, with better materials of action than what they have now. Government might do its part in obtaining a practical and precise report upon the Newcastle coal measures. But a more immediate line of effectual action lies open to private and interested persons. Why should not the holders of land in those parts, and, indeed, all colonists who would be directly or indirectly benefited by the results of action—who would not?—combine and subscribe, so as to obtain a large shipment, not less than 100 tons, or, better still, an entire cargo, and send it home as proof positive that the coal is there. The expense would be considerable—perhaps £1,000, but the sale of the coal would partly reimburse the subscribers, while the good done to the colony and to individual interests would be incalculable. Would it not be wise policy on the part of institutions largely interested in landed securities, to liberally aid, if not to initiate, such a movement. Such a shipment as we have indicated would alone enable us to ascertain the market value of our coal deposits, and to arrive at a positive understanding of the quality and kind of the coal." As to the question of iron, the same writer says:—"Native usage and tradition in Africa all point to the feasibility of iron-working being largely carried on here. In Australia the aborigines use spears armed with fish bones. Here, and throughout the continent, spears and other implements made of iron have from time immemorial been in use among the natives. From those savages we may learn wisdom in this matter. Dr. Livingstone says that in Zambesi the tribes can supply themselves with iron more easily than it can be imported. He says "the natives consider English iron rotten, and will not use it. I brought home some of the hoes which Sekeleth gave me to purchase a canoe, and some others obtained in Quillimane, and they had been found of such good quality that a friend of mine in Birmingham has made an Enfield rifle of them." On sending a specimen of this iron to a blacksmith, "he pronounced it strongly like Swedish or Russian, and added that when chilled it had the properties of steel." An equally valuable and high-classed metal is obtained among the Fans on the West Coast, from iron-stone smelted in the rudest manner by wood fuel heaped on to bits of ore, and kept burning for several days. Du Chailu says that this iron is so tenacious that the natives prefer it to any from Birmingham or America, and by its own excellence it "protects" itself. Indeed, as a rule, we believe that locally manufactured iron would be likely to be more durable than imported, which is too often made bad expressly "for exportation," on the principle that anything will do for the colonies. But whether this be so or not, the folly of neglecting these twin sources of wealth, lying as they do under our feet, cannot be over-estimated. Coal and iron will make Natal, and confer upon us prosperity far faster and more effectually—with a more quietly formed solidity, and with less immediate demoralisation—than would all the gold mines of Goldera. In discussing the expediency of forming a railway, let us then bear in mind that such a line would give instant activity to those wonderful but latent resources. What we lack in population is made up by the wide-spread existence of these two levers of progress. For not in Natal merely, but beyond our borders, along the eastern slopes of the northern Drakensberg, and throughout the Transvaal Republic iron almost everywhere, coal frequently, are known to be laid up—as if by Providential design—for the use and enrichment of our enterprising people. It seems as if the destiny marked out for South Africa is, when the times are ripe, and the necessity has matured, to become the iron-foundry and fuel-market of the southern world. Shall we, in the hour of need, grasp this distinction or let it slip?"

PRECIOUS STONES AT THE CAPE OF GOOD HOPE.—A Cape paper states that people are prospecting in all directions in the neighbourhood of Colesberg in search of diamonds. A number of those precious stones have already been found, some of them of considerable value. The first diamond was picked up by a little girl at Hoptown. Her father is a labourer, on the farm of Mr. Schalk van Niekirk. She took the diamond to her mother, and the latter, thinking it only a pretty stone, returned it to the child to play with. Niekirk happened to see it glitter and offered to buy it of the girl, but she gave it to him, saying, laughingly, who ever heard of selling a stone. He took it, and it proved to be a diamond worth £500. Garnets have just been found in considerable numbers at the Cape. The copper miners in Amapondaland are meeting with much encouragement. Oil stones have just been found in the Gamubie river. Amber has also been found in the Colesberg district, also formations containing phosphorus and quicksilver. It is also reported on good authority that some gentlemen in seeking for diamonds have come upon a lode of silver and lead ore.

COPPER IN NATAL.—An important mineralogical discovery has recently been made in this colony. It may be remembered that the mines at Griqualand owed their discovery to the rude green paint used by the natives in decorating their faces. The attention of Mr. Shepstone, Secretary for Native Affairs, was attracted by this circumstance to a similar incident, noticed by him 18 years ago within the boundaries of Natal. In course of time he succeeded in identifying the exact locality, and Mr. Warne, a practical miner of 30 years' experience, has recently returned from a nine days' prospecting trip, bringing with him about three cwt. of metalliferous rock, consisting chiefly of carbonate of copper mixed with quartz and friable clay. These specimens are poor, being from near the surface, but they give every promise of a richer yield beneath. These are taken from a vein eight feet wide, running from north-east to south-west, and probably extending for some distance, as similar indications have been found at other places. The most important feature of the discovery, however, is its nearness to the coast, the lode not being more than seven miles from the sea, and little more than that distance in the tidal rise of the Umkomazi, where the river becomes navigable and accessible by small vessels. A township has already been laid out at this little harbour, which is only 30 miles south of Durban. The distance of the lode by land is only about 27 miles, 13 of which is a dead level. The land all round is set apart for the use of the natives, and Government will, therefore, have the disposal of the affair in their own hands. In all probability these mineral indications are but precursors of further discoveries. They occur in a range of hills which run parallel with the coast from the Amapondaland, through Natal into Zululand. At the southern extremity copper of fine quality exists, and it is now found at a higher point near the Illovo. Government has placed £1,000 on the estimates for next year in aid of mineralogical explorations.

Notes.

PRICE OF LAND IN PARIS.—The *Moniteur* gives the following as the price of land for building in several of the new streets of Paris:—Place du Théâtre Français, equal to £48 the square metre; Rue Turbigo and Réaumur, £34 16s.; Rue Lafitte and St. Georges, £33; Chaussée d'Antin and Rue Olivier, £28; Rue Lafayette, £42; Rue Taitbout, £40; Rue de Rennes (continued), near Mont Parnasse, £6.

NEW METHOD OF HORSE-SHOING.—The Paris correspondent of the *Telegraph* speaks of a new shoeing process which, he says, is coming into general use there. Instead of the wide and heavy plate hitherto fixed under the horse's foot, M. Charlier, the inventor, fastens a narrow iron band

in a rebate, paired round the lower external rim of the hoof. The latter is thus furnished with a resisting border, by which it is protected against wear, allowing at the same time all the other parts of the sole to keep their natural hold on the ground, and thus to preserve the normal form and constitution of the organ. This *périplantaire* mode of shoeing, as it is called, is simple enough. The new shoe is about two-thirds lighter than the old one, which proves a great relief to the animals, besides preserving them from most of the usual diseases and accidents of the foot. M. Charlier says that in the natural state, so long as the side of the hoof does not split, the whole member wears very well; therefore the problem to be solved merely consisted in preventing the hoof from splitting, and in preserving the rest of the foot. So he simply gives it an artificial border, stronger than the natural one, but without compressing or damaging the foot. The new shoe appears to make the horse particularly sure-footed, and to answer as well for large as for small horses. There remains the question of cost. The iron employed must be of the best quality, but as the new shoe requires from a half to two-thirds less material than the old one, it comes to the same. It appears that, after a fair trial, the Voitures de Paris Company have purchased the right of shoeing all their horses on this plan, and it has also been tested by one thousand omnibus horses.

SCHOLASTIC REGISTRATION ASSOCIATION.—At the last annual meeting of this association it was resolved to make the association the basis of a periodical "Educational Congress," in order to afford educators, and the friends of education generally, the opportunity of exchanging views on questions relating to the educational wants of the country. In pursuance of this resolution, a Congress is announced to be held at Birmingham on Wednesday, the 13th of November, when the following subjects will be discussed:—"How far will the proposed Scholastic Registration Act tend to raise the standard of education throughout the country, and promote the interests and efficiency of the scholastic profession?"—"How far is the science of education capable of development by the more specific training of educators, and by such measures as the institution of a special faculty of education in the universities of Great Britain and Ireland?"—"What means can be adopted for training teachers for upper and middle-class schools?" A large and influential local committee has been formed, including George Dixon, Esq., M.P.; and all those who are interested in the advancement of education and the prosperity of the profession are invited to attend. Full information respecting the proceedings of the congress may be obtained from the hon. secretary, Barrow Rule, Esq., Aldershot.

THE CITY COMPANIES AND TECHNICAL EDUCATION.—In a speech made on the occasion of the recent election of the Lord Mayor, Mr. John Jones, a member of the Livery, said:—"The ancient Livery companies of the city of London might still be made, as of old, germinating centres, and the only proper medium by which improved culture could be given to the artisans of England. Their ancient *prestige* might be revived if the Lord Mayor would but call upon them to act up to their original objects, to see that apprentices in the various handicrafts were well taught, and that the knowledge of discoveries in science and the mechanical arts was well disseminated among the artisans of that great city. For ages in those civic companies there had been arrangements for settling such disputes in trade as had culminated, for the lack of such arrangements, in the revolting disclosures which had been made at Shofield, and the Lord Mayor for the time being, by putting himself at the head of such a system as was known in France by the name of *Conseils des Prud'hommes*, might settle the due proportions of labour and capital in their joint action and endeavours whenever those may be in dispute."

Journal of the Society of Arts.

FRIDAY, OCTOBER 11, 1867.

PARIS EXHIBITION.

The weather, or the condition of trade and of the money market, or both combined, are having a sad effect on the interest of the guarantors of the Exhibition; the number of visitors which it was expected would by this time be greatly increased, has fallen below 30,000 a-day. The coming of the Emperor of Austria will, doubtless, have a good effect, but his Majesty will not arrive here till the 24th or 25th instant. Arrangements are being made for a grand closing ceremonial, at which the remaining prizes, those in agriculture and horticulture, will be announced, and possibly distributed, with others not yet delivered. The presence of the Emperor and Empress of Austria will give *éclat* to this closing *fête*.

M. Matthieu, member of the Institut, who was charged with the duty of drawing up a report on the weights and measures of various countries, is said to have completed his work, and delivered it to the committee specially appointed to take the subject into consideration; it is added also that the committee has drafted a plan for a general system of weights and measures.

The Minister of Commerce has recommended the Emperor to permit sale by auction, or otherwise, of goods or other objects in the Exhibition, and a decree to that effect has just been promulgated. The proprietors of the International Club in the Exhibition grounds are thereby authorised to establish a room for sales by auction, or otherwise, provided such sale shall not interfere with the regulations of the Exhibition. Before proceeding to carry out the measure thus permitted by the decree, proprietors of the club are bound to deposit 60,000 francs (£2,400) in the hands of the directors of the Caisse des Dépôts et Consignations.

MUSEUM OF THE ARCHIVES OF FRANCE.

This new museum, the opening of which was announced in the *Journal* a few weeks since, presents a highly interesting collection of documents and objects illustrative of the history of France. The museum occupies six rooms in the Hôtel des Archives, formerly the residence of the Prince de Soubise, in the Rue de Paradis, not far from the Place de la Bastille; the courtyard, the grand staircase, and other parts of the hôtel are remarkable in an architectural point of view. The museum is on the first floor, and the first *salle*, which is the largest of the six, contains a large number of rare charters, diplomas, and other documents of the Merovingian and Carolingian periods, written on papyrus or parchment; charters of the fourteenth century; and registers, cartularies and illuminated manuscripts of the thirteenth, fourteenth, and fifteenth centuries. Amongst the documents on papyrus of the seventh and eighth centuries are several Acts relating to the Abbey of Saint Denis, by Clotaire II. (625), Dagobert I., Clovis II., Clotaire III., and Charles the Bald; and a letter addressed by Maginarius, Abbot of Saint Denis, to Charlemagne. In cases, in the centre of the room, is a fine collection of miniatures and illuminations on vellum, including some very remarkable specimens; one of these is a manuscript, entitled "Universal and Genealogical History," illustrated, commencing with the history of Adam and Eve in Paradise; it is written on twelve sheets of parchment, in the form of a roll, twelve yards long and more than twenty inches wide; there is no date, but the manuscript is in the style of the fourteenth century.

In the same apartment is a series of wax tablets, fourteen in number, on which the accounts of the Hôtel of Saint Louis were kept by Jean Sarragin, during the years 1256 and 1257; the writing was executed with a stylus. Most of these curious tablets are in excellent preservation. In the second room are charters and diplomas, being the signatures of monarchs and others of the sixteenth century; there is also a note in cypher by Jeanne d'Albert, Queen of Navarre, and mother of Henri IV. The third apartment was formerly the bedroom of the Prince de Soubise, is decorated with old carved wood work, tapestry, and some paintings by Boucher, and contains seals and manuscripts of the time of the revolution; several of these, executed by the unfortunate Louis XVI. while a prisoner in the Temple, bear the signature Louis Charles Capet. The next *salle* was formerly the boudoir of the Princess de Rohan, and in the centre is a glass case containing documents of the time of Napoleon, letters of various members of the Imperial family, and the will of Napoleon, exhibiting the codicil written by his own hand at Saint Helena. The other two apartments contain documents of still later date than the preceding. It is curious that Paris should not previously have possessed any public collection of this kind, with the exception of some few historical documents to be seen at the Louvre and in the Imperial library, while Rouen and several other public libraries in the provinces are famous for their illuminated manuscripts.

It is not generally known that the establishment of the Archives of France is connected with a college called the Ecole Impériale des Chartes, established in 1821 for the study of documents, dialects, and writings of the middle ages; the college grants the degree of *Archiviste Paléographe*, which is held in high estimation, and the keepers of local archives are elected from amongst the successful students of the college.

MINERAL RESOURCES OF NEWFOUNDLAND

The following report on this subject has been addressed to the Crown Agent for the Colonies:—

SIR,—A copy of a correspondence between his Excellency A. Musgrave, Esq., Governor of Newfoundland, and the Crown Agent for the Colonies, in London, has been placed in my hands, relating to the mineral resources of that colony, it being the purpose of the authorities to bring certain portions of country where minerals are supposed to exist to public sale.

As I have been engaged for the last three years in making a geological survey of Newfoundland, and have during that time explored a considerable part of the island, the local government have been pleased to direct me to express my views on this matter, so far as my present information will permit, in answer to certain queries made in a letter to His Excellency the Governor, from Mr. W. C. Sargeant, Crown Agent for the Colonies, dated the 30th March, 1867.

It may be well to premise these remarks by stating that in a wild and unknown country there are many and serious difficulties to contend against while working out the structure and distribution of the geological formations, and ascertaining their several characteristics, mineral and fossil; and that while pursuing these duties it would be utterly impracticable for the geologist to devote such time, labour, and expense upon any one particular spot or even locality as would be required for the development of ores or minerals with a view to practical mining, yet in carrying out such an investigation there is no doubt a great amount of information may be acquired in a great degree important to mining adventure.

It is greatly to be regretted by all who have the interests of the province at heart, that grossly exaggerated statements, referring to the mineral wealth of New-

land, have at various times been circulated in a manner which has tended to retard rather than advance the object desired, propounding assertions too palpably unable to admit of any consideration on the part of interested persons. Nevertheless, there can be no doubt that the mineral indications in many instances are very encouraging, and may ultimately prove of great importance to the colony.

The mineral productions which have been discovered in various times on different parts of the island are the following: silver, copper, lead, iron, and manganese, with red and variegated marbles, large masses of gypsum in the lower carboniferous formation, plumbago and steatite. Peat and shell marl abound at many parts of the surface.

A large tract of country is spread over by rocks of Silurian age, but it is still doubtful whether they contain seams of coal sufficiently thick to be of commercial value. There are but three places, that I am aware of, where mining has been seriously attempted,

viz., the "Terra Nova" mine, in Little Bay or Bay Vert; the "Union" mine at Tilt Cove, in Notre Dame Bay; and the "La Manche" mine at the head of Placentia Bay.* Copper ore in association with iron pyrites is produced at the two former of these locations, galena or sulphuret of lead from the latter, and as the work done at these places may to a certain extent afford an index to future similar operations, I shall endeavour to give my views respecting the geological horizon to which they belong, and the mode of their occurrence.

The accompanying map will show to a limited extent the distribution of that part of the lower Silurian system in which the Terra Nova and Union mines are situated; and the plan of the former, surveyed by myself, will illustrate the actual condition of the place up to the commencement of the present year; while, in order to make the matter of distribution as intelligible as possible, the following tabular arrangement of the formation is quoted from an Appendix to my Report for the year 1864-65, by Sir W. E. Logan:—

Sir W. E. Logan remarks, in the same appendix, with regard to a portion of this formation:—"The Quebec group, 6, 7, and 8, is divided into three parts, named from localities where they are largely displayed. The first, or Lévis division, embraces the limestones and black slates of Point Lévis, Orleans Island, and Philippsburgh, with their numerous fauna of trilobites and graptolites, for the most part identical with those of the Skiddaw slates. The second, or Lauzon division, was at first united with the preceding, but has been separated from it on account of its great mineralogical importance and distinctness, it being the metalliferous zone of the lower Silurian in North America. Magnesian rocks, including dolomites, magnesites, serpentines, diorites, chloritic and steatitic beds, with micaceous and gneissic strata, characterise the Lauzon division, which is moreover rich in copper ores, chiefly as inter-stratified cupriferous slates, and is accompanied by silver, gold, nickel, and chromium ores; the only fossils certainly recognised in it are an *Oboloides* and two species of *Lingula* at its summit."

It will be seen by reference to the table that the Quebec group is fully developed in Newfoundland, and there is no doubt it is characterised in many respects by similar qualities to those displayed in the same formation in Canada. It is in the Lauzon division of this group (No 7 of the table), that the ores of copper have been hitherto chiefly observed, and it is in the same part of the formation that the two openings before referred to are situated. Dr. Sterry-Hunt, of the Geological Survey of Canada, in a pamphlet published in the *American Journal of Science*, in May, 1861, expresses his views regarding the economic importance of the Quebec group

in the following words:—"This Quebec group is of considerable economic interest, inasmuch as it is the great metalliferous formation of North America. To it belongs the gold which is found along the Appalachian chain from Canada to Georgia, together with lead, zinc, copper, silver, cobalt, nickel, chrome, and titanium. I have long since called attention to the constant association of the latter metals, particularly chrome and nickel, with the ophiolites and other magnesian rocks of this series, while they are wanting in similar rocks of Laurentian age. The immense deposits of copper ore in East Tennessee, and the similar ores in Lower Canada, both of which are in beds subordinate to the stratification, belong to this group. The lead, copper, zinc, cobalt, and nickel of Missouri, and the copper of Lake Superior, also occur in rocks of the same age, which appears to be pre-eminently the metalliferous period."

A perusal of the survey of the Union mine will explain the conditions under which the ore occurs, and the relation the cupriferous strata bear to the serpentines; while the plan of the works and the accompanying section will show the actual progress made nearly up to the present time. Operations were first commenced at this place in 1865, during which year about 500 tons of ore were extracted, varying in quality from 7 to 23 per cent. of copper. In 1866 about 2,500 tons of ore were brought to the surface, which was divided and classed according to quality, as No. 1 and No. 2 ores. An analysis by Bath, of

* Small openings have been made at a great number of places where metalliferous indications presented themselves, but the work done at those parts has been too limited to be properly designated as mining.

Swansea, of some good average specimens of this ore, is said to have yielded from 17½ to 21½ of copper. About 120 men of all classes have been recently employed at these works.

An extract from a narrative of my own proceedings during the year 1865, addressed to His Excellency Governor Musgrave, expresses my views as to the probable mode in which these ores will be found to occur in this formation generally, and at this place in particular:—"While in the neighbourhood of Tilt Cove I took the opportunity of crossing over the peninsula from Shoe Cove to La Icie, in order to get a stratigraphical section of it as well as my time would permit. Without entering into particulars as to the lithological character or stratigraphical arrangement, I may broadly state that the ore deposits of Tilt Cove occur under conditions strikingly similar to those known in Eastern Canada, and to characterise rocks of contemporaneous origin. By reference to the plan, it may be observed that the metallic material is arranged in isolated, irregularly-shaped masses, through a set of strata conforming with beds above and below, of a calcareo-magnesian quality, and that these beds are succeeded on the north by a great body of serpentine. As, from all I have hitherto seen, and from all the information I have been able to gather, the copper will in this country most frequently be found to occur in a similar manner, that is to say, in beds, rather than in regular veins or lodes, I think it right to call particular attention to the facts of this case, and to express a strong opinion, for the benefit of adventurers or explorers, that the immediate neighbourhood of the serpentine rocks, wherever they may be found to exist, will be the most probable position for their labours to be crowned with success. These serpentines, besides being associated with many valuable metallic substances, frequently afford a beautiful variety of marble, which in many cases might of itself prove of considerable importance, added to which may be enumerated the frequent occurrence of other reverberatory minerals, such as soapstone, potstone, asbestos, and talc. Chromic iron is frequently associated with the serpentine, and may probably be discovered in some parts in workable quantity."

The experiment of the Union Mine has, so far as it has yet gone, proved eminently successful, and as the indications on the east side of Winsor pond exactly correspond with those on the west side, where the work is proceeding, it is but reasonable to infer that a vast amount of ore may be extracted from the same deposits beneath the pond, and further on in the strike on either side.

At the Terra Nova location the experiment of mining has not hitherto proved remunerative, but its position in relation to the serpentine may be regarded as favourable and worthy of more extended trial. The metalliferous stratum upon which the principal shaft has been sunk, and upon which the drifts are driven, appears chiefly to consist of an enormous mass of iron pyrites, with an occasional admixture of yellow sulphuret of copper. Native copper has been observed occasionally in small quantities among the serpentine. Reference to the plan will show that the mining done up to the end of last year is confined to a small space, and that the ground is by no means thoroughly proved, although a very large amount of labour and expense has been bestowed upon the surface.

From what has been stated above, therefore, it will be evident that the distribution of the serpentine is a matter of high importance to those interested in the discovery of metalliferous ores, and, as the formation of which it forms a part is largely developed in various parts of the island, there is good reason to anticipate that Newfoundland will become, in course of time, a great field for mining industry. The serpentine is largely developed on the north side of Hare Bay, and between that bay and Pistolet Bay; it occurs also in great extent on the west side of the island, at York Harbour in the Bay of Islands, and from the southern arm of that bay to Bonne Bay.

From the evidence procured from Topmail Head, Conception Bay, there appears to be a great range of strata of more ancient date than the lowest Silurian, or newer than the Laurentian, consisting of slates, and interstratified bands of quartzite, diorite, and jasper beds, the latter often of a red colour, with a mass of red or grey altered sandstone and conglomerate at the summit. These rocks are intersected by numerous veins, most frequently of quartz, but in many cases of calc spar, or a mixture of the two, which occasionally contain the ores of lead, sometimes associated with silver and copper. The rocks of the La Manche locality will probably prove to belong to this series, but the formation has as yet only partially been followed out. As regards the mine, circumstances at the time of my visit to the latter place unfortunately prevented me from making a thorough examination of the ground, and such information as I was able to obtain is given in a preliminary report of mine, addressed to his excellency on the 15 March last:—

"The La Manche mine is situated near the north-eastern extremity of Placentia Bay, between Little Southern Harbour and Little Bay. The vein thus worked for lead varies in width from three to six feet, and is chiefly of calc spar, much of which is tinged with a pale pinkish amethystine colour. Sulphate of barytes, quartz, and fluor spar, are more or less distributed through the vein, the walls of which are frequently lined with beautiful crystals of amethystine quartz, and occasionally with blue or green malachite.

"The ore is distributed irregularly through the whole thickness of the vein, sometimes in pockets or lining drusy cavities or cracks, called vughs by the miners, but there appears to be also a pretty regular and continuous string of ore near the middle of the lode, of from one to four inches in thickness, from which the ore, as it is termed, is chiefly derived. The run of the vein is about north 63° east (true bearing) from the water's edge, and its altitude vertical, maintaining that course and altitude with great regularity, and being traceable on the surface for a considerable distance. The lode consists of a set of green, very hard and brittle, compact cherty or jaspery slates, which cleave exactly with the bedding, and for the most part weather an opaque white, which discolouration extends into the stone to an inch or more. The dip on the south-eastern end of the lode is about north 27°, west 25°; that on the north side points in the same direction, but with an increased rate of inclination. From the position of the vein to the entrance of Little Southern Harbour, the measures gradually accumulate upon this dip, but as there are several dislocations observed in the cliff, it is probable the same stratum may be repeated. A considerable amount of red strata are visible in the cliffs of a hard jaspery character, alternating with a rock of a dark bottle-green colour, having the aspect of diorite, but, being incapable of landing to examine that part of the coast, I am unable to state the mineral character with certainty."

Indications of lead ore are of frequent occurrence at many parts where rocks supposed to be of the same horizon display themselves, as in the cliffs of Topmail Head, at Cape Chapeau Rouge, at Lawn, where some beautiful samples of silver ore were likewise discovered, and in the harbour of St. John's itself, facts tending to induce the belief that mineral treasures may reasonably be expected, in course of time, to be brought to light. Veins containing lead, however, are apparently not confined to any particular formation; the presence of that metal has been observed as low as the Laurentian, and as high as the coal measures; but whether the veins holding the ore are of one or different ages, has not been ascertained. One vein, which appears to be more recent than the lower carboniferous, and is mentioned in the narrative of my expedition in 1865, appears to be worthy of trial. The following is quoted from the narrative alluded to:—"It has been already stated that sandstones of the coal

that it can be obtained at nearly every part in unlimited abundance. Ponds and lakes are dotted over the surface of the country to such an extent that it may be doubtful whether the superficial area covered by water is not equal to that of the land, and many of them, being at a great elevation, give rise to innumerable mountain torrents, which give their tribute to the main stream in the valleys at short intervals between each other.

The climate of Newfoundland is not by any means so severe as is generally supposed. The range of the thermometer is very much less than it is in any part of the Canadas, the heat in summer seldom exceeding from 70° to 75° Fahr., while the cold in winter is seldom very much below zero. The fogs, generally supposed by those unacquainted with the country to envelop the whole island almost eternally, have but a limited existence in the interior, and are not by any means prevalent on the northern or western shores, although they certainly prevail on the southern shores generally, and at Placentia and Trinity Bays particularly.

Provisions have hitherto been chiefly supplied from Halifax or Prince Edward's Island, but, should mining and agricultural pursuits combined be once fairly established, I see no reason to doubt the capability of the island to raise all the necessaries of life for its inhabitants.

I have the honour to be, Sir,

Your obedient servant,

ALEX. MURRAY.

W. C. Sargeant, Esq., Crown Agent for the Colonies,
Spring-gardens, Charing-cross, London.

The following extract, from a letter written by Mr. Murray, on the 10th September last, and dated Union Mine, Salt Cove, Newfoundland, gives more recent information:—

"The prospects of the mine are of the most highly encouraging nature, and as it may be of importance that the truth should be known in England, I should like my opinion of the matter published in the *Journal*, as a rider to my letter to Mr. Sargeant.

The production of copper ore from the commencement of the present year has been as follows:—

"The amount of ore accumulated during the winter of 1866-7, and shipped for Swansea, up to the 1st August, 1867	2,200 tons.
"The amount of ore on the floor ready for shipment	880 "
"Ore ready in the mine	500 "
	3,580 tons.

And if the necessary shipping is supplied, the total amount of ore exported for the season will not be less than 4,000 tons. In working out this, the masses of ore have in no one case been exhausted, but simply driven through and the material extracted from the drifts; the experiment of proving the ground being carried on all the time, and constantly exhibiting new and most important masses; and I have no hesitation in stating, from my own personal observation of all the circumstances, that the ore now in sight is sufficient in itself to keep up a supply, at least equal to that of the present season, for several years to come.

"I consider that the facts, which are indubitable, of the success of this mine ought to be of such interest to capitalists as to induce many to venture on similar experiments in different parts of this island, where the geological conditions are similar or identical; but I would recommend at the same time that great care should be taken to be assured of the said geological conditions, as many metalliferous indications occur at parts where, so far as I can judge, they are of little importance, although ignorant and interested parties abound who will unhesitatingly give most exaggerated statements without the slightest foundation in fact."

STREET AND ROAD FOUNDATIONS AND SURFACES.

By W. BRIDGES ADAMS.

People connected with railways talk at times about "permanent way," a very desirable quantity, but still as far from common practice as "squaring the circle," or other puzzling problems of the schools. But it is not surprising that the modern iron ways should be ephemeral when our ancient ways called roads and streets have never yet attained a permanent condition. In times for the streets it is alleged that the constant necessity of digging up the surface to get to gas and water pipes and sewers, prevents the possibility of permanent structure.

But supposing a position with a surface not to be disturbed by hydro-pipes and hydrogen-pipes, are we prepared with any mechanical structure as a covering adapted for permanence? We have had wood, and stone, and iron, and broken stones, and asphalt, and asphalt and stone, and big stones, and small stones, but we have had nothing that, under heavy work, lasts more than a year or two. The reason for this is that they have no foundation worthy the name: the surface is relied on both for strength and wear. Sometimes concrete is applied as a foundation, but too thin to resist, and therefore breaking, as each stone is rammed down in succession like a row of nails, by passing wheels.

Now suppose our great London Edile, Sir John Thwaites, should, for once, take it into his official head that there ought to be, and should be, laid down a sample London road, and say, *sic volo sic jubeo*, there is an admirable site at hand, and under his control, the Thames Embankment, as yet guiltless of underground tubes save the brick tunnel.

Sir John Thwaites will therefore reason thus:—"A good road must consist of two parts; a solid, firm, but still as elastic foundation,—a substructure with a superstructure on it for the purposes of wear. It is well known that a surface of broad flag-stones is much less liable to disturbance than one composed of small stones, and the great size of the stones was the reason why the ancient Italian roads have descended to us undisturbed by time, though worn into gullies by the wheel tracks. Upon new embankments concrete is apt to settle and break. We want, therefore, a substance that will not settle and break. This is to be found in timber. But timber is apt to rot. But timber creosoted is not apt to rot, and is very durable. A creosoted timber floor, then, is the thing to aim at, but not an ordinary floor of boards laid down on joists."

Sir John will say, with sound, common Saxon sense, "Let us lay down the rules after the fashion of Mr. Glasse:—"

"Take a sufficient number of the common deals of commerce, nine inches wide and three inches thick, and saturate them thoroughly with creosote, then level the surface of the projected road and lay down on it the deals side by side, then cross these deals with others at a right angle, till a double floor is formed, which will not require any fastenings but the curb stones to keep them in position; the road proper is thus complete, and only needs surfacing. A very good surface could be made by laying down kentledge, or ships' cast-iron ballast, measuring about two feet in length by four inches square; if objected to as too heavy it might be cast in the form of hollow boxes, or hollow cubes in ridges might be applied, or stone cubes made to fit accurately to each other and on to the planking, every side being square and smooth, but with the edges arrised for horses' feet-hold. In this mode the road might be made nearly flat. If rough cubes were used, they would need to be grouted with hot lime grout.

"Such a road would at all times preserve an even surface, and blows from horses feet and wheels would be distributed over a large space through an elastic medium, which, while modifying noise, would greatly diminish resistance to traction, and prevent breakage of the surface as well as wear. It would be like travelling

ge sheet of ice. The road might be more costly tset than other roads, but it would be infinitely able, and upon the whole it would probably be han the sham structures now passing under the roads. It would, moreover, be most rapidly laid d renewed, and be perfectly free from dust and , and very easily cleansed on the surface; and b highly appreciated by the public using it. On e, therefore, it is decidedly a proper thing for d of Works to set so good an example." sink the public will agree with Sir John, and on Hausmann will pale his pretensions before gs of our great London Edile, who will thus

"Achieve a name,
Beyond all Greek, beyond all Roman fame."

en Sir John has set this good example, perhaps wper will take heart-o'-grace, and, for the first ve us really dry surfaces in front of Buckingham and the Horse Guards, with Macadam, if he it, on a creosoted timber floor.

Manufactures.

EXPLOSIONS.—Mr. L. E. Fletcher, chief- r of the Association for the Prevention of boiler Explosions, in a recent report states that, the past month 272 visits of inspection have ade, and 624 boilers examined, 392 externally, ernally, eleven in the flues, and 215 entirely, n addition four have been tested by hydraulic re. In these boilers 170 defects have been dis- l, six of those being dangerous. He then gives a : statement of defects, omissions, &c., met with in llers examined, from which it appears that a high r of 'entire' examinations is still maintained, as as 215 boilers, out of the 624 inspected during the month, having been examined 'entirely,' that is to ternally as well as in the flues. It is on these e' examinations that the Association relies more ally for the prevention of explosions, and there- attaches considerable importance to their in- gely high number. This is greatly due to the ng of the guarantee system, which makes an d 'entire' examination of every boiler an essential tion of granting the guarantee. The defects met

however, during the month were of an ordi- character, and do not present any features of ient interest to merit detail reference. As regards sions, he says:—"Explosions are not occurring the same rapidity this year as in many previous ; and on the present occasion, as in the preceding h, I have but one explosion to report, which red to a boiler not under the inspection of this ciation. No. 16 explosion is an illustration of the er of setting boilers on mid-feathers, especially i the boilers are of large diameter. This explosion, h resulted in the death of two persons, as well as in ry to two others, occurred at a woollen mill, at ty minutes after eight o'clock on the morning of rsday, July 11th, when the engine was at rest ng the breakfast time. The boiler was one of a s of three set alongside of the mill, and parallel it, all of them being internally fired and worked at ressure of about 30lb. on the square inch. The ex- led boiler, which was the inner one of the series, set nearest to the mill, was of the Cornish class, ng a diameter of nine feet, a length of twenty-six ; and being made of plates 17-16th of an inch in kness; while the internal tube, which ran through boiler from one end to the other, measured five feet diameter at the furnace end, and tapered down to r feet behind the fire-bridge. The boiler gave way the external shell, the primary rent occurring at the om, where in contact with the mid-feather wall, on uch it rested. This primary rent extended longitu-

dinally for a length of about ten feet, when at each end of this line it assumed a circumferential direction run- ng more than half way round the boiler, and in this way severing from the shell a tongue or partial belt, con- sisting of five widths of plate, and situated nearly mid- way between the two ends of the boiler. This tongue was opened out nearly flat, and the boiler thrown for- ward some fifty feet from its original position, passing on its way through a four-storied house, which it brought to the ground; while, in addition, a consider- able portion of the mill, close to which the boilers had been set, was blown down, the adjoining boiler in the series thrown from its seat, the boiler-house laid in ruins, and the mill brought to a standstill. The cause of this explosion I found, on visiting the scene of the catastrophe and examining the fragments of the ex- ploded boiler, to be apparent at a glance. The edges of the plates, at the primary line of fracture which had run along the mid-feather wall, were seriously reduced in thickness by external corrosion, being eaten away to the thickness of 1-16th of an inch, while in some places they were as thin as a sheet of paper, so that the wonder is, not that the boiler exploded when it did, but that it had not done so long before. A careful sus examination by a competent inspector would have shewn the dangerous state of this boiler in time to have pre- vented the explosion. Evidence to this effect was given at the inquest; a scientific witness stating that 'the explosion was not attributable to deficiency of water, but solely to extensive corrosion of the plates on the under side, caused by leakage of the seams, and damp- ness of the brickwork, which was a well-known source of danger, and ought to have been guarded against.' The jury brought in a verdict of 'Accidental death,' adding, however, that the owner of the boiler, as well as the person who had charge of it, were censurable for the explosion, though not criminally responsible, while the foreman took the opportunity of recommending that every millowner should have his boilers periodically examined. On this occurrence of another fatal ex- plosion to a boiler resting upon a mid-feather wall, the members of the Association may be once more appealed to to discontinue so dangerous a mode of setting, and to adopt side walls with suitable seating blocks instead. This latter plan is superior on many grounds. If the flues are damp the moisture rises more readily through the mid-feather than through the side walls, as there is, in most cases, less height of brickwork in the former for it to travel through. Also, any water that may either fall on to the boiler or leak from the seams, is more liable to lodge in contact with the plates on the top of the mid-feather than on the side walls, the bearing sur- face of the mid-feather being at the bottom of the boiler so that it collects all the drainage, and being horizontal so that it retains it, while that of the side walls is in- clined, and thus affords the water an opportunity of escaping. It is not thought, however, that the cor- rosive tendency of moisture is the only cause of the injurious effect of mid-feathers, but that it is materially promoted by mechanical action. A boiler does not 'ride' so com- fortably on a single longitudinal seating as when carried on two, and when the weight of a large boiler is thrown entirely on a mid-feather, a change of form frequently takes place with every change of pressure. This has been distinctly observed on the application of the hydraulic test, the internal pressure raising the boiler, while it might no doubt be seen in some cases on getting up steam. In making internal examinations of boilers set on mid-feathers, the plates at the bottom of the shell are not unfrequently seen to be flattened all the way along at the centre line, so that the mid-feather can be distinctly traced even inside the boiler. It will thus be seen that an alternate flattening movement is carried on throughout the line of the mid-feather wall on every variation of internal pressure, which tends not only to strain the ring seams of rivets and make them leak, but by its buckling action to 'fatigue' the metal, and thus

very much to accelerate the ravages of corrosion from moisture upon the body of the plates, so that a mid-feather wall may be said to produce a description of longitudinal 'furring' along its bearing surface. This will show the importance of the recommendation constantly made to those members who have boilers set on mid-feather walls, that they should have the brickwork ploughed out at the transverse seams of rivets for purposes of inspection. Without this it is impossible to ascertain the condition of the plates, since, although they may appear perfectly sound on each side of the mid-feather wall, especially if it be a wide one, they may yet be dangerously wasted in a longitudinal 'furrow' all along the centre line. These openings need not be large; it will be sufficient if they are about nine inches long by three inches high, and cut completely across the wall, so that if a light be held on one side they can be seen through. They need not be permanently filled up after an inspection, but merely stopped temporarily with a little fire clay, so as to be easily re-opened whenever re-examination is necessary. In conclusion, it is earnestly recommended that no boilers, having a diameter of five feet and upwards, should be set on mid-feather walls, but if in the case of small boilers, and under exceptional circumstances any of these walls should still be adopted, then the boilers should rest on suitable seating blocks, instead of on bricks; while the bearing surface should not exceed an inch in width for every foot in the diameter of the boiler, and sight-holes, as explained above, should be ploughed out at each of the ring seams of rivets." He then gives the following account of a fatal explosion of a hot-water bottle:—"This explosion took place on the 31st March, and though it cannot rank either among those of steam-boilers or household ones, yet, as it resulted in the death of one person, as well as in serious injury to two others, it is of importance socially; while, independently of its effects, it is of interest in a scientific point of view, and, therefore, the particulars of this explosion may be given, though it occurred only to a hot-water bottle. The bottle in question was of earthenware, of about a quart capacity, and used when full of hot water as a bed-warmer. It had been put to this service on a previous occasion, when the cork had been tied in with a wax end, such as is commonly used in shoemaking. When the bottle was wanted again for a similar purpose, instead of being emptied of its cold water and refilled with hot, it was put, all tightly corked, into the oven of a kitchen range, to be heated up entire. In a short time a violent explosion ensued, the bottle was burst in pieces, a corner of the oven door split off, and the fragments of iron and earthenware thrown into the room with so much force that three persons were seriously injured, one of them, a child, dying the day after. This explosion, though calculated from its simplicity to provoke a smile, is, in an engineering point of view, of considerable interest, and involves important principles. The explosion of household boilers is always attributed to the water supply being allowed to run short, and then suddenly re-admitted on to red-hot plates, which is supposed to be productive of a wonderfully disruptive force; while, with regard to explosions generally, it is too frequently thought that a gradual accumulation of steam is insufficient to produce the disastrous results attendant on them, which are therefore attributed to some sudden generation of pressure from the detonation of gases or other imaginary cause; while others again hold the opinion that no boiler can explode if suitably supplied with water, and that though it might rend, it would do so without violence. There is no getting away, however, from the facts of this explosion; its simplicity renders it most convincing. There was no pipe to suddenly re-admit the feed, as in the case of the household boiler, on to the supposed hot plates, while the circumstances forbid the explosion being attributed to any other cause than quiet internal pressure from the gradual accumulation of steam, which,

it will be seen, did not quietly rend the bottle, but violently exploded it. This little incident affords views expressed in the Association's report for 1867, relative to the explosions of household boilers, that they were due simply to the gradual accumulation of steam, and might be prevented by an efficient valve."

Commerce.

SUPPLY OF COTTON.—Messrs. George Farnley and Co., of Manchester, in their *Circular for 1867* say:—"With regard to cotton, although the season now begin rapidly to diminish for some months, all fears and anxiety as to the future supply are considered to have passed, for—with a stock of 8,000 bales in Liverpool at the end of last week, and 23,000 on the water, and with the most reassuring news from all the principal cotton-growing districts of the world, with such local exceptions only as the planters are liable to, however good the season—there does not seem to be any likelihood of scarcity; and as there is ample margin for a further fall before the market values are touched, we shall probably see a decline in prices until they become so low as to be unremunerative to the planter, and thus lead to a curtailment in the extent of land put under cultivation."

MEANS OF TRANSPORT IN ITALY.—The means of increasing and facilitating the means of commerce has often been urged by us (*Giornale delle Industrie* of Florence) as the only way to develop the industries and commerce of this country. It is unfortunately, that these resources have been neglected by themselves, and those whose interest it seems to be to promote such undertakings are opposed to any scheme of improvement. It will be necessary to mention the following well-known facts and industries in order to form an idea of the importance of a cheaper and more rapid means of communication to the future prosperity of the country. In the first place there is mineral fuel in Cadibona, Orta, and the centre of Tuscany; it is well known lignite, at present produced on a small scale, and easy means of transport from the pits' mouth to the principal lines of railway, would increase to a enormous extent. In Sardinia these railways are made between the principal towns; the traction has an important mission to fulfil. Road locomotives will play even a more important part in Sicily, many sulphur mines have been suspended on account of the serious expense attendant on the transport of the mines to the nearest seaport; and the same may be said for the various other products of this island, especially wines, from which it might derive immense benefits. The same will be required for the Neapolitan provinces, and it is no secret that even in the Venetian provinces the transport of goods is a most formidable blem. Road locomotives are required at Volterra for transport of alabaster; at Serravezza and Stazzano for marbles; at Massa for the carriage of marbles, and copper; at Spezia for the development of the immense mineral wealth that exists in the Apennines that surround it, stretching from the Apennines on the one hand to the plains of Padua on the other. Savona also for the glass works and manufactures in the neighbourhood. The town of Chiari, rich in agricultural produce, requires to be in communication with the Piedmontese railways. The northern part of the province of Novara, and finally, a number of small towns and villages in the Venetian and Venetian provinces, are in the same position. In conclusion, everything tends to show that a system of steam communication on the common cannot fail to be attended with most beneficial results.

NEW TELEGRAPH TO INDIA.—A telegraphic conference has been held at Berne, which is said to have resulted in the signature of a draft treaty between France, Switzerland, Austria, and Turkey, with a view to the establishment of a line communicating with India without touching the soil of Prussia or Russia. Switzerland undertakes to lay down a special line for dispatches passing between Paris and Constantinople, which are to be entirely free from all control by the Swiss authorities, who will, however, receive a fee of one franc for each ordinary dispatch.

Colonies.

TRADE OF VICTORIA.—The imports for the first five months of the year have fallen short of those for the same period of last year by £691,968, and last year was a bad one. In the same period the exports have increased by £231,855. If the latter sum had represented articles of manufacture it might have been matter for congratulation, but unfortunately it represents only gold, of which the export of the produce of this colony exceeded that of 1866 by £337,012. The balance of imports over exports in the first five months of 1866 was in favour of the colony to the extent of £804,041, but during the same period of the present year it was only £129,722. The *Melbourne Argus* says:—"The colony unquestionably owes therefore to the operation of the tariff a loss of nearly £700,000 in the trade of the first five months of the year, without placing any value on the natural increase of business which ought to have accrued from the ordinary progress of a young country full of resources. But even these figures do not show the full extent of the loss which the country is sustaining through the operation of the tariff. In the first five months of 1866 we received from New Zealand 133,884 ozs. of gold, worth say £535,536, whilst in the same period of this year we imported only 81,836 ozs., worth about £327,344. That gold may be taken as representing the comparative value of our trade with New Zealand in these two periods. The gold-fields of the west coast of New Zealand are certainly not less productive than they were a year ago. The contrary, indeed, is the case. They are more numerous, more populous, more productive, and yet our trade with them has not only not increased, but has absolutely fallen off by over £200,000. None of the other countries have contributed materially, if at all, to make up this deficiency."

EXPLORATION OF NORTH AUSTRALIA.—The Government of South Australia has resolved upon making another expedition to the northern territory, under the command of Captain Cadell. Burke Town is to be the rendezvous, and in about three months the captain is to be at that seaport, when he will inform the South Australian Government of his ulterior intentions. Should all be in order on his arrival there, he will set sail, and proceed with the exploration of the whole of the Adam Bay country, besides Port Darwin, Anson Bay, Port Keats, and the Victoria River. It is probable that this expedition will be of great value, as Captain Cadell is provided with an ample number of horses, provisions, and men, and his vessels are also good ones.

THE CIVIL SERVICE GEOGRAPHY. (*Lockwood and Co.*) This is a manual of geography, general and political, arranged especially for examination candidates and the higher forms of schools. It is the work of the late Lancelot M. Dalrymple Spence (of H. M. Civil Service), and has been revised throughout by Thomas Gray, one of the Assistant-Secretaries to the Board of Trade. In the introduction, the author says that he has endeavoured

to supply a want once experienced by himself, and, he believes, still felt by many about to undergo a Civil Service or other examination, where geography is one of the proposed subjects. The two great objects to be kept in view by the student are, to get mapped out in his mind the relative situations of places, and to acquire a knowledge of the general, political, and physical characteristics of each country. On this plan the present work is framed. To assist the student in attaining the first object, tabular lists, geographically arranged, of the principal divisions, towns, seas, gulfs, rivers, mountain ranges, &c., are prefixed to the accounts of the various countries, &c., comprised in the great divisions of the globe; and to aid him in acquiring a knowledge of the general, political, and physical characteristics of each country, a detailed description of all the most important countries in the world is given, their colonies and dependencies, with their mountains, rivers, lakes, and islands; their mode of government; their manufactures, exports and imports, population, army and navy, and many other particulars, are also described. The student is particularly recommended in this work to draw rough outline maps; for the purpose of learning geography (says the author) elaborate map-drawing is not required, and to attempt it is a great mistake, since, besides wasting much time, it is apt to divert the attention of the pupil from that which is the main object of map-drawing—viz., to fix in the mind a clear idea of the relative situations of places—and to concentrate it upon the neat execution of the drawing on which he is engaged. Some specimens of outline maps are introduced. In the compilation of this work the author has consulted the best and latest authorities, and it will doubtless be found generally useful, whether as a text-book for schools, or as affording a speedy method of acquiring knowledge for examinations. It will be found of value as a book of reference, for it includes a general index, which contains upwards of three thousand names.

Notes.

TELEGRAPHIC DISPATCH STAMPS IN FRANCE.—There has been a report some time afloat in Paris that it was the intention of the Government to introduce special stamps for dispatches; this will shortly become a reality; the stamps are already prepared, and specimens of them are to be seen in the Exhibition at the Champ de Mars. When a dispatch has its proper stamp attached to it it may either be thrown into a box to be provided for the purpose, at a telegraph station, or it may be sent through the post office in an envelope stamped as a letter, and marked "Telegraphic Dispatch." Some other improvements in the telegraphic service are to be introduced at the same time, but they are not yet made known. The boldness with which reforms have been introduced into the telegraphic system of France is well justified by the results achieved; the number of private dispatches in a year having increased from 48,103 in 1852 to 2,842,554 in 1866, and it is confidently anticipated that the facilities afforded by the use of stamps, and a proposed reduction in price, will create an immense further increase.

SUPPLY OF WATER TO PARIS.—The arrangement for completing the last link of the proposed chain has just been made by the adjudication of the contracts for the works necessary for conveying the waters of the Vanne to Paris. The estimate for these works, including pipes and other iron work, was nineteen million and a half francs (£780,000), but there were a great many tenders, and a considerable reduction is said to have been made on several items. The water of the Vanne will have to be carried across nearly the whole of the department of the Yonne, a portion of those of the Seine-et-Marne, and of the Seine, to reach the new reservoir of Montrouge, which has already been mentioned in the *Journal*.

THE UNIVERSITIES OF ITALY.—The University of Salerno, the first that was founded in Europe, dates from the early part of the 12th century. The university of Bologna was founded in 1158; that of Naples in 1224; the celebrated university of Padua in 1238; that of Rome in 1245; of Pisa in 1333; Palermo in 1394; Turin in 1405; Florence in 1438; Catania in 1445; Parma in 1482; this university was reorganised in 1606. The university of Macerata was founded in 1540; that of Messina in 1548; of Mantua in 1625; in the island of Sardinia the university of Cagliari, in 1720; the university of Sassari in 1765; and that of Genoa in 1812.

Proceedings of the Society.

MEMORIAL TABLETS OF GREAT MEN AND EVENTS.

In order to show how rich the metropolis is in the memory of important personages and events, which it would be desirable to mark by means of tablets on houses, the Council have caused an alphabetical list to be prepared, the third part of which is now inserted. Other parts will follow. The Council request the assistance of members of the Society in completing and correcting this list, especially with reference to dates and the insertion of other names.

Whilst the Council intend proceeding with this work, they desire also to see it carried on by others—either by corporate bodies or individuals—and the Council will be happy to be instrumental in procuring suitable tablets from the manufacturers.

Eldon, John, Earl of, Lord Chancellor (b. 1751—d. 1838); a templar. Cursitor-street (No. 9?), Chancery-lane, was what he called his first lodge, and from here, in early life, he told his secretary he had often ran down to Fleet-market with 6d. to buy sprats for supper. He lived in No. 6, Bedford-square from 1804 to 1815, and here occurred the memorable interview between him and the Prince Regent, afterwards George IV. The latter was determined to have his friend Jekyll, the great wit, appointed to the vacant office of Master-in-Chancery; this Lord Eldon rejected. To accomplish his purpose, the Prince walked straight into the Lord Chancellor's bed-room, when ill in bed, and requested him to do as he wished; on being at once refused, he stated his intention of staying where he was till the appointment was made, the prince pitying the chancellor because he would never see his wife again. He built the house at the corner of Hamilton-place, Piccadilly, which was his last London residence. A portrait of him hangs at Merchant Taylors' Hall, and another in the gallery at the Privy-garden, Whitehall.

Elizabeth, Queen (b. 1533—d. 1603); dined at the "King's Head," No. 53, Fenchurch-street, off pork and peas, after attending service at All-Hallows-Staining, Fenchurch-street, on her release from the Tower. The metal dish and cover she is said to have used are still preserved; lived, when a girl of 13, in the same house, in Chelsea, with Queen Katharine Parr and her second husband, Thomas Seymour, the Lord Admiral, afterwards beheaded; also lived in Durham-house, Strand, which was granted to her by Edward VI.; opened the Royal Exchange in person, January 23rd, 1570, and on that occasion dined at Sir Thomas Gresham's house in Bishopsgate-street; was present at the house-warming in Sir Robert Cecil's house (Salisbury-house), on December 6th, 1602; she died at Richmond, and her body was brought with great pomp, by water, to Whitehall; was buried, and there is a monument to her memory in Westminster Abbey. The statue of her over the Fleet-street doorway of St. Dunstan's-in-the-East is the only known relic of any of the old

City gates, and stood in the west front of Ludgate, Temple-bar not being a City gate, but only a bar to mark the liberties of the City.

Ellesmere, Thomas Egerton, Lord, Lord Chancellor (b. 1616—d. 1700); lived in York-house, Strand; was a student at Lincoln's-inn.

Ellis, George Agar, Lord Dover; lived at Melbourne-house, Whitehall, now known as Dover-house.

Ely, Bishops of, Ely-house; 37, Dover-street, Piccadilly, is the London residence of the Bishops of Ely; Ely-place, Holborn, occupies the site of their "hostell," or ancient town house.

Empson, Henry VII. Emissary; lived in Walbrook, "in a fair house with doors," leading into the garden of the Prior of Tortington, now Salter's-garden.

Ersine, Thomas, Lord, Lord Chancellor (b. 1750—d. 1823); he commenced life as a sailor, then became a soldier for three years, and then studied the law; student at Lincoln's-inn; lived at No. 36, Lincoln's Inn-fields, in 1805. A statue of him stands in Lincoln's-inn Hall.

Ethelbert, King of Kent (b. 616); founded St. Paul's Cathedral.

Etty, William, R.A. (b. 1787—d. 1849); painter; lived at No. 14, Buckingham-street, Strand, from 1826 to within a few months of his death.

Eugene, Prince (b. 1663—d. 1736); stayed at Leicester-house when on a secret mission to England for the purpose of preventing peace between England and France.

Evans, John Rev., the astrologer; lived in Gunpowder-alley (No.—?), Shoe-lane; it was here that he gave William Lilly his first lesson in astrology.

Evelyn, John (b. 1620—d. 1706); was a templar; lived about nine doors up on the east side of Dover-street, Piccadilly; lodged at the "Three Feathers," in Russell-street, Covent-garden; took a house in Villiers-street (No.—?), York-buildings, Strand, in order to educate his daughters; was taken prisoner in Exeter Chapel, Strand, for attending service on Christmas day.

Fairfax, Sir Thomas, afterwards Lord (b. 1611—d. 1671); the Parliamentary general; married at the parish church, Hackney; lived in Great Queen-street (No.—?), Lincoln's Inn-fields; also in York-house, Strand, which was given to him by Cromwell.

Faithorne, William (d. 1691); engraver; lived at the sign of the "Ship" in the Strand, next to the "Drake," without Temple-bar; died in Printing House-square, Blackfriars, and was buried at St. Anne's, Blackfriars.

Falmouth, Lord; lived at No. 2, St James's-square.

Fane, Colonel (temp. George I.); one of the first inhabitants of Hanover-square.

Fanshawe, Sir Richard (b. 1608—d. 1666); lived in Boswell-court, Fleet-street; also on the north side of Lincoln's Inn-fields.

Farnaby, Thomas (d. 1647); schoolmaster; kept his school in Goldsmith's-alley, or Goldsmith's-rents, Cripplegate. He is described by Wood as the chief grammarian, rhetorician, poet, Latinist, and Grecian of his time. "His school was so much frequented, that more churchmen and statesmen issued thence than from any school taught by one man in England."

Ferguson, James (b. 1710—d. 1776); the astronomer; lived at No. 4, Bolt-court, Fleet-street, where he died. Buried at the churchyard of St. Marylebone.

Feverisham, Lewis de Duras, Earl of (b. 1709). He commanded King James the Second's troops at the battle of Sedgemoor. Lived in St. James's-square (No.—?), and was buried in St. Mary-le-Savoy.

Folkes, Richard (temp. Charles II.); lived in Newport-street (No.—?), Long-acre.

Fielding, Sir John (d. 1780); one of the originators of the Magdalen Hospital, St. George's-fields, and the Marine Society; lived in Bow-street (No.—?), and was buried at St. Luke's, Chelsea.

- Fielding, Henry (b. 1707 d.—1754); dramatist and novelist; lived in Bow-street (No.—?).
- Finetti, Sir John (circ. 1656); author of "Finetti Philoxenis—some Choice Observations touching the Reception, Precedence, &c., of Foreign Ambassadors in England;" lived in St. Martin's-lane (No.—?), Charing-cross.
- Fisher, Kitty; the celebrated courtizan; lived in Carington-street, May-fair (No.—?), about 1779.
- Fitz-Alwyn, Henry, first Lord Mayor, and mayor for upwards of 24 years, and a goldsmith of the guild; lived "in a very fair house" on the north side of the church of St. Swithin, London-stone, Cannon-street; he was commonly called Henry Fitz Alwyn of London-stone.
- Fitzroy, George, Duke of Northumberland (b. 1665—d. 1716); lived in St. James's-square.
- Flatman, Thomas (b. 1633—d. 1688); poet and miniature painter; lived and died in Three Leg-alley (No.—?), (now Pemberton-row), Fetter-lane; he was buried in St. Bride's, Fleet-street.
- Flaxman, John (b. 1755—d. 1826); sculptor; lived in New-street, Covent-garden (No.—?), from 1771 to 1772; from 1781 to 1787 at No. 27, Wardour-street, Oxford-street; and also at No. 7, Buckingham-street, Fitzroy-square, from 1796 to his death; buried in the burial-ground attached to St. Giles-in-the-fields.
- Fleetwood (temp. Queen Elizabeth); Recorder of London; lived in Bacon-house, off Cheapside.
- Fleetwood, Charles (b. 1692); Lord Deputy; lived in Wallingford-house; was Oliver Cromwell's son-in-law; buried in Bunhill-fields burial-ground.
- Florio, John, author of the well-known dictionary that bears his name; lived in Shoe-lane (No.—?), Fleet-street.
- Ford, Parson (b. 1731); died at the "Hummums," in Covent-garden, formerly a bagnio, now an hotel; it was really believed, for a long time, that his ghost appeared to a waiter in the cellar of this house.
- Foster, Mrs., Milton's grand-daughter; kept a chandler's shop in Pelham-street, Spitalfields.
- Foubert, Monsieur (circ. 1683); the riding-master; lived in Brewer-street, Golden-square, in 1683; Foubert-place derives its name from him; also, Foubert's-passage; young Count Köningsmark, so deeply implicated in the murder of Mr. Thynne, was a pupil in M. Foubert's academy in London.
- Fox, Charles James (b. 1749—d. 1806); the statesman; lived in Albemarle-street, "on the left hand a little way up as you go to St. James's-street;" also for a short time in Arlington-street; Godolphin House, in the stable-yard of St. James's Palace (pulled down to erect Stafford House), was his last London residence. He is buried, and has a monument to his memory, in Westminster Abbey.
- Fox, George (b. 1624—d. 1691), the founder of the Quakers; preached in a chapel up a narrow court opposite the old-fashioned gate leading to St. Edmund-the-Martyr. Died in the house of Henry Goldney, in Gracechurch-street (No.—?). He is buried in Bunhill-fields burial-ground, but no monument has been erected to his memory.
- Fox, Stephen, 2nd Lord Holland (1774); built and lived in the mansion in the centre of the Albany, Piccadilly, and sold it to the 1st Viscount Melbourne.
- Fox, Henry Richard Vassal, Lord Holland, (b. 1773—d. 1840), the famous Whig; lived at Holland House, Kensington. "He called on Lord Lansdowne a little before his death and showed him his epitaph of his own composing: Here lies Henry Vassal Fox, Lord Holland, &c., who was drowned while sitting in his elbow chair." He died at Holland House, in his elbow chair, of water in the chest. There is a monument to him in Westminster Abbey.
- Francis, Sir Philip (b. 1740—d. 1818); one of those to whom the letters of Junius were ascribed; was educated at St. Paul's School, and lived in 14, St. James's-square. Lady Francis lent this house to Queen Caroline, who lived here during the first proceedings of her trial.
- Franklin, Benjamin (b. 1706—d. 1790); printer, philosopher, and statesman. He worked in Palmer's printing office as a common journeyman printer, and assisted in setting the type for the second edition of "Woolaston's Religion of Nature," and "continued," he says, "at Palmer's nearly a year;" during this time he lodged in Little Britain, next to a bookseller of the name of Wilcox; he also lived at 7, Craven-street, Strand, and was employed as a journeyman printer at Watts' office, Lincoln's Inn-fields, in Duke-street, Lincoln's Inn-fields, opposite the Roman Catholic Chapel.
- Frederick, Sir John (d. 1757); his mansion was in Frederick-place (No.—?), Old Jewry, which derives its name from him. This house was used after his death, till 1768, as the London Excise Office.
- Fuller, Isaac (1672), painter, painted the sign of the Sun Tavern, behind the Royal Exchange. He was largely employed in painting the great taverns of London, particularly the "Mitre," in Fenchurch-street.
- Fuller, Thomas (b. 1608—d. 1661); author of "The Worthies;" lived in chambers in Sion College, London-wall while collecting materials for his "Church History;" his book is dated from here. He was also lecturer at the Savoy.
- Fuseli, Henry, R.A. (b. 1741—d. 1825); lived at No. 13, Berners-street, Oxford-street; also at No. 100, St. Martin's-lane, from 1784 to 1785; and at 72, Queen Anne-street East, Cavendish-square (now Foley-place), between 1788 and 1792. He was buried in St. Paul's Cathedral.
- Gainsborough, Thomas (b. 1727—d. 1788), the artist; lived in the western wing of Schomberg-house from 1777 to 1783.
- Galt, John (b. 1779—d. 1839), the novelist; lived at 54, Tavistock-place, Tavistock-square.
- Gardiner, Stephen, Bishop of Winchester (1555), lived at Winchester-house, Southwark, in great style, having a number of young gentlemen of family as pages, whose education he superintended. He used the Lady Chapel, at St. Saviour's, Southwark, as a consistorial court.
- Garraway, Thomas (circ. 1650); founder of Garraway's Coffee-house in Exchange-alley, and was the first who retailed tea in leaf and in drink, and may almost be considered the founder of the present system of tea-drinking.
- Garrick, David (b. 1710—d. 1779), actor; was living in 1745 in King-street, Covent-garden, in his lodgings at Mr. West's, cabinet-maker; also in Mansfield-street, Goodman's-fields-street, during the term of his first engagement in London; also in 27, Southampton-street, Strand, before he removed to No. 5, The Terrace, Adelphi, in 1772. In this house he died. He frequented the Bedford Coffee-house, under the Piazza in Covent-garden; and also St. James's Coffee-house, St. James's-street (no longer standing). He made his first appearance on a London stage in Goodman's-fields Theatre, as Richard III. He is buried, and a monument erected to his memory, in Westminster Abbey.
- Garth, Sir Samuel (b. 1665—d. 1718), author of the "Dispensary;" lived on the east side of the Haymarket, the sixth door from the top, from 1699 to 1703. He was one of the thirty-nine members of the Kit-Kat Club.
- Gascoigne, George (circ. 1637—d. 1577), poet; lived in Gray's Inn, where he was a student.
- Gay, John (b. 1688—d. 1732), poet; his "Beggars' Opera" was first produced at Lincoln's Inn-fields, and played 62 nights in one season. He was buried, and a monument erected to his memory, in Westminster Abbey.
- George, Prince of Denmark (b. 1653—d. 1708), Queen

- Anne's husband; was Lord High Admiral from 1702 to 1708, one of the exceptions to the rule that this office has been held in commission since the Revolution of 1688. He was married in St. James's Chapel, St. James's Palace, and died in Kensington Palace.
- Gerard, Charles, Lord, afterwards Earl of Macclesfield (d. 1694), lived in Gerard-street (No.—?), Soho; also in Newport-street (No.—?), Long Acre.
- Gerarde, John (b. 1645—d. 1607), the herbalist; lived in Holborn; used to collect specimens, particularly water violets, in St. George's-fields, also in Mile-end, Whitechapel. He makes the earliest mention of Piccadilly.
- Gibbon, Edward (b. 1737—d. 1794), the historian. He was educated at Westminster School; was a member at Almaack's Club; afterwards M.P. for Liskeard; lived in No. 7, Bentinck-street, Manchester-square, where he wrote a large portion of "The Decline and Fall of the Roman Empire," and the whole of his Defence of his noble history. He also resided at No. 76, the corner of Little St. James'-street, where he died. This spot is now part of the site of the Conservative Club.
- Gibbons, Grinling (b. 1648—d. 1721), carver in wood; was born, it is said, in Craven-street, Strand, then called Spur-alley, but this is very doubtful. He lived in Belle Sauvage-court (No.—?), Ludgate-hill, and also in a house about the middle and east side of Bow-street, Covent Garden, where he died. This house was distinguished by the sign of "The King's Arms." He lies buried in St. Paul's, Covent Garden.
- Gifford, William (b. 1755—d. 1826), editor of "Ben Johnson" and the "Quarterly Review," and author of the "Baviad and Maviad," &c.; lived and died at No. 6, James'-street, Buckingham-gate. At the shop of Wright, the bookseller, in Piccadilly, Gifford assaulted Peter Pindar, and got the better of him in the struggle. He lies buried in Westminster Abbey.
- Gilliver, Lawton, bookseller; lived at "Homer's Head," against St. Dunstan's Church, Fleet-street.
- Gloucester, H.R.H. Wm. Henry, Duke of (b. 1743—d. 1805); lived in Gloucester-house (now Grosvenor-house), Upper Grosvenor-street, Grosvenor-square; also in Leicester-house, Leicester-square, in 1766.
- Glover, Richard (b. 1712—d. 1785), author of "Leonidas," an epic poem; lived at 11, James'-street, Buckingham-gate; also on Lawrence Poultney-hill, Cannon-street, City, and at Albemarle-street, Piccadilly, where he died.
- Godfrey, Colonel Charles, lived in Great Windmill-street, Piccadilly.
- Godfrey, Sir Edmundsbury (b. 1678), the famous Protestant martyr; lived in Green's-lane (No.—?), Strand. He was a wood merchant here, and had his wharf at the bottom of Hartshorne-street, Charing-cross, now called Northumberland-street. He is said to have been murdered at Somerset-house, Oct. 17th, 1778, and his body taken and thrown into a ditch near Primrose-hill. There is a monument to him in Westminster Abbey.
- Godwin, Mary Wolstoncraft (b. 1759—d. 1797), authoress of the "Vindication of the Rights of Women." She was the first wife of William Godwin, and mother of Mrs. Shelley. She lived at the "Polygon," Somers's Town, where she died, and lies buried at St. Pancras-in-the-Fields.
- Godwin, William (b. 1751—d. 1836), author of "Caleb Williams"; lived at the "Polygon," Somers's Town, which is now surrounded by Clarendon-square. He kept a bookseller's shop for several years, at 41, Skinner-street, Holborn, and lies buried with his two wives at St. Pancras-in-the-Fields.
- cently in the Court House (kindly lent by the justices of the North Riding), which was crowded in every part. The chair was taken by Lord Teignmouth. From the report it appears that the Institution is in every respect flourishing.—The Chairman, after directing attention to the work carried on in the Institution, spoke in strong terms of the evil effects of combination among the working classes; but, so great was his confidence in the loyalty of Englishmen, he doubted not working men would soon emancipate themselves from the intrigues of evil disposed ringleaders.—Mr. Henry H. Sales, while agreeing with the remarks of the chairman, pointed out the coldness and want of sympathy for workmen too often manifested by employers, who forgot that capital and labour had other duties besides the payment and receipt of the weekly wage.—Dr. Walton, jun., commended the social features of the Institution to the non-members present.—Other gentlemen having spoken, the proceedings, which had been enlivened by the excellent singing of the local choral society, were brought to a close. *Seacroft Working Men's Institute.*—A meeting of the inhabitants of Seacroft was held in the parish school-room, on Thursday, October 10th, to take into consideration the establishment of an Institute in the village. The Rev. H. J. Lorysdon, M.A., occupied the chair. After much discussion, it was unanimously resolved that the establishment of an Institute, with a reading-room, library, and lectures, was desirable, and would meet with good support. The Chairman then called upon Mr. Henry H. Sales to specify the best mode of action. A committee was afterwards appointed to canvass the village for members, and to immediately commence a Working Men's Institute, the name being chosen in preference to the usual name, Mechanics' Institute, inasmuch as but few mechanics are resident in the district. *Hebden Bridge Mechanics' Institute.*—The annual *soirée* and distribution of prizes and certificates took place on Saturday evening, in Messrs. Crossley's mill, kindly lent for the occasion. The chair was taken by the president, H. Horsfall, Esq. The annual report was of a satisfactory character, the number of members being 152 in 1866, against 138 in 1865. The classes were in an efficient state, due, in the opinion of the committee, in no small degree to the valuable scheme of examinations of the Society of Arts and the West Riding Educational Board. The Rev. J. B. Lockwood, the Rev. T. Wilkes, Mr. Sales, and other gentlemen, addressed the meeting, which was very numerous, attended by factory operatives. Songs, glees, and recitations, together with instrumental music, made the gathering pass off most successfully.

MUSICAL EDUCATION.

At the Church Congress lately held at Wolverhampton, the Rev. Sir F. G. Ouseley and the Rev. Thos. Helmore read papers on the subject of Church Music. A report of them was published in the *Wolverhampton Chronicle*, as follows:—

THE MUSICAL TRAINING OF THE CLERGY.

The Rev. Sir F. Ouseley read a paper on this subject. He began by saying that he hoped the subject on which he was going to address them would prove one of sufficient intrinsic interest in itself to secure their attention. That great improvement had been effected in Church music during the past twenty years, was now a matter of common notoriety. Many causes had contributed to this. In part it had been caused by the increased knowledge and hearty appreciation by the people generally of what was good in it, and by what had been more particularly the growth of our time, and had shown itself all over the kingdom, the formation of choral associations, the holding of large concerts, and the great increase of singers amongst all classes. In part, too, it was owing to the improved state of education generally; and, in part, too, to the system which had of late years sprung up of special choral teaching. And he would here take the opportunity of

Proceedings of Institutions.

YORKSHIRE UNION.—*Northallerton Mechanics' Institution.*—The annual *soirée* of this Institution was held re-

naming Mr. John Hullah, to whom the revival of our national music was mainly due. But there was a still higher cause than any of those he had mentioned which had led to the improvement of which he spoke, for it was improvement not merely of singing only, but of a heartiness in singing. A great deal was also due to the energy and zeal with which the clergy themselves had entered into that work, and it was to the parochial clergy that they must chiefly look for the carrying out of all improvements in the choral services of their parish churches. Sir F. Ouseley then went on to show that the practice of singing in connection with religious services had been handed down to us from the earliest times; for instance, our blessed Lord joined in the singing of hymns with his Apostles, and we were exhorted so to do in the Apocrypha, where the harpers were harping with their harps. Under these circumstances he might take it for granted that it was most desirable to improve our church music, but the question arose what ought to be sung, and the way of singing it. Clergymen were the natural leaders of church psalmody, and this should go hand in hand with the professional leader which it would be necessary to engage. There was, unfortunately, a great want of musical learning in candidates for holy orders, and in some persons there was a natural incapacity and a deficient ear for music, which no amount of training would ever supply. He was the last to say that the person in which such deficiency existed should be precluded from entering holy orders, for there were many other offices which he could perform, namely, preaching and visiting the sick, but under such circumstances the leading of the choir should be left to a more competent person, who should be carefully appointed. The rev. gentleman then went on to say, upon the authority of Mr. Hullah, that there were very few who were incapable of musical training, and then came the question how could this be brought into being. To this he would reply that more attention should be given to musical training in our schools. It was true that great improvement had been made in this respect in schools, but still the musical element among the humbler and poorer classes might be developed further with considerable advantage. It fell to his lot to examine the papers of the candidates for the middle class examinations, and in musical efficiency the average was low, and he was instructed to put the most elementary questions. He then proceeded to observe that in cases of cathedral choirs the youths should be trained by some college tutor, but not brought up to spend the remainder of their hours in idleness, and allowed to run the streets, thereby growing up, perhaps, efficient musical scholars, but devoid of those Christian principles which it was so essential should go hand in hand with knowledge. He also argued that the musical training should be more general in our universities, in order that clergymen might be better able to control, and take part in the services in our country churches with musical ability. The rev. gentleman concluded by throwing out the suggestion that music should form part of the examination for deacon's orders, not as a matter of necessity, but as an alternative subject; and concluded his paper amidst expressions of applause.

CHURCH MUSIC.

The Rev. T. HELMORE next read an interesting paper on the subject of "Church Music," with musical illustrations by the choir of Lichfield Cathedral, with harmonium accompaniments. The reverend gentleman, after alluding to singing as a means of praise, and of following out the scriptural injunction to show our gratitude to and adoration of God, next referred to the carelessness evinced by many with regard to the proper cultivation of singing. In social life, although there was expressed liking for music, it was too often performed in an indifferent manner, to suit the carelessness of indifferent people. Music and singing had larger claims upon our attention, than for the mere purpose of

contributing to our amusement; they were a means by which we could praise and glorify God. For this purpose it was essentially necessary that both the clergy and the people should learn to sing, and should properly cultivate whatever talent for singing they might possess. They could not expect to hear good congregational music whilst there was not a man amongst them who could use his voice musically as a singer. He did not speak so much of females, because, as a rule, they could always sing better than men, perhaps from having greater facilities for it, greater sympathy, and more frequent opportunities of singing. He then advocated, at some length, the formation of singing classes in all our public schools, the extension of the system of choral teaching, and also the adoption of full choral services in all our parish churches, so as to increase the devotional feeling of the people, instead of confining such services, as had been the case hitherto, to our cathedrals.

ON RAILWAY REFORM IN CONNECTION WITH A CHEAP TELEGRAPHIC POST AND A PARCEL POST DELIVERY.*

By EDWIN CHADWICK, Esq., C.B., CORRESPONDENT OF THE INSTITUT OF FRANCE.

In an address which I gave before this Association in London, when I had the honour to fill the office of president of the department of economy and trade, and also in a paper which, by request, I read before the Society of Arts,† I submitted my views on the economical principles applicable to the reform of our railway communications. I endeavoured to show that railroads, like common roads, were usually profitable, often by the increased value given by them to adjacent land, though they failed to pay good dividends—as good common roads are usually profitable, though they may fail to pay for their construction and maintenance by tolls. I contended that all taxes on the means of intercommunication—that all exactions on them beyond the payments for construction and the services of working and maintenance, are wasteful, and among the worst of taxes. I maintained that, by the substitution of public or governmental for the private trader's security—by the economies derivable from unity of management, and by the relief from local as well as from general taxation, obtainable by putting the railways in their proper position as public roads—a large saving may be effected, sufficient to compensate the shareholders fairly, and to provide for reduction of fares and extended accommodation to the public.

On the motion of Sir John Pakington, that address was published, and I believe it served to promote the appointment of a commission of inquiry into the facts. That commission has recently made its report. By more impartial persons than I may pretend to be, that report is pronounced to be a failure. It has failed to meet the elementary propositions to which I have referred, or to elucidate them properly. It reports as its opinion "that it is inexpedient, at present, to subvert the policy which has hitherto been adopted of leaving the construction and management of railways to the free enterprise of the people"—meaning by the people, it is fair to presume, such private enterprisers as those who, by multiplied competing capitals wastefully applied, have brought our railways into the existing ruinous condition, by whose blunderings (not to speak of any plundering) a state of complicated evil has been produced, from which it is, "at present," needful to extricate it—for the avoidance of further waste and for the sake of the free enterprise of the people—meaning the whole people—in safe, convenient, cheap, and complete intercommunication. Lord Stanley has not signed the report. Neither has Mr. Roebuck signed it. Mr. Monsell has made a distinct and very

able report, especially on the railways of Ireland, and in opposition to the report of the majority of the commissioners. And, above all, Sir Rowland Hill has made an independent report, well sustained by evidence, on the whole question, very much in accordance with the views which I submitted to the Association.

We were led to expect a paper on the subject from Mr. Lloyd (the author of the celebrated Lloyd's bonds), who, upon Sir Rowland Hill's report, has stated that he has arrived at conclusions in the direction of those set forth therein, and was desirous to avail himself of some opportunity of expressing them publicly. I regret that he has been prevented giving us the benefit of the results of his very long and close experience for this meeting. From several persons practically engaged in large branches of railway administration I have received, privately, direct expressions of concurrence in the views I have set forth.

I now wish to direct attention to the present position of the question, and to some points specially applicable to it in Ireland, that have not, as I conceive, received the prominent position due to them. Before doing so, I must beg leave to make some observations on the Commission itself. I confess that I was somewhat surprised at its composition, in which the mistake appears to have been made, of assuming that the interests of railway directors and others, who have profited largely by the existing system, and who constitute the majority of the members of the Commission, were identical with the interests of the ordinary shareholders, who, as a class, have lost or been ruined by their management. It is a doctrine of Locke that in entering upon any question we should consider the state of our interests in respect to it. If I had made a fortune by the system in question, or belonged to a house which had received large sums on account of it, or had derived greatly augmented values of lands from it—if I owed my public position to it—if, indeed, I were a member of Parliament, responsible for the system by long acquaintance with it—I should have felt that my proper position would be that of a witness, or of an advocate, rather than of a judge upon the system. Immediately the composition of the Commission generally was seen, the directorates and private enterprisers were at their ease upon it, and their confidence was early confirmed by the course of its investigations.

So great a subject can only be dealt with satisfactorily by undivided attention, and by local investigations, and where the Commissioners are themselves unable to give it, that attention must be given for them by competent assistant Commissioners. It was due to the manufacturing interests in the great centres of industry, that complaints should be heard locally, and that the shareholders, as well as the public, should be locally informed, by proceedings on the spot, as represented by the Mayor of Dublin, and this has not been done.

There are no after-criticisms, for I remonstrated to the Commissioners themselves on the imperfection and unsatisfactory nature of their inquiries, amongst other things, in not inquiring closely into the gains derivable from unity of management;—in not examining closely, or at all, the important examples cited of cases where, under competition, extreme reductions in fares had been made good, or nearly so, by increased traffic, so as to determine what must have been the net result from the increased traffic, if it had occurred, as it might have done, under unity of management;—in not inquiring closely into the increased value of land created by the formation of railways, and justifying contributions from the land;—and in taking mere hearsay evidence, and not making direct inquiries into the governmental or public administration of railways on the Continent, which Mr. Robert Stephenson, Mr. Locke, and other witnesses, practically conversant with them, had cited as examples to be followed.

The report of the commissioners, in depreciation of those examples of the foreign railways compared with

those of England, parades the greater numbers of the English trains; omitting to notice how many of these are duplicate, and even triplicate, competing trains starting from the same points to the same points, at nearly the same times, with carriages habitually only one-half, or even one-third, full;—as on the line between Manchester and London—three capitals, for the performance of a service that might, under proper management, be better performed by one; involving, as has been shown in relation to that one line, a waste of some quarter-of-a million annually, in mileage alone. We impeached the present system for waste. The Commissioners appear to have seen no significance in such large confirmatory facts and testimony as the following of Mr. C. E. Stewart, for twenty years secretary of the London and North Western Company, who, lamenting the losses by disunion, states, by way of illustration as to one of the three companies, that "The number of passengers booked during two days from the Euston Station, on the 12th and the 13th of September, 1861—which I believe may be taken as an average—was 4,482, and for the accommodation of those passengers there were sent away trains containing seats for 13,512 passengers." Then with regard to the up traffic on those two days, "4,336 passengers arrived at the Euston, and there were seats for 13,333 passengers!" Then as to goods, he says, "The general managers will tell you that very often a waggon is sent off with a quarter of a ton, which is capable of carrying four or five tons; I believe the general average which is sent off in a waggon is not more than one and a half to one and three quarter tons." On such facts he estimates the saving derivable from unity of management if the companies "would only work harmoniously." At present, as the director of one of the largest companies declared to me, half their time is consumed by hostilities with each other.

The state of information of the commissioners on the general condition of the subject matter of their inquiry is indicated by the following questions from two of the commissioners—railway directors (put in April, 1866)—to another railway director, late a director of the Great Eastern Company.

"*Chairman (to Mr. Bidder)*—Are there any railway companies in England which are not able to pay their guaranteed preference stock?

"*Mr. Bidder*—They must be very small indeed.

"*Mr. Glyn*—Are there any instances of that sort at all?

"*Mr. Bidder*—I do not know of any. If there are, they must be very small indeed."

I might fill a volume with illustrations of their course of inquiry; especially of questions assuming as facts fallacies and interest-begotten prejudices; the answers to which would require the exposition of a system. I may, however, give one illustrative example, though that was of a commissioner who is not, that I am aware of, under any sinister interest in relation to the companies.

Mr. Galt had proposed that the reformed railways should be given over for working to the best bidders as responsible contracting companies.

7548. "*Mr. Lowe*—Do you not think that a company which had the power of sending several members to Parliament would be dealt with more leniently by the Government on whose side it returned members than a company which used its power the other way?

"*Mr. Galt*—If you give no option, if you make it binding, that you shall let the contract to whosoever gives the most money, there is no option left in the power of Government.

"*Mr. Lowe*—When you have once got the company, supposing the company is letting the permanent way go out of repair, would it not be dealt with more leniently by the Government if it supported the Government for the time being, than if went against it?

"*Mr. Galt*—If the Government break faith with the public, and act dishonestly, you can only go to Parlia-

ment for redress; you cannot provide against those things.

"*Mr. Lowe*—You cannot provide against the Government using its power for political purposes?

"*Mr. Galt*—If the Government chooses to act dishonestly, then all the power of the Parliament would be used to remedy that state of things.

"*Mr. Lowe*—Do you not think that a very good reason for not adopting the system you propose?

"*Mr. Galt*—I do not think so."

And so the examination goes on with a persistent assumption of an incurably rotten state of corruption on the part of the Government, and its impotency for the needed reform.

I beg to observe on the theories and facts assumed in these questions: First, that the administration of the railway directorates is generally unexceptionally pure and superior; in the next place that governmental administration under the existing constitution is generally inferior and thoroughly corrupt; that its corruption is an ultimate fact, which it passes any (his) legislative skill to remedy. That this is not an incorrect interpretation of the right hon. gentleman's meaning, may be inferred from the fact that he has said much the same before, when, as Vice-President of the Privy Council, he rejected the proposal of the Education Commissioners for giving power to the Privy Council to reform educational endowments, and rejected it on the ground that in its exercise such a power must be politically jobbed; and again recently, when he declared himself for the purchase system, on the ground that "promotion by merit" must needs be, in this country—disregarding the fact that it is not so in France or in Prussia—"promotion by job." My answer on the legislative problem, of securities against jobbing in contracts, was by referring to those taken for supplies to the French army, from it being there, as I am assured, very completely resolved, that it is resolvable here. I must, however, repeat my denial of the fact assumed of the relative inferiority and greater actual corruption of governmental administration.

Now and then, and at long intervals, there has indeed been a cloud of suspicion upon a member of Parliament, a party man who has got into a changing political office; and there have been clouds upon inferior executive officers whose duty was to pass goods, and who were seen to live beyond their salaries or ostensible means. But of the chief permanent executive officers of departments, I never knew or heard of one who lived beyond his modest salary or his ostensible private means; and I do not believe that a purer set of officers will be found in Europe. Admitting that improved securities are needed in taking contracts, I believe I shall be warranted in the allegation that there is a very large amount of public expenditure on contracts in which no reasonable suspicion attaches, to which no fair objection can be made. But only think of a privy councillor repeating such pregnant innuendoes against the executive government of the country—imputing to it inferiority and less trustworthiness than the general railway administration, in which the instances are notorious of officers leaving depressed and ruined railways with immense fortunes! I beg to recal to recollection my declaration of my belief that no government of any party in this country could have existed under such gigantic mismanagement as has been displayed in the railway administration, in the courts of law, and in public investigations. Since then I am sorry to have beheld one vast verification after another of that declaration, in immense disasters, which have disgraced the country before Europe, and have shaken commercial credit everywhere and carried ruin into the families of the poor shareholders throughout the empire, who had been led by directorates to invest their savings in shares, which they were assured were as secure as the public funds. If what the right hon. gentleman says be true—if the Government be so corrupt that it can

not be entrusted to make contracts for the public—if it be impotent to do what is requisite for the economy, freedom, and safety of the means of internal communication—to do what is done by other constitutional governments, and even by some despotic states on the Continent, it is surely a Government which, if it be not to be reformed, will not, in a social science point of view, be deemed quite deserving of his magniloquent glorification of it as an example of the perfection of legislative wisdom! Whilst progress is making in the physical sciences—under such political pessimism as the declarations cited imply, there can be no material progress in the science of legislation, or in public administration in this country.

Nevertheless, the inquiry has served to prove that the pecuniary gain to be derivable from unity of administration is very considerable. By the one practical and reliable witness, whose testimony I have cited, it is rated at twenty per cent. It is, moreover, clear that there is a large saving available on all debentures and debts, as put by Mr. Galt, of the difference in value, amounting to about one-fourth, from the substitution of private for public security. Thanks to Mr. Galt, to Mr. Monsell, and the public authorities of Ireland, the evidence has been made clear (and impartial persons would say decisive), for the resumption of the public rights and the recomposition of the governmental responsibilities in respect to the railways. Of the reductions obtainable by unity of management, as well as by the financial operations, there can be no reasonable doubt. Assuming it to be agreed that the reductions are to be made, the question is how the saving by them may be most equitably divided between the public and the railway shareholders. Here in Ireland, giving to those shareholders something who now receive nothing, and who have no reasonable prospect of receiving anything within a generation;—giving them what not directors but arbitrators in their interest would advise them to accept; giving for the railway property of Ireland, which, on a liberal estimate, is commercially valued at seventeen millions and three quarters, nineteen millions and a-half; the government or the public, borrowing money at $3\frac{1}{4}$ per cent., would get that property for £634,560 per annum, which now yields a net annual profit of £900,592; making a gain of £266,032; added to which £120,000 is to be saved by unity of management—presenting a prospect of some total saving of £386,032 to compensate for the risks of considerable reductions of fares for passengers and rates for goods. Added to these estimated pecuniary savings, are very considerable savings in time by better fitting trains, a saving in cross districts in England estimated at one-third, without any alterations of rates of locomotive speeds. Railway shareholders in England may calculate for themselves the gains derivable from the like operation for their properties, and add to them a gain of about six and a-half per cent., by the reduction of local rates and public taxes, by placing the railways in their proper position as public highways. The government have taken the important step to ascertain, by a second commission for Ireland, what,—if the first commission had been impartially and competently directed, would have been in course of being determined for Great Britain,—namely, the exact financial condition of the railways, their actual receipts and expenditure for the last three years, and the present condition of the lines and the rolling stock, with a view to ascertain their actual value for a purchase.

I now beg leave to direct attention to two additional elements of utility and value, derivable from the course I have proposed,—especially with respect to Ireland.

In relation to a country in the condition of Ireland, chiefly agricultural, I would submit, as an administrative principle, that the extension of the means of communication and the improvement of the conveniences of transit should not be delayed for demand, but should precede demand; and if the operations be conducted

judiciously and economically, they will invite and stimulate use and create demand. In parts of Scotland and in England, where railways have been constructed from one distant point to another, through thinly-populated districts, without regard to intermediate traffic, or any expectation of it from those districts,—in such conditions the projectors have been sometimes vastly surprised by an amount of traffic exceeding the traffic estimates for the formation of the lines,—that has appeared to be extraordinary and unaccountable to them. Extraordinary augmentations have also occurred, surprising to railway managers, on the occasion of the extension of conveniences by reductions of fares.

But the greatest extensions of conveniences will be in the formation of branch lines, and I should anticipate, as in the United States of America, by the construction of light and cheap horse-railways. In and about American cities the extent of horse-railway appears to be about equal to railway for locomotives. These horse-railways are made with lighter rails, and at a comparatively cheap rate. If such railways, which give to one horse the power of more than three, be an economy within advanced farms or advanced manufactories, they will be an economy to carry produce from them to stations, as well as to markets. With due extensions, besides much new traffic created, much existing agricultural and other traffic will be gathered to the railways that now goes by cart or waggon. It is probable that the full extension of these branch lines would early equal in extent the main lines now in action.

Now the present condition of the railways, in the hands of private commercial companies, operates as a barrier to these most important and economical extensions throughout the country. In the first place, the companies' habits of expense are detrimental to such cheap extensions. Their extensions are made with the like weights of rails as their main lines, and much on the same scale in other respects. The companies, as private traders for a profit, are moreover subjected to exactions for land which could not be attempted if the branch lines were put, as they ought to be, on the footing of local bye-ways, and as a service without private profit. On looking over the maps, it will be perceived that branch lines are required for much country intermediate between the existing lines, under conditions in which they will appear to be, and may be made to be, auxiliary competing lines for one main line or the other, and therefore their construction is at present subjected to every sort of expensive obstruction.

On the whole, branch extensions, under the existing conditions of the railways, have generally proved to be a system of suckers on the trunk lines; whilst, if the public rights be resumed, and proper governmental duties be restored, and if the railways be put on their correct footing, as public highways, and the branches as local bye-ways, with available economies of construction and working, the whole system of branches may be made a great system of feeders.

The resumption of the public rights, and of the governmental duties in their behalf over the means of communication, would be of great importance, especially for Ireland, by removing obstructions to the utilisation of the postal establishments, and serving for the distribution of parcels and postal messages, as in Belgium and Switzerland.

In an administrative point of view, the postal service is intimately, indeed, essentially, connected with the railway service, and, in my view, which I think is impartial, ought to be predominant in it. The union of the postal service with the railway service would be a powerful means of regulating the punctuality of the railway trains, besides furnishing the means of collecting and distributing parcels, as well as telegraphic messages. As it is, the railway companies' mail-trains are generally the most punctual, and on that account are the most resorted to by business men; and they are made punctual by the governmental service of

the post, which "fetches them up," and fines them for delay. But, as I showed in a paper read at the Society of Arts some time ago, on a parcel post system, that our post has more than ten thousand stations, and now a force of more than twenty-five thousand persons for the performance of the public service. All the railway stations put together are, I believe, not above one-third of the number of the postal stations. The telegraph companies, as I have shown, have not more than about one telegraph station to every eight or nine of the post-office stations. The power of the distribution of small parcels and of telegraphic messages by the postal service may be said to be about eight or nine to one of the trading companies power. If a small parcel be required to be sent a mile or two from the railway station by the railway company, usually a railway porter must be sent with it, and the time of that porter must be charged on the one small parcel; though it may be but an ounce or two in weight. But on the system of postal distribution, it would form but a small addition to the handful of letters he has to carry. If the parcels were heavy or more numerous, they would be collected or distributed by the post-cart. I had to examine the subject with reference to postal telegraphy, for a paper prepared to submit to Mr. Gladstone on the question, when it was manifest that under the existing conditions, the companies could not extend their stations, with a fair prospect of profit, beyond their existing numbers; and for this reason, that the companies must have separate office rents, coals, candles, taxes, office-keeper, and messengers, for comparatively few messages, which will not pay the extra expense. The rent, and other expenses of the stations, as well as the services of the post station masters, are already paid for, and they would be compensated for the occasional additional service by a relatively small, but acceptable addition to their existing pay.

In the case of postal telegraphic messages, in a large proportion of cases, in rural districts, the postal service would, as I must remind you, reduce the distance and the time of delivery of the message by post messenger to one eighth or ninth of the labour and expense to which the private companies are now put. Thence it follows that by the utilisation of postal stations and services on a public footing, collections and distributions may be effected at low rates, quickly, and with a profit, which private companies, with their separate establishments, cannot effect at the same rates, nor, indeed, at much higher rates except at a loss.

In London, and in most places in England, to get a letter, and a telegraphic message sent, and a small parcel forwarded, application must be made at three different and commonly distant places. In Switzerland or Belgium, and other places on the Continent, you only go to one place, the postal station, which, in itself, is a great convenience and saving of time, especially when the tariffs are all well known. In Belgium, the uniform telegraph message has been reduced to half a franc, and the revenue has been replaced by it. In both countries the charge for the transmission of small parcels is very small. In Switzerland parcels of 120lbs. weight may be sent by post.

I may here state that the Belgian government, appreciating the importance of the cheapest and freest means of inter-communication, though their fares were of the lowest in Europe, have recently reduced them considerably lower. Their first-class trains, which were about three half-pence per mile for the express trains, they have reduced to less than three farthings, and their second-class to less than a half-penny. Thus the express fares from Brussels to Verviers, which is 86 miles, are—for the first-class 4s. 9d., for the second-class 3s. 2d.; whilst for the ordinary trains the fares are—for the first-class, 4s., the second, 3s., and the third, 2s. In England, the fares for express trains range from two pence half-penny to threepence per mile, and the second-class from three half-pence to twopence. As to the ordinary fares, take those here at Belfast. Take those

from Belfast to Carrickhugh, which is 82 miles—they are, first-class, 14s. 3d.; second-class, 10s. 4d.; third-class, 6s. 6d. Take an English line, for example, that from London to Rugby, which is 82½ miles; the fares are—first class, 15s.; second, 11s.; third, 6s. 10d. On the Belgian lines they charge extra for such luggage as the passenger cannot carry and put under the seat, which occasionally may make some slight difference in favour of the English lines, and in Belgium return tickets are less frequently granted. But what will all that come to? The time has been unfortunate for the change, as Belgium has partaken of the commercial stagnation prevalent in Europe, but the net revenue is in course of replacement from the bold and highly politic reduction, which, looking at the analogies of the population of the two countries, I regard as an encouraging example for Ireland.

The result of the utilisation of the public stations and the postal service in Belgium and Switzerland has been a considerable augmentation of traffic. In a few years the transmission of small parcels by post has been nearly doubled, and I believe now they are at an increasing rate of nearly five millions annually in Switzerland. In Ireland the number should be in the same proportion more than doubled, and the branch lines made more largely feeders to the main lines.

The effect of this system on trade in Ireland would be, as it has been in Switzerland, very powerful. It would enable traders to send for goods as they want them, and to diminish the expense of stocks. In Ireland, as in Switzerland, it would enable business to be transacted often with one-third the stocks that were heretofore found necessary.

In Ireland, however, I apprehend that the stocks in the village shops and the retail shops in general are, from poverty, very low. With them the results of cheap parcel post conveyance, and of a cheap postal telegraph, would be the reverse of that in Switzerland or Belgium. It would be to give them, in effect, indefinite augmentations of stock, by enabling them to send for goods fresh, and as they wanted them. It would also tend frequently to bring the producer directly in communication with the consumer, and to save the cost of intermediate agents. In several of the continental states there are large beneficial results in progress in these directions, which here in Ireland, as well as in England, are arrested—I say, unavoidably arrested—by the condition of railway communication in the hands of disjointed and conflicting companies.

The railway commissioners could not well avoid noticing the complaints made of the uncertain and conflicting rates and the imperfect delivery of parcels, and they say:—"Looking at the extent to which the railway system has now reached, the time has arrived when railway companies should combine to devise some rapid and efficient system for the delivery of parcels." They might have added the word "economical" delivery, and also some rapid and efficient system for the collection of parcels.

When I represented the great extent of the ground for which new branch railways were needed, and of the capillaries of the system of internal communication which required to be improved, speeded, and utilised, I did so from impressions derived from passing observation. But the distinct statistical evidence of the extent of the postal system of deliveries, or of those capillaries which they advise the railway companies to rival, was put before the commissioners, by the evidence of Mr. Page, from the post-office, and it is this: The number of miles which mails are conveyed daily by railway in the United Kingdom is 49,700, and, beyond these, the number of miles which mails are conveyed daily, by coaches, mail-carts, and omnibuses, is yet 33,000, whilst the number of miles travelled by the rural post messengers is 72,000 miles daily, or nearly as much as all the mileage of railways and mail coaches put together. Could the commissioners have minded these facts, or have heeded what they were proposing, when they proposed that the

railway companies should undertake the delivery of parcels—impliedly as equivalent to the plan proposed of a postal delivery—i.e., that the railway companies should undertake the separate service of parcel delivery by separate means, equivalent to this thirty-three thousand miles of postal delivery, by coach or mail carts daily, or the daily postal delivery of seventy-two thousand miles by foot, to be provided and paid for separately? Is Ireland, however, it stands thus, and I adduce the fact for particular attention; whilst the daily conveyance, by mail coaches, carts, &c., is 8,277 miles, and by foot messengers 8,680 miles daily, by railway, according to the last returns, it was only 4,645 miles daily. That is to say, they were recommending to the existing companies the formation of a triple number of stations for collecting and delivering parcels, multiplied offices and services, clerks, &c., as well as carts—an extra expense for them which must, if charged on the parcels, to a great extent be prohibitory.

In Ireland there are sixteen hundred and more postal stations. I have not at hand the number of railway stations. But, as some electric telegraph company directors maintain the same doctrines against the utilisation of public establishments for the public service, is exemplification of its fallacy, I may mention that, while there are 1,625 postal stations, there are only 92 telegraphic stations in Ireland. In other words, the telegraph stations are to the postal stations in Ireland as one to seventeen. If the public are determined to utilise their postal establishments, as I trust they will be, the trading companies must, in Ireland, have sixteen more separate establishments to compete with them—a supposition that is absurd. Are, then, the sixteen places, sixteen towns or villages out of seventeen to be deprived of the benefit of quick and cheap intercommunication by message, that the monopoly of a trading company, and its power of making exactions on their necessities, may be maintained?—a supposition that, as a question of legislation and administration, is also absurd.

In Ireland, where, on the principle I have stated, conveniences ought to be in advance of demand, the proportion of post-offices to the population, which ought to be the same, is less than in England. The combination of the postal with the railway and the telegraphic services may serve to make them equal at reduced cost. In Ireland there is only one postal station to some 3,700 of the population. It is stated to be part of the post-office plan to extend postal telegraphy only to places having a population of 5,000 persons. This can only be accepted as, in the first instance, a tentative extension. In Prussia, which is in many respects the best administered country in Europe, in which the government well knows what it is about, it has been officially announced that the government intends to extend the telegraphic system to every place with a population of 1,500 persons, or nearly double the extent of our postal stations.

On the public footing there are other large branches of service for which the telegraph is needed, and which should contribute to the establishment charges, in reduction of those for the telegraphic post.

As a commissioner of inquiry into the organization of a police force, I can state that by a complete system of telegraphic communication from station to station, and in combination with a general postal system, the efficiency of the police force may be nearly doubled. If I recollect rightly there are upwards of 1,300 police stations in Ireland. Then there are the coast-guard stations, and the Royal and mercantile marine stations, and all the military stations, which need connection; and all these will bring telegraphic communication closer than the existing telegraphic stations. The statement made by the Minister of War for Belgium declared that placing the railway under public control had doubled the efficiency of the army, and that the electric telegraph would double it again, and this, I submit, especially applicable to Ireland. I am assured, upon good authority, that by a recent invention by Mr. Donald Nicoll, underground

may be laid down and maintained as cheaply as the present system of overground telegraphs.

As to the utilisation of the public establishment for the public service by postal telegraphy, is there any opposition to the utilisation of the establishment for the distribution of parcels, and to the use of the public highways for railway communication, and the unity of public management as a service. I notice some of the grounds put forward in opposition to postal telegraphy.

In a paper which I read at the Society of Arts, I noticed that "Under the existing conditions of dearth, the great incompleteness in England, the telegraph is said to be a mere cable telegraph, and is used only for stock brokers, produce, and the higher classes of professional men. It is not to be called a domestic or a general public telegraph. For domestic use it is generally only available to the very well-to-do classes—the few. For the middle classes its use is confined chiefly to extraordinary occasions, to death, to mortal sickness, or to great calamities. So much is this so even amongst families, that at first a telegraphic message often before the message is read, a shock of alarm, that great sadness has happened, and is to be communicated. And, to the lower middle classes in towns, to the lower classes in towns, as also to the agricultural classes, the present charges may be said to be entirely excessive."

In the course of an answer to my paper made by Mr. G. S. Grimston, the chairman of the International Telegraph Company, he thus states the limits of the present use of the telegraph, as a ground for doubting the amount of the telegraph obtainable from its extended use as part of a postal system, and he states, as a proof of his opinion, "that the gross receipts of the Electric Telegraph Company, in the year 1866, amounted to £717s. 9d., of which 75 per cent. was taken at 10s. 2d. per cent. at 77 stations, and 3 per cent. remaining 1,157 stations." As a further proof he says, "I may add that half the money taken at the 15 stations was received in London, a quarter in Liverpool, Manchester, and the remainder at 12 other towns." And hence he assumes that telegraph service is in minor or rural districts will not pay.

I submit, is entirely in accordance with my present statement as to the limited use of the private commercial telegraph, the charges for which are increased, and the post messengers in the rural districts, just at the point where they ought to be diminished. If the commercial telegraphs were so extended to equal the seventy-two thousand miles of the postal daily foot telegraph, by separate commercial establishments, and the tariffs requisite to pay for them, it would be, as in the case of the railways, an extension of system of public and exhaustive suckers; whilst by the cheapness of the public establishment, and appropriate charges and extended conveniences, the postal telegraph stations properly administered will become part of the system of feeders.

Grimston takes upon himself to say that the post-clerks "have duties quite sufficient to occupy their time without undertaking the work of telegraph clerks, which they are utterly unfit." He says that, "the telegraph is employed at post-offices in small country towns, villages are quite unfit to be telegraph clerks. Telegraph clerks must commence young, and receive a long training before they become efficient manipulators, and in practice it has been found that persons over the age of 20 years learn the telegraph very slowly, and are not likely ever to attain to thorough efficiency." Can this man of a large telegraph company be really unaware of the fact, that there are a number of village postmasters who do now act as telegraph clerks for common use, and that they are among the most intelligent and successful—more successful than the common railway telegraphers, by whom a large proportion of the telegraphs

throughout the country are worked;—that whilst some instruments are difficult to use, there are other instruments so simple and easy to be learned, that their use is acquired in a week or a fortnight by old people, as well as by young; and that they are readily worked by common shop lads in private commercial establishments? The knowledge of Mr. Scudamore of the telegraph service, and the means of applying it, is, it would seem, better than that of Mr. Grimston, as to the postal service and its capabilities.

The Chairman of the International Telegraph Company sums up the grounds of his opposition to our measure in the following propositions:—1st. "That the extension to any considerable number of small towns and villages would cause an annual loss to the State instead of a profit." That is to say, I presume, that it would cause a loss, by dispensing with separate establishment charges, of office rents and services, and by reducing the length and expense of post messages in England from some eight to one, and in Ireland from seventeen to one, and by using, occasionally, the postal foot messengers for deliveries to these reduced distances. 2nd. "That village postmasters and postmistresses are totally unfit to work the telegraphs." To my answer already given that they are found to be as fit or even more fit than railway porters, I will add that Captain Bolton, of the Royal Engineers, says, "I will undertake to instruct, in the brief space of half-an-hour, any postmaster or postmistress of any country station, who can read and write, to correctly send and receive a telegraphic message by my system." 3rd. Mr. Grimston says "That the delays inseparable from the system proposed for sending out messages would be very great;" i.e., especially in the rural districts where the postmasters, from the comparatively small amount of their business, have the least interruption, and where, as I have stated, the distance and the time of the foot messages in England will be reduced to one-eighth and in Ireland to one-seventeenth. 4th. "That the consolidation and amalgamation of the existing telegraphic companies could, for the reasons already given, be much better effected by the companies themselves, supposing an Act of Parliament could be obtained, than by the Post-office assuming the direction and management of an undertaking about which they cannot be expected to have a practical knowledge." Amongst the reasons given there is this, "That the buildings occupied by the post-offices in London and other towns"—not very many I apprehend—"are certainly not large enough to contain the apparatus and staff of the telegraph companies without considerable expense; and as the post-office is managed in a most economical manner, it follows that the post-office clerks have sufficient to occupy their time, without undertaking the work of telegraph clerks, for which they are entirely incompetent."

Now, my plan at least assumes that to all the most able of the permanent officers of the telegraph companies who chose to stay, the measure would simply operate to a change of masters—a change from private to public service, office, and position—a change to their advantage, whatever it might be to chairmen and directors. But does his plan of amalgamation assume the utilisation of the present ten thousand postal stations and their masters, and the seventy-two thousand miles of daily foot deliveries, or does it not? To assist his conception, I may mention that the aggregate extent of the daily foot deliveries in Ireland exceeds the diameter of the globe, and in the United Kingdom they are in the aggregate of an extent of nearly three times its circumference. If it does dispense with the services of the eight or nine fold establishments, what is the comparative worth of his plan? If it does not dispense with them, is it expected that the control of public establishments and of public offices would be given to private and comparatively irresponsible trading companies? He cannot but admit that there would be a considerable gain by the unity even of the existing telegraph companies competing establishments, apart

from the gain derivable from amalgamation with the postal establishments. "The saving of establishment charges by consolidation and amalgamation," he says, "would of course amount to a considerable sum annually, and had the company dared to hope that Parliament would have granted an act for the federation of their various undertakings, involving a fair and reasonable tariff to have been fixed by Parliament, they would have submitted a bill for that purpose years ago."

Nearly the like propositions have been entertained by railway directorates, and by the directorates of water companies and of gas companies. But having obtained privileges from Parliament on the basis of free competition, the public will say, and the Parliament must say, that they, the companies, must abide by that principle, and that it will not abrogate it in their interest by the creation of any great trading monopoly, seeking profits by exactions on the public necessities, and having comparatively nominal responsibility for their acts. Such a trading monopoly would offer the most serious impediments to the progress of improvement, from having strong interests against it. It would, moreover, perpetuate a vicious principle of administration, that of men having other and more powerful interests to attend to, namely, their own peculiar professional pursuits and interests, and giving only a divided and distracted attention to great subject matters, of a nature to tax the undivided attention of the most competent officers, stimulated by exclusive personal interest in their success. The practical objection I entertain to such plans as that of Mr. Bidder—of Government borrowing money at 3½ per cent. and lending it at 4½ per cent. to the companies, on the security of their lines, to pay off their debenture and floating debts, and constituting the one per cent. beyond the borrowing price into a sinking fund to redeem the roads in time—is, that these plans dispense with the great economies and the immense conveniences of the saving of time and otherwise, derivable from unity of responsible management; they continue the vicious principle of management by the divided attention of practically irresponsible directorates. If the consideration even of a federative direction came to pass, and the continuance of the separate directorates, and the interests of individual directors were set aside, I expect that they would themselves provide for an executive direction under undivided attention and responsibility, and would leave to directorates only functions of inspection and audit, on the French principles of *conseils de surveillance*. But if the separate management by directorates be given up, and the need of public responsibility be duly considered, parties would, I apprehend, concede the need of a governmental authority being at once and directly charged with the work, subject to the control of Parliament.

To return to the assertions of the Chairman of the International Telegraph Company. The assertions of such practical authorities against the economy of telegraphic and railway reform are of the same sort as those of the old practical officers against postal reform. They declared that the penny post would be an utter ruin. In Switzerland and several parts of the Continent halfpenny posts pay. But the fact of a thing being done is, I must submit, cogent evidence of its possibility, and I beg to remind the association that it is being done widely. In Belgium telegraphy was commenced as in England, by trading companies, and they were proceeding in a poor way to themselves, and unsatisfactorily to the public (much on the miserable scale of the companies' telegraphs in Ireland), when they were bought up by the Government, and a system of postal telegraphy established on a uniform franc message principle. This, as I have stated, answered so well that a uniform half-franc message has been adopted, and in the course of a year the revenue has been replaced, and is now going on increasing. In London a small company was established on a plan of sixpenny messages, but the stations being comparatively few and many of the deliveries very slow—not quicker than many other means—it was a failure. In the dis-

trict of Paris there was a postal system of uniform telegraphic messages, which has lately been reduced to half-a-franc. In less than a year there has been a tenfold augmentation, and the use of that telegraph is going on increasing.

In the United States, the recommendation of a committee of the Senate on the post-office and on post roads urging that the post-office department shall be authorized to undertake postal telegraphy as a work of necessity and public convenience, is still before the legislature. In Massachusetts I know, from my own correspondence, and I believe in others of the States, the question we have raised here, as to the resumption of the postal rights, and the reimposition of the Governmental duty in respect to railway communication, are being met there.

The chief economical and administrative conclusions which I have now to submit, are:—That communication by railway forms part of a connected system, for the transit of persons, letters, information, and goods. That as regulating, and predominant controlling function, constantly acting, to ensure punctuality in the departure and arrival of trains, as well as the postal deliveries connected with the trains, the postal function has properly its chief place. That the exercise of this controlling function for ensuring punctuality in the conveyance of letters, is of importance for insuring punctuality in the conveyance of passengers, as well as of parcels conveyed by quick train. That the postal stations and the services of the post-officers and servants should, for the public economy, be utilised for the conveyance of telegraphic messages, as well as of small parcels, as in several continental states. That the police stations, and the naval and military stations, should be combined in a complete system of telegraphic communication. That, hence it follows, as a question of administrative improvement, that the exercise of the functions, for the conveyance of letters, telegraphic messages, passengers, and goods should be combined under one chief and responsible public authority.

Unity of management, under a public authority of railway communication, will be in itself an important advance in public improvement. Unity of management of telegraphic communication in connection with the post will also be in itself an important and much-needed improvement. But jarring action will be avoided—the improvement in the pecuniary and other results will be the more complete and speedy—if the requisite combination and subordination of administrative functions be considered and provided for at the outset.

Ireland has, in its general police, the elements of administrative improvement in advance of England. Ireland has, too, an administration of relief provided for the destitute in advance of that of England. I trust that, through its representatives, it will have, as it ought to have, the lead in the necessary improvement of the means of internal communication.

If I may use a simile derived from sanitary science, I would say that, to give entire freedom to the main arteries of communication, to complete the capillaries of the system, the branch railways—to provide for it, as it were, a new set of nerves of quickened sensation and motion, by a cheap system of postal telegraphy, would, more than any other measures, put the body politic in a condition of healthy and prosperous action, such as has been imparted to Belgium by the like means. By those means unhealthy formations may be made to slough off, and morbid conditions, and febrile action, the result of deficient and interrupted circulation and stagnation, may be best dissipated.

Manufactures.

ALBUMENIZED PAPER.—It appears, by the *Stationer*, that at Dresden albumenized paper is now being made in very large quantities, and is considered the best by

reason of the excellent and regular manner in which it is produced. Although scarcely four years ago the trade was unknown here, the city is now manufacturing at the rate of upwards of 6,000 reams per annum, a quantity that would suffice to print more than 120,000,000 photographs of the size known as *carte de visite*. The albumen is extracted from the white of the new-laid eggs of fowls, and nearly 2,000,000 eggs are consumed, the yokes of which are used by tanners for preparing the finer kinds of leathers. After preparation, the paper is carefully assorted, and from ten to fifteen per cent. is thrown out, but is made available by the Dresden printers for colour-printing.

Commerce.

THE USE OF THE SACCCHAROMETER.—The *Produce Markets Review* speaks of the important aid this instrument is for the analysis of sugars, as shown by a striking experiment carried out by M. Dubrunfaut, and recorded by him in a recent number of the *Journal des Fabricants de Sucre*. Two samples of West Indian sugar, No. 10, of the same shade of colour, and apparently of the same commercial value, after being submitted to the sacccharometer, were ascertained to contain 93·00 and 88·00 parts of saccharine matter respectively; of which only 88·63 and 78·17 represented the extractable sugar. Now the values of these two sugars, according to the usual method of judging by types, would have been the same in each case, at the rate of 54 francs 50 centimes per 100 kilogrammes, but with the aid of the molassometer, the values were ascertained to be in the one case at the rate of 54 francs 69 centimes per 100 kilos., and in the other only 47 francs 25 centimes; so that an English sugar refiner buying by colour, according to the Dutch system of types, would have paid in one case exactly 7·44 per 100 kilos. above its real value! Is not such an instance as this sufficient to convince the most sceptical how necessary it is for us to keep pace with the rapid advances made in the knowledge of this subject on the Continent? What with the disadvantages arising from the unfair operation of the Drawback Convention, and the unwillingness of the refining body to have recourse to even such resources as are in their reach, it is not to be wondered at that continental refiners undersell our countrymen in all the markets in Europe.

TRADE AND REVENUE OF 1866.—The Commissioners of Customs, in their report for the year 1866, say that "the statistics of trade and revenue for that year must be admitted to afford a remarkable example of the vitality and elasticity of the resources of this country." It appears that there has been an increase of twenty-three millions, or 13 per cent., in the values of the exports of British and Irish produce for the year 1866 over those of 1865, which was a year of great national prosperity; that there has been an increase of twenty-four millions in the total imports into the country for 1866 over the year 1865, and a considerable rise in the general consumption of nearly every article subject to duty; and, notwithstanding the extensive reductions that have been made of late years in duties, there is still an increase in the gross customs receipts over those of 1865. This is the more remarkable, considering the disastrous events that occurred in that year: war on a gigantic scale on the continent of Europe, and a seditious outbreak of a very serious nature in the neighbouring country of Ireland; a deficient harvest throughout the United Kingdom, and a monetary and commercial crisis of almost unparalleled severity; besides the cattle plague and the cholera. Notwithstanding these disasters, the report declares that no year since the commencement of the publication of these reports, except 1865, can show so favourable a return.

SWEDISH FILTERING PAPER.—The filtering-paper made in Sweden (says the *Stationer*) is probably better than that produced by any other nation, in consequence of

its being wholly free of accidental salts, which in many papers of similar make often entirely destroy the effects of chemical analysis. The excellence is supposed to be due to its being made entirely of linen rags, more readily procured here than elsewhere, and to the purity of the water. This hint may be serviceable to foreign makers of filtering papers, by causing them to use in its manufacture only distilled water. A recent experiment proved that an equal weight of linen and Swedish filtering-paper being burned, each gave forth the same volume of cinder. At the present time large orders of common writing-papers are being executed at Rosendahl for exportation to England, though possibly it is not known that these qualities contain sixty per cent. of wood-pulp. In spite of this circumstance, however, they meet with a ready sale.

Colonies.

CAPE OF GOOD HOPE.—Large prizes have been offered by the government for tobacco of certain quality fit for exportation to European markets, and this has greatly stimulated its cultivation. Silk culture has likewise been taken in hand, the legislature this season giving the executive authority to lay out mulberry plantations in different parts of the colony for the purpose of encouraging the culture of silk for exportation. The extension of chicory fields is also encouraged that the pure article may be produced, instead of having one that is adulterated imported. A good deal of attention has been directed to improvements in tanning, and experiments have been made with the many acid barks this colony abundantly places at the tanner's disposal to ascertain the best for various purposes.

LAND IN SOUTH AUSTRALIA.—During the year ended 31st March, 1867, 214,431 acres of land were sold by the South Australian government, more than 100,000 acres less than the quantity sold during the same period of the preceding year. The total area of purchased land in the occupation of lease and free holders on 31st December, 1866, was 3,424,721 acres, or 20 acres per head of the estimated population. It appears that the most numerous class of farmers are those with between 100 and 200 acres. With regard to cultivation, the increase of last year was rather better than that of the year before. The total quantity of ploughed land was 739,714 acres, as compared with 660,569 acres in 1865-6.

THE PROVINCE OF OTAGO.—A New Zealand paper says that the abundant harvest of last year has pressed upon the attention of the inhabitants of this province the necessity for improved communication between the interior and ports of shipment. Prices of agricultural produce have ruled exceedingly low, and the heavy cost of carriage interferes to a great extent with the prospect of exporting the surplus with a profit, where the grain has to be carried any great distance. A railway would obviate this difficulty considerably, and tend to bring into cultivation a still larger area than at present, if, by cheapening cost of transit, produce could be grown and exported at a profit. It would be still better if, by a steady stream of immigration, consumers who were likewise producers could be introduced into the province.

GOLD FROM VICTORIA.—From the commencement of the gold diggings in Victoria, in 1851, to the end of 1866, 309,980,71 ozs. of gold have been obtained, of the value of £123,992,284. It is estimated that out of 86,831 square miles, the area of this colony, one-third is occupied by gold-bearing rocks. Out of more than 18,000,000 of acres available for research, less than half a million have been in any way explored. At the end of 1865 not more than 135,000 acres were actually occupied for mining purposes. The value of machinery on the gold-fields is estimated at nearly £2,000,000, giving an average of £23 for every man employed, and of £14 for every acre occupied. The total value of the claims is

estimated at nearly £8,000,000. To increase the yield of gold, the principal thing required is a steady supply of water. Private water-races have been constructed in some districts. In the whole colony there are now nearly 2,000 miles of water-races, the construction of which has cost more than £250,000; but great works are being carried out by Government, which will eclipse all private works. This water supply, which is expected in itself to prove a remunerative undertaking, will stimulate mining industry, and make the yield of gold more uniform all the year round.

NEW ZEALAND COAL.—A valuable discovery of coal has been made in Preservation Inlet, at the south-western extremity of the province of Otago. A vessel which left the latter port some time since on a prospecting expedition, has returned, bringing a quantity of coal obtained from Preservation Inlet. The samples are said to be of good quality, and the best yet produced in this province.

Notes.

ITALIAN WORKMEN AT THE PARIS EXHIBITION.—A commission of artists and workmen has just been sent by the town of Trent, under the guidance of Professor Rosetti and a young architect, Signor Taminini. The twenty-one districts of Trent, situated in picturesque and fertile valleys, alone form an important agricultural and industrial country. Silk and wine form the principal elements of wealth in this district; the olive and tobacco are sufficient to supply an important trade. The forests are numerous in these valleys, and timber of every quality grows with the same rapidity as in Norway. The mineral resources are most extensive, and only require to be worked, and the provinces of Trent will become the Switzerland of Italy—the vineyard of Bavaria and the Tyrol. The Vinicultural Society of Trent, founded three years ago by the late M. Boscarelli, is most prosperous, and the wine produced by it rivals in quality those of Italy and the Rhine. Numerous silk-spinning mills, tanneries, paper-mills, manufactories of silk stuffs and velvets, iron and copper-works, of which several are honourably represented at the Paris Exhibition, are scattered about in this country, but in a small relative proportion, considering its production of combustibles, water-power, and industrious population of 400,000 inhabitants.

FOOT-BRIDGES ACROSS THROGGED STREETS.—The authorities of Paris have accepted a tender for the construction of an experimental iron bridge for foot passengers, for the junction of four streets. The experiment of relieving crowded streets by such means is to be tried, at first, at the spot where the Rue de Madrid and Rue Rochet cross each other.

Journal of the Society of Arts.

FRIDAY, OCTOBER 25, 1867.

Proceedings of Institutions.

AVENHAM (PRESTON) INSTITUTION FOR THE DIFFUSION OF KNOWLEDGE.—The thirty-ninth annual report, presented on the 1st inst., records that the year has been, on the whole, one of satisfactory progress for the Institution. The number of members has undergone an increase of more than ten per cent. In the income from subscriptions the increase is still more considerable, being fifteen per cent. The constantly growing requirements of readers in the library, reading room, and news room, have been liberally met. In the evening classes some extension has been made in the range of instruction afforded, the attendance of pupils has been larger than in previous years, and the results of the several examinations held during the year have been most encouraging. The chess and conversation room, opened in the early part of the year, promises to be very popular. The number of members on the register is 507; the number last year was 466. The library now contains 8,116 vols., of which 276 have been added during the year. Classes in the following subjects were in operation during the class session:—Fine art, freehand, model, machine and mechanical drawing, geometry, and perspective (School of Art); inorganic chemistry, animal physiology, geology, and the principles of mechanics' (science classes); mathematics, English history, the French language, phonography, and the usual elementary subjects. The number on the class register is 312. Examinations have been held by the Society of Arts, by the Science and Art Department, by the Union of Lancashire and Cheshire Institutes, and by the council of the Institution. The School of Art has now been in existence seven years, and has, subject to occasional fluctuations, continued to make progress. With reference to the science classes, although the number of students on the register during the session was large, and the attendance was good, only seven candidates presented themselves at the examination, in May last. The Examinations of the Society of Arts, and the local examinations held by the council of this Institution, have been adopted this year for the first time. The results of the Examination of the Society of Arts are very satisfactory. The local examinations are instituted by the council with the view of affording the stimulus of recognition and reward to the efforts of class students whose cases might appear not to be sufficiently met by the provisions of the other examinations. A special feature of the local examinations was formed by the "English Composition Prizes" offered by the President of the Institution. These prizes were offered for English essays, the subjects being—For males:—1, "The Influence of Education on Life, Character, and Manners;" 2, "On Economy in the Expenditure of Money;" 3, "On the Choice of Books, and the Art of Reading Them;" 4, "On the Qualities which Conduce to Success in Life;" 5, "On the Advantage and the Means of Public Recreation;" 6, "A Description of the Avenham Parks." For females:—1, "On the Advantages of Education;" 2, "On Home Comfort;" 3, "On Household Economy;" 4, "On Good Manners and Obliging Behaviour;" 5, "On Dress;" 6, "On the Means of Recreation Consistent with the Discharge of the Duties of Domestic Life." For the prizes offered to males not more than three competitors appeared; for the prizes offered to females there appeared no competitors. The treasurer's accounts show that the

current expenditure has been met by the income, which was £546 lls. 10d. The penny bank account shows a balance of £35 14s., representing deposits still remaining unclaimed. While, in conclusion, the Council refer with satisfaction to the steady progress of the Institution, indicated in the present report, and while they fully recognise the value of the results already accomplished by the Institution, the Council cannot but feel how inadequate are these results when viewed with reference to the number and educational needs of the class to which the Institution more particularly addresses itself,—the artizan class. So far as the agency of this Institution is concerned, these educational needs must remain inadequately provided for, until the pecuniary resources of the Institution are considerably augmented. A large addition to the machinery of the evening classes is urgently called for, and this, with the limited pecuniary means and building accommodation at their command, the Council are not in a position to afford. Class instruction is now everywhere recognised as the chief agency by means of which the objects contemplated by the promoters of Mechanics' Institutions are to be accomplished. In large towns like Preston, however, the full benefits to be derived from this agency will never be obtained so long as the instruction given is confined to one central Institution. Some well devised scheme of district evening classes is, therefore, greatly to be desired. It is believed that no insurmountable difficulty would be found to the establishment of such classes, while their value in diffusing the benefits of education amongst the working population will be apparent to all.

CHORLEY MECHANICS' INSTITUTION.—The report for the year ending August 20th, 1867 (being the eleventh), states that the institution is now out of debt, with a balance of £7 5s. 4d., the year's receipts having been £105 2s. 8d. The number of members for the past year has been, honorary 34, news room 88, and ordinary 79, and the average attendance at the evening classes has been 35. The third examination of these classes, in connection with the Lancashire and Cheshire Union of Institutes, was held in February last, when out of the ten candidates examined, nine obtained certificates. The news room has been supplied during the past year with several new periodicals, and has been attended by a large number of readers. The library and smoking room also continue to be extensively patronised. There have been five penny readings and one concert during the season, which have realised a profit of £3 8s. 11d.

CARBOLIC OR PHENIC ACID AND ITS PROPERTIES.

The following lecture was delivered in French, a few months since, by Dr. Crace Calvert, F.R.S., &c., before the Society for the Encouragement of National Industry in France:—

GENTLEMEN,—I have readily accepted the friendly invitation of your illustrious president, Mr. Dumas, to submit to your notice some facts relative to carbolic acid. But before doing so, allow me to express publicly the feelings of gratitude which I owe to France for having opened to me the way to the profession which I pursue with such pleasure. In truth, it is to the sympathy of scientific men of this country, to the friendly assistance of one of your scientific celebrities, M. Chevreul, and to the liberality of your institutions, that I owe the knowledge I have acquired, the elements of which I gained at the Gobelins and at the Museum of Natural History during the stay I made there. After these remarks I will proceed with the subject of my lecture.

No doubt most persons present are aware that when coals are submitted to the action of a dull red heat, in a retort, products are obtained which may be grouped into four classes.

1st. Gaseous products, commonly called coal gas, and which are now employed in so general a manner as means of illumination, sources of heat and motive power.

2nd. Water containing ammonia and ammoniacal salts, substances which chemistry purifies, modifies, and which are then utilised in agriculture, manufactures, and medicine.

3rd. There distils with the above products a black, sticky substance, of an unpleasant odour, called tar.

4th. There remains in the retort a solid, porous body, which is known to us all as coke.

When the above-mentioned product called tar is submitted to distillation, water first comes over, then there distil jointly with this fluid, liquid carburetted hydrogens, which being lighter, float on it, and are therefore called light oils of tar: and, lastly, compounds heavier than water are collected, which bear the name of heavy oils.

It is these heavy oils which were the first tar products utilised in manufacture. Their consumption made such rapid progress in England, that special manufactories were established for their preparation, and these works were, for a long period, the only ones in which tar products were produced. Most of them were established towards 1837, for the production chiefly of coal naphtha, used for many purposes, and heavy oils, employed for the preservation of railway sleepers, by a process discovered by Mr. John Bethell, by means of which they are preserved twelve, fifteen, or even twenty years; whilst without it they decay after three or four years. I have much pleasure in calling your attention to a very remarkable and very complete work upon the croosoting of wood, by M. Forestier, chief engineer of the department of La Vendée, assisted by M. Marin, an engineer. These gentlemen have made, as you can see, numerous experiments, the result of which is that wood thus treated is preserved from decay in water as well as under ground, and, what is very important, it is no longer destroyed by that very destructive insect the *teredo*.

Lastly, there remains in the still (after the heavy oils and semi-solid substances have distilled off) a product, which is fluid at the high temperature at which this operation is conducted, but which, when exposed to the natural temperature of the atmosphere, becomes hard and brittle, and is known under the name of pitch, and which is so largely employed in Paris under the name of asphalt, bitumen, &c., to form the foot pavements and public walks, as well as for the manufacture of a sort of concrete, called in England patent fuel.

I now come to carbolic acid.

It is twenty years since Laurent, the eminent chemist, first pointed out the easy method of extracting carbolic acid from coal tar. It consisted in submitting the light oils to a fractional distillation, and then treating with a concentrated solution of potash those products which distilled at a temperature between 160 and 200 degrees, separating the alkaline solution from the hydrocarbons which floated on it, and then neutralising by an acid which liberated the carbolic acid.

Such was Laurent's method of preparing carbolic or phenic acid, but pure carbolic acid was only there in a very small proportion; it was, in fact, a mixture composed chiefly of different liquids similar in properties and composition to carbolic acid, and though Laurent succeeded in obtaining pure carbolic acid, still the process devised by him was too expensive to answer as a commercial production; and besides, his method of operating was too complicated.

In 1847, Mansfield, and towards 1856, M. Bobœuf, made known processes which, in fact, were only a modification of Laurent's, for they consisted principally in employing caustic soda instead of potash, and in treating the whole of the light oils instead of a special portion, as Laurent had done; but by these processes a very impure acid was still obtained, from which it was very difficult, as experience has shown us, to extract pure carbolic acid; however, in a commercial point of view, the process of these gentlemen was a step in advance. I may add that it was this impure carbolic acid

which Mr. John Bethell manufactured, at my request, about the year 1847; and it was this impure acid which was also employed by several chemists who, like myself, studied the properties of this substance, and who endeavoured to apply it usefully, either in the production of picric acid, or in preventing the transformation of tannic acid into gallic acid, in tanning substances, &c. finally, in the preservation of subjects for the dissecting-room. M. Bobœuf also made use of it in preserving organic bodies from putrefaction, a property which he received of late very important applications.

In 1859, M. Marnas, of the firm of Guinon, Marnas, and Bonnet, of Lyons, came to Manchester, and asked me to furnish him with a purer carbolic acid than had been yet manufactured. He showed me a white and crystalline product, which he gave as a specimen. It was then necessary to make new experiments, and I discovered that the best mode of preparation was not by treating light or heavy oils of tar with concentrated alkalis, but, on the contrary, treating the impure benzines of commerce or naphthas with weak alkaline solutions. By this means a semi-fluid, blackish product was obtained, a little heavier than water, of a density of 1.06, and which contained 50 per cent. of real carbolic acid, which acid I managed to separate in part by careful distillation. It is this product which was employed by Messrs. Guinon, Marnas, and Bonnet, and others, till 1861, for the manufacture of colours derived from carbolic acid. At this period the colours obtained from aniline were so fine and brilliant that, to keep up a comparison with them, it was necessary to improve those derived from carbolic acid. To effect this it was necessary to improve the quality of the carbolic acid then manufactured, and, after some trials, we J. C. Calvert and Co.) produced carbolic acid in white detached crystals, melting at between 26 and 27 degrees, and I may here add that this is the product which is now generally employed in commerce and industry, for there are numerous examples of it at the present Universal Exhibition. In 1863 this relative purity was not sufficient. The same firm which had requested the improvement which I have before named asked us to try and make it still purer. We again set to work, and produced commercially Laurent's carbolic acid; that is to say, a substance melting at 34 degrees centigrade, and boiling exactly at 186 degrees. This became a very important commercial product for us, and we delivered large quantities monthly.

From this time I made many efforts to draw the attention of medical men to the really remarkable therapeutic properties of carbolic acid, but the tarry and sulphurous smell which it still possessed was a serious obstacle to its application. I soon succeeded in overcoming this difficulty, and towards the end of the year 1864 our firm was in a position to deliver in considerable quantities carbolic acid deprived of sulphurous compounds, and therefore fit for all medicinal uses. But I am glad to say that the series of improvements in the manufacture of pure carbolic acid did not stop there, for towards the end of last year I discovered a process which now enables me to show you a product completely deprived of all disagreeable odour and tarry flavour, and, in fact, as pure though extracted from tar, as if it had been produced artificially by the help of the reactions recently discovered by Messrs. Wurtz and Kékulé, based upon the direct transformation of benzine into carbolic acid, or by the well-known changes by which it may be obtained from salicylic acid or nitro benzoic. This carbolic acid is distinguished from Laurent's in being soluble in 30 parts of water, whereas the latter requires 33. It is fusible at 41, instead of 34, and boils at 182 degrees, instead of 186, but it gives, like Laurent's, the blue colour described by M. Berthelot when mixed with ammonia, and to the solution is added a small quantity of a hypochlorite; the same effect is also produced when you expose to the vapours of hydrochloric acid a chip of deal soaked in this pure carbolic acid.

It was supposed that, as Laurent's acid had a constant boiling and crystallisation point, it was a pure and definite

substance. Now, the production of our new acid shows it is nothing of the kind, the product of Laurent being only a mixture of our pure carbolic acid and a liquid homologue; for when to the acid of Laurent is added a certain proportion of water, and the mixture is exposed to a temperature of four degrees centigrade, it deposits a crystalline substance in large octahedrons; this substance is a hydrate of carbolic or phenic alcohol, that is to say, carbolic acid combined with an equivalent of water of crystallisation. This fact is important in a chemico-theoretical point of view, for it exhibits the only example known of an alcohol which, combining with water, forms a crystallised and solid hydrate. By removing from this hydrate the equivalent of water which it contains, carbolic acid is obtained in its purest state.

We will now rapidly glance at the applications which have been made of this product for sanitary purposes, in medicine, agriculture, and manufactures.

The disinfectant or rather antiseptic properties of carbolic acid are very remarkable. The beautiful researches and discoveries of M. Pasteur have shown that all fermentation and putrefaction is due to the presence of microscopical vegetables or animals, which, during their vitality, decompose or change the organic substances, so as to produce the effects which we witness, and carbolic acid exercises a most powerful destructive action upon these microscopic and primitive sources of life. Carbolic acid, therefore, is an antiseptic and disinfectant much more active and much more rational than those generally in use.

And allow me further to add that disinfectants, such as chlorine, permanganate of potash, or Condy-fluid, operate by oxidising not only the gaseous products given off by putrefaction, but all organic matters with which they may come in contact; whilst carbolic acid, on the contrary, merely destroys the causes of putrefaction, without acting on the organic substances. The great difference which therefore distinguishes them, is, that the former deals with the effects, the latter with the causes. Again, these small microscopic beings, these ferments, are always in small quantities as compared to the substances on which they act, consequently a very small quantity of carbolic acid is necessary to prevent the decomposition of substances; therefore, its employment is both efficacious and economical. Moreover, carbolic acid is volatile; it meets with and destroys, as Dr. Jules Lemaire says, the germs or spores which float in the atmosphere, and vitiates it, and this cannot be the case with Condy's fluid, chloride of zinc or iron, which act only by contact, and are mere deodorizers. This is why carbolic acid was used with such marked success, and therefore so largely, in England, Belgium, and Holland during the prevalence of cholera and of the cattle plague. The antiseptic properties of carbolic acid are so powerful that *roses*, even *roses* will prevent the decomposition, fermentation, or putrefaction for months of urine, blood, glue solution, flour, paste, feces, &c., &c.; in fact, its vapour alone is sufficient to preserve meat in confined spaces for weeks; a little vapour of this useful substance will preserve meat for several days in the ordinary atmosphere, and prevent it being fly-blown; lastly, *roses* has been found sufficient to keep sewage sweet; and I am proud to say that the British Government have decided to use exclusively our carbolic acid (as a disinfectant), not only on board her Majesty's Navy, but in other Government departments. Although questions of public health are the province of medicine, still permit me to say a few words on the medicinal properties of carbolic acid. This question deserves to be treated thoroughly, for carbolic acid is susceptible of so many applications in this direction; its properties are so marked, so evident, and so remarkable, that they cannot be too much published, and it is rendering a service to mankind to make known the employment of so valuable a therapeutic agent.

I wish all who are listening to me were medical men, for I could show, by numerous and undeniable facts, the

advantage they might derive from carbolic acid, and if my testimony was not sufficient to convince you, I would invoke the authority of men justly esteemed amongst you. I would recel to you the words of the good and learned Gratiolet and those of Dr. Lemaire, showing that carbolic acid is the most powerful acknowledged means of contending with contagious and pestilential diseases, such as cholera, typhus fever, small pox, &c. Maladies of this order are very numerous, but in carbolic acid we find one of the most powerful agents for their prevention. Besides its antiseptic action, the caustic properties of carbolic acid are found useful; most beneficial effects are obtained from it in the treatment of very dangerous and sometimes mortal complaints, such as carbuncle, quinsy, diphtheria, &c., as shown by Dr. Turner, of Manchester, and also in less severe affections, such as hemorrhoids, internal and external fistulas, and other similar complaints. But what must be especially mentioned is the employment of carbolic acid in preserving in a healthy state certain purulent sores, and preventing the repulsive smell which comes from them, a smell which is the symptom of a change in the tissues of the flesh, and which often presents the greatest danger to the patient. The services which carbolic acid renders to surgery can be judged of by reading several most interesting papers lately published in the *Lancet* by Mr. Lister, F.R.S., on compound fractures, ulcers, &c., &c., and by visiting the two sick wards of Dr. Maisonneuve, at the Hotel Dieu. Further, I must not overlook the valuable application made of it to gangrene in hospitals by the eminent Mr. Paget. Lastly, it has been used by many of the most eminent medical men with marked success in those scourges of humanity, phthisis and syphilis.

In agriculture our firm has stimulated the employment of the carbolic acid for the cure of certain diseases very common to sheep—scab, for example. The method of treatment customary in similar cases was very imperfect as well as dangerous, whilst with carbolic acid this malady is cured, and without danger to the animal, by dipping it for a minute, often only for some seconds, in water containing a small quantity of carbolic acid. For this purpose pure acid would be too expensive, and is not used, nor concentrated acid, which ignorant men who have the care of sheep would not know how to use, but by the help of soap an emulsion is made. After having shorn the sheep it is dipped in this mixture; a single immersion in a bath containing $\frac{1}{10}$ of it is sufficient to effect a cure. After scab, the foot-rot is one of the worst and most frequent complaints. Carbolic acid is also for that an efficacious remedy. For this a mixture is made of the acid and an adherent and greasy substance, capable of forming a plaster, which can be made to adhere to the animal's foot for two or three days, preventing the contact of the air, allowing time for the application to produce its effect. But if the flock be numerous, it would take a long time to dress the four feet of each animal one after another; so, to make it more easy, a shallow tray is made of stone, a sort of trough; this is filled with the medicated mixture, and the sheep are made to pass through it; their feet are thus impregnated with the required substance. Permit me also to state that cattle cease to be annoyed with flies, &c., if washed with this solution, or a weak solution of carbolic acid.

Manufacturers have not yet availed themselves one tithe of the valuable properties of carbolic acid, and in this direction a new field is open to its use; still I may cite a few instances. The preservation of wood has been already referred to, and, thanks to its use, the great trade in skins and bones from Australia, Monte Video, Buenos Ayres, &c., is benefited. Wild animals living there in herds are slaughtered by thousands. Formerly they came to us in a bad state, half putrid, emitting an insupportable odour, and only fit for manure; in this state their price was not more than 150 francs the 1,000 kilogrammes, now, thanks to carbolic acid treatment, they arrive perfectly preserved; they can be employed for all the uses to which green or raw bones are usually applied, and the value of

bones is raised as much as from 250 to 300 francs. Hides also arrive putrid, unless they have been dried rapidly in the sun or salted, which necessitated a long and costly operation; whilst it is only necessary to immerse them for twenty-four hours in a solution of two per cent. of carbolic acid, and dry them in the air, to secure their preservation. It is probable that in a short time the blood, intestines, and other parts of these animals will be, by means of carbolic acid, converted into manure, and imported into this country. In England carbolic acid is used in the preservation of guts at the gut works, for keeping anatomical subjects, and the preservation of all animal matter. Carbolic acid is also utilised in preventing the decomposition of the preparations of gelatine and albumen, used in spinning, dyeing, and calico printing.

One of the most interesting chapters in the history of carbolic acid is certainly that which treats of the production of colouring materials; they alone enter into comparison with those derived from aniline, and often enter into successful rivalry with them. Amongst the colouring matters derived from carbolic acid, the most important is, without fear of contradiction, picric acid. The discovery of this acid dates back to a distant period; it was studied by Welter, and was called Welter's bitter.

My illustrious master, M. Chevreul, resumed in 1807 the study of the action of nitric acid on organic matters, and showed, in an admirable paper, that picric acid was often produced when organic matters were acted upon by nitric acid. M. Chevreul discovered in the products of the oxidation of organic substances through nitric acid two different bodies, which he called *amer au minima* and *amer au maxima*, the latter being picric acid. This acid was again examined by Laurent in 1841. This profound chemist showed that the true generator of picric acid was carbolic acid; that in the action of nitric acid on the latter it formed three nitrogenated compounds, mononitrophenic acid, binitrophenic acid, trinitrophenic acid, the latter being also picric acid.

These interesting results of Laurent would perhaps have remained for a long time without any commercial value if picric acid had not been applied to dyeing, in 1847, by M. Guinon, senior, of Lyons. Since then the use of this acid has been much extended, not only in producing magnificent yellows, but also, joined with indigo, in the production of ordinary greens, or of *vert Lamière* with Prussian blue, so that its consumption may be valued at from 80 to 100,000 kilogrammes annually; our firm alone produces more than 300 kilogrammes weekly; and when it is considered that 1 kilogramme of picric acid dyes to an intense shade 70 to 100 kilogrammes of silk, or 40 to 50 kilogrammes of wool, the enormous quantity of textile materials dyed by this single product may be appreciated.

The processes used for the preparation of picric acid are still those which Laurent indicated in 1841; but instead of using carbolic acid, loaded with the heavy oils of tar, as M. Guinon had done, I sought to diminish the quantity of nitric acid, employed in mere waste, on the heavy oils of tar, which were then mixed with carbolic acid, and I am glad to say that since 1852 I have used, in the manufacture of picric acid, carbolic acid containing only some of its liquid homologues. In 1856, M. Bobœuf took out a patent in France for making picric with carbolic acid. But picric acid was then at a high price, and it is only since our firm has obtained carbolic acid cheap that picric acid can be produced freed of all those resinous materials which prevent its purification and low price; in fact, owing to our pure carbolic acid, picric acid is now manufactured chemically pure; this product, which was sold some years since at 30 to 40 francs the kilogramme, is now sold at the rate of 10 francs. Further, I may add that to apply it in a quick and economical manner it is desirable to add to the dye bath a small proportion of sulphuric acid; this method of manipulation, which is not generally known, is very

important, for it is only in this way that the textile materials can be readily dyed, and the baths exhausted.

I shall now have the pleasure of calling your attention to the production of two new colouring substances derived from picric acid:—

1st. *Picramic acid* was, in the first instance, obtained by Wöhler; by making sulphate of iron act upon picric acid, and neutralising with caustic barytes, a deep brown salt was thus produced, from which he separated the barytes by the help of sulphuric acid, and by these reactions M. Wöhler obtained an acid to which he gave the name of nitro-hematic acid; but it is to M. Aimé Girard that we owe the practical process by means of which we are able to manufacture great quantities of picramic acid. This acid imparts to silk a beautiful series of brown tints, similar to those obtained from catechu.

2nd. *Isopurpurate of ammonia*. It is with much pleasure that I noticed, at the exhibition, in M. Casthalar's case, a coloured material, known in the trade by the name of soluble garnet, which, I am informed, is used especially by M. Chalmel, of Puteaux; this substance is particularly remarkable, as it is isomeric with the *purpurate of ammonia* or *murexide*. Although the preparation of this colouring material was first pointed out by M. Carey, still it is really due to a previous discovery, by Hlasiwiz, who called attention to the reaction of cyanide of potassium upon picric acid, and to which chemical reaction we owe the knowledge of manufacturing the isopurpurate for industrial purposes.

Before taking leave of picric acid it may not be without interest that I should state a curious application which has been made of the explosive property of its salts. During these last few years the picrate of potassium has been employed in great quantities, by Mr. J. Whitworth, for charging the bombs for destroying the iron plating of ships. When the projectiles thus prepared strike the iron masses, the enormous propelling force with which they are expelled from the gun is instantaneously converted into heat, and to such an extent that the ball becomes red hot, the heat decomposes the picrate of potash, and a violent explosion ensues, owing to the enormous quantities of vapours and gases which are generated in an instant of time. Whilst the alkaline picrates are endowed with such formidable properties, they also possess properties which are useful for the alleviation of human misery. Picric acid is an efficacious remedy in intermittent fevers. Persons affected with such types of fever, upon whom quinine has lost all its beneficial effects by continuous usage of it—and this is the case with some of our soldiers who return from India—derive, I am glad to say, wonderful benefit from the use of picric acid and picrates, as Dr. Aspland has proved to be the case, at the military hospital at Dukinfield. The knowledge of this fact may be useful in districts in which exist poor populations, for it affords them a cheap febrifuge; and, moreover, picric acid is not dangerous, as arsenical preparations are, nor does it derange the stomach like quinine.

To return to the colours derived from carbolic acid, allow me to remind you that when, in 1834, Runge discovered that acid amongst the products of coal tar, he observed at the same time the existence of two colouring substances, to which he gave the name of rosolic acid and brunolic acid.

I will not detail here the processes by which Runge extracted these substances from the residue of coal tar by means of lime, nor the method adopted by Messrs. Smith, Dussart, and Jourdin for producing these substances by direct oxidation of phenic or carbolic acid, but will describe rapidly the process which we now use to manufacture rosolic acid, and which should not be attributed, as is generally believed, to M. Kolbe, as it is due to M. Jules Person, the son of the celebrated Professor of tinctorial chemistry in the Conservatoire des Arts-et-Métiers. His process consists in making quail

upon sulphophenic acid at a temperature of 0 degrees, and the product which results from a bronze green appearance of cantharides. To be suitable for employment in dyeing it is only to wash it so as to separate from it all the acid with which it is contaminated. It is then under the name of yellow coralline or aurine. It is a firm who first, in 1863, discovered that rosolic prepared could be employed directly as a dye, reduced it to dyes under the name of aurine. This substance gives to silk and albuminised cotton brilliant orange colours, like those of basic chromate or of turmeric. In 1860 M. Persoz, junior, discovered also that if rosolic acid was heated under pressure with ammonia it gave rise to a red substance, called péonine. Messrs. Guinon, Marnas, and others perfected the manufacture of péonine, and gave it the name of red coralline. This colouring substance on silk and worsted a flame-coloured tint and very scarlets. This firm were also the first to produce a blue, towards the end of 1860, a blue dye, derived from rosolic acid, or, more so, rosolic acid, which they called azuline. Azuline is obtained by heating for several hours at the temperature of about 180 degrees, a mixture of rosolic acid and aniline. It is only necessary then to treat the product with sulphuric acid, and to wash it with water, to produce a beautiful blue colouring matter, which, when dry, a red mass with gold-coloured tints. Azuline, although discovered before the aniline dyes, which have since become formidable rivals to it, I may add, manufactured in competition with

Messrs. Guinon, Marnas, and Bonnet is also due to the production of a green derived from coal tar. It was manufactured in 1863, therefore some time before the appearance of an aniline green, known as d'Uzèbe, which, however, with the exception of this green, is the only one now employed in dyeing. Viridine was obtained by this firm from a mixture of aniline, benzoic, and rosolic acids. Viridienne, discovered in 1863, by M. Roth, is another green matter derived from phonic acid; it produces a deep garnet red to a golden buff. Viridienne is produced by the action of nitrosulphuric acid. I will now, with your permission, leave for a few seconds the products derived from phonic acid, in order to place before you certain some inventions not sufficiently recognised by the public on aniline colours.

In 1860, Messrs. Clift, Lowe, and I, took out a patent for the direct production on prints, of a green called indine, and the deep blue called azurine, a blue which resembles indigo, and which really, when printed in concentrated form, may be confounded with a

And although I do not desire to deprive Messrs. foot, Carlos Kœchlin, and Lanth, of any of the merit which belongs to them for the production of the beautiful which everyone must have admired in the Exhibition I may be permitted to remark that their process is based upon the oxydation of aniline by chlorate of potash, which is therefore based on our patent, previously granted to their discoverers. The difference between their process and ours consists in the addition of a salt of iron, which addition is so important that I have no hesitation in saying it has decided the success of a process which now stands unrivalled.

I cannot conclude this retrospective review without calling your attention to a fact which seems to have escaped my colleagues; it is that the majority of the beautiful colours obtained from aniline are due to the industrial application of a discovery made by your illustrious president, M. Dumas, more than thirty years ago. The discovery I mean is the principle, so rich and fruitful, which he named the law of substitutions; a law which has thrown so bright a light on modern chemistry, which has prepared the way for such brilliant achievements, and which, I say, has also been the foundation of

the production of the beautiful colouring substances which we all so much admire. Thus, in order to obtain aniline blues, violets, and greens, produced by the methods devised by the illustrious chemist, Dr. Hofmann, we substitute for a certain proportion of the hydrogen of rosaniline, an equivalent quantity of the alcoholic radicals, called phenyl, ethyl, methyl, and amyl. Further, this celebrated chemist has also shown that the blue obtained by Messrs. Girard and Delaire are also due to the same laws.

I am far, I regret to say, gentlemen, from having named all the remarkable properties and applications of carbolic or phenic acid; but I trust I have succeeded in making you share my enthusiasm for this valuable agent, which, after having rendered important services to most of the world's industries, still offers to chemists and to manufacturers a wide field for new applications.*

EXPERIMENTS WITH NITROGLYCERINE.

By C. A. RICHTER, OF FREIBERG.†

The following is an account of the results of a comparison of the effects of nitroglycerine and the nitrate of soda gunpowder, which is used in this neighbourhood.

The first experiment was made under the guidance of one of the inventor's agents in the year 1865.

Beihl shaft, which was being sunk 30ft. long by 8ft.

* Dr. Calvert has supplied the Editor with the following additional remarks, explanatory of the distinctions between *deodorizers*, *disinfectants*, and *antiseptics* :—

We beg to offer the following remarks in reference to the peculiar advantages which carbolic acid possesses as an antiseptic, disinfectant, and deodorizer, as compared with substances which act only as disinfectants—such as bleaching powder and sulphurous acid, or with those substances which are deodorizers—as chloride of manganese, green copperas, nitrate of lead, &c.

Deodorizers.—All substances merely acting as such are neither disinfectants nor antiseptics, as they simply remove the noxious gases emitted from organic matters whilst in a state of decay or putrefaction, and as they do not possess the property of arresting decomposition or fermentation, it is no proof that the source of infection has been destroyed, for noxious smells and offensive gases are not themselves the real source of contagion, but merely indicators of its existence—the real source of disease and contagion being due, as proved by the latest investigations in science, to microscopic spores floating in the atmosphere, and which by their ulterior development and propagation, are believed to be the true source of contagion.

Disinfectants.—Under this head may be classed bleaching powder or chloride of lime, sulphurous acid and permanganate of potash: they first act as deodorizers, and then as disinfectants, because if employed in large quantities they will so thoroughly oxidize or act upon organic matters as to prevent them from again entering, at least for a short period, into decomposition, but if the organic substances so acted upon are exposed to the atmosphere, they will again experience decay and putrefaction.

Antiseptics.—Antiseptics, such as corrosive sublimate, arsenious acid, essential oils, carbolic acid, &c., act as such by destroying all source of decay and decomposition, that is to say, they will destroy or prevent the formation of the germs of putrefaction and fermentation, without acting upon the mineral or vegetable matters present. The advantage of their use is, therefore, that they act, when used in small quantities, upon all organic matters in a state of decay; further they are deodorizers, for they prevent the formation of offensive odours, and consequently they may be considered as antiseptics, disinfectants, and deodorizers. The great advantages which carbolic acid possesses over all other antiseptics are, that it cannot be used for any illegal purpose, as arsenic and corrosive sublimate; and further, that its antiseptic properties are so powerful, that a few thousandths of it will effectually prevent the putrefaction of substances such as glue, blood, urine, feces, and the fermentation of all vegetable matters, such as flour, starch, sugar, &c., &c.

Owing to the inducements which have been held out by some traders, large quantities of a fictitious mixture have been sold to the public as carbolic acid. To enable purchasers to protect themselves from fraud, the following test is supplied on the authority of Mr. W. Crookes, F.R.S.:—"Commercial carbolic acid is soluble in from 25 to 70 parts of water, or in twice its bulk of a solution of caustic soda, while oil of tar is nearly insoluble. To apply these tests:—1. Put a teaspoonful of the carbolic acid in a bottle; pour on it half a pint of warm water; shake the bottle at intervals for half an hour, when the amount of oily residue will show the impurity. 2. Dissolve one part of caustic soda in ten parts of warm water, and shake it up with five parts of the carbolic acid. As before, the residue will indicate the amount of impurity. These tests are not given as having any pretension to scientific accuracy, but as affording persons who are desirous of using carbolic acid a rough and ready means of seeing whether or not they possess the right article."

† Translated from the "Berg-und hüttenmännische Zeitung," August and September, 1867.

wide, was chosen as a suitable place for the experiments. The shaft was being sunk in the "country" (i.e., not on the vein), which consisted of hard grey gneiss, now and then only it had a few joints, which rendered the work easier. This happened to be the case on the day of the above-mentioned experiments, and partly explains the extraordinary effect produced by the nitroglycerine. The effect was indeed extraordinary, because boreholes, placed so as to give them twice as much to do as usual, and even more, did their work perfectly, and, indeed, more than sufficiently, for they caused such an accumulation of stuff in the shaft that for three days no more boring could be done, and the men had to devote themselves entirely to winding up the stuff. The holes were bored partly single-handed, and then one inch in diameter and 27 to 30 inches deep, partly by two men, and then two inches in diameter and 36 to 48 inches deep. The holes were charged in the mode originally adopted by the agent. As all the holes looked downwards, the nitroglycerine could be poured in by means of a tin funnel. Upon the top of it a small wooden cartridge, three inches long, containing a little powder, was let down by means of the Bickford's fuse, to which it was attached, and then the hole was filled up by hand, without using any tool at all, first with mud and then with sand or small stuff.

It appeared from these first experiments with nitroglycerine that, without any exaggeration, its power was four or five times greater than that of the powder hitherto in use. From this it naturally followed, as the advantages of a powerful explosive material would be most felt in large workings in close little-jointed rocks, such as sinking a shaft in the "country," that such workings could be carried on much faster than had previously been the case. This advantage which nitroglycerine afforded could only be looked upon as most important.

Besides, other advantages were apparent, which, it is true, did not seem so great as the first, but which, nevertheless, promised to exercise a decidedly favourable influence on the economy of mining. They may be summed up as follows:—

1. Fewer men are wanted for working out a certain sized piece of ground, and fewer holes have to be bored than at present. A dearth of miners may to a certain extent be remedied in this manner, and less steel and iron will be used than hitherto.

2. Nitroglycerine does not take fire easily, and when lighted burns but does not explode, and goes out as soon as the flame with which it had been brought in contact is taken away.

3. The holes can be tamped easily, quickly, and without danger.

4. The amount of smoke after a blast is small compared with that of powder, and workmen can go back at once to the place where they have blasted without trouble. This is a considerable advantage in places where there is but little draught, and holes can be bored and fired singly, which was hitherto almost impossible in consequence of the all but impenetrable smoke, and had to be avoided as much as possible.

5. Holes that have missed or only partly torn can be retamped and shot off, which, with the present arrangements is either impossible or accompanied by great danger.

Against these advantages must be set the following disadvantages:—

- a. The gases formed during the explosion of the nitroglycerine have an injurious effect on the organs of sight and respiration.

- b. Nitroglycerine explodes on being struck smartly, and easily freezes.

- c. The masses of rock which it removes are mostly very large, and considerable time has to be spent in breaking them up.

With regard to the first of these disadvantages, it should be remarked that during the first day's experiments, scarcely any signs of pain in the eyes or head

were remarked, although the bottom of the shaft was not particularly well ventilated; later they grew more and more marked, so that it became gradually more apparent that where nitroglycerine was used every effort should be made to secure good ventilation. In the course of time, however, the workmen seem to have become accustomed to the smell, and this disadvantage of the nitroglycerine was no longer looked upon as one which need restrict its employment.

The dangerous property of nitroglycerine of exploding from a smart blow, cannot be denied, but this is not more dangerous than the property of ordinary gunpowder of taking fire readily and exploding; and again, the fact of its freezing must be looked upon rather as an inconvenience than a danger.

We must allow that the last of the three disadvantages also exists; holes blasted with nitroglycerine throw down large masses rather than small. These may easily be broken up with a sledge, or, if necessary, be blasted. At all events, it is no greater disadvantage than what happens so often with powder; the rock is blown into small pieces, which are sometimes thrown to a great distance, and may perhaps do damage, not only to the workings but also to the miners. On the contrary, it would seem to be rather an advantage than a disadvantage that the rock should be thrown down gently and without danger, because the workmen, the timbering, and masonry are not so liable to be injured as in blasting with powder.

All the results of the first trials with nitroglycerine were so favourable, that they naturally instigated us to obtain further and more certain proofs of the possibility of practically employing nitroglycerine underground. A comparative experiment was made between the nitrate of soda powder in use here and nitroglycerine at Segen Gottes mine, in sinking a shaft, in driving a level, and in stopes. The nitroglycerine was tried first; 226 holes were bored, in all 5,043 inches (English) deep. Of these holes, 180, or 80 per cent., tore perfectly, 40, or 17 per cent., only half, whilst 6, or 3 per cent., did nothing. 9,302 cubic fathoms (English) of ground were removed: the smith's cost was £1 6s.; blasting materials cost 17s. 14d.; nitroglycerine, £11 11s. 6d.; wages, £23 12s. 9d.; so that the cubic fathom cost £4 0s. 4d.; the end, on account of its small dimensions, costing comparatively the most, and the sinking of the shaft, for the opposite reason, being the cheapest work. The experiment with the nitrate of soda powder was then made: 559 holes were bored, in all 9,249 inches deep, or 333 holes, with a depth of 4,206 inches more than in the previous experiment. 315, or 57 per cent., tore perfectly; 225, or 40 per cent., only half; and 19, or 3 per cent., not at all. By means of these holes, 6,036 cubic fathoms of ground were removed, in which the end and the stopes do not stand anything nearly so far behind as in the first case. The smith's cost was £1 18s. 2d.; blasting materials, 9s. 7d.; powder, £3 13s.; wages, £24 7s. 10½d.; so that the cubic fathom cost £5 0s. 9½d. With powder, therefore, 3,266 cubic fathoms less ground were removed, though the wages (in spite of one case of loss of wages) were 15s. 14d., and the smith's cost 12s. 2d. more; on the other hand, on account of using the needle in blasting, the blasting materials cost 7s. 6½d. less; the powder also cost £7 18s. 6d. less than the nitroglycerine. Taking all together, the cubic fathom with powder cost £1 0s. 6½d. more than it did with nitroglycerine.

These experiments show that the employment of nitroglycerine, especially in large workings, already offers great advantages over ordinary powder, and that these advantages lie in the fact that with fewer holes, and in a shorter time, a greater amount of ground can be removed than by the present mode of proceeding. Besides, in working out any given quantity of ground nitroglycerine is found to do the work much cheaper, on account of the extraordinary force with which it blasts the holes, and the smaller quantity of iron and steel used up. Lastly, the holes can be tamped much quicker and with-

get, as if they are loosely filled with sand, any buff, or even water, they can be considered as fully well tamped. But even a stronger tamping, is in use in the Hartz, has, up to the present time, been entirely exempt from danger, and has doubtless a greater effect, under certain circumstances, than is readily understood. In the Hartz, the cart-made of well-glued paper, are filled with sand in order to make them stiffer, and especially to allow their longer, and thus to spread the explosive force over a greater area; in other words, to give the explosive a greater leverage, and thus increase the effect. A larger quantity of nitroglycerine for each hole is poured into the cartridge by means of a little can, or spout, until the sand is more than saturated, and the whole of the nitroglycerine forms one single mass on the top. A little sand is put so as to close the edges better, and then the upper part is pinched up as it is in the cartridges filled with powder. Where nitroglycerine is used alone, without sand, the cartridges are made long and narrow for the reason explained; they are closed with a cork. The cartridge is either carefully let down into the hole, or pushed in with a tamping bar, or scraper. Upon the top of it comes a cartridge, about two or three inches in length, not particularly strong, and filled with good powder, such as black powder: it has the ordinary iron needle stuck but without the reed; a little clay is stuck on the top of the cartridge and round about the needle. The tamping employed is clay-slate beaten up fine, and made into a soft mass with water; this is moulded into lumps, pieces of peat, and when dried is ready for use. Tamping is forced in with the iron-tamping bar, the men one being discarded; the first blows are gentle, then gradually harder and harder until the mass is compacted. The hammer, however, is not used, the tamping being simply rammed in with the iron bar. When the hole is tamped it is clayed over, the needle drawn out, and the top of the reed filled with powder, a paper fuse is stuck in and the hole fired off.

The results obtained by the experiments described above would probably have been greater had the workmen been as thoroughly accustomed to the use of nitroglycerine as they are to that of powder. This may be inferred from the fact that far fewer holes were bored in experiments where nitroglycerine was used than in those where powder was the blasting material employed. Although it must be conceded that holes blasted with nitroglycerine brought about more delay, and caused more time to be spent in winding stuff, and thus caused an increase of time, still the difference in the number of holes drilled is so great that we may assume that the men would have bored more holes if they had had more experience in the mode of procedure adopted with nitroglycerine.

The same thing no doubt happened when gunpowder was first introduced, and probably less work could be done with it, and much more danger accompanied its employment, than has since proved to be the case.

In speaking of the many advantages which, according to these experiments, nitroglycerine possesses over gunpowder, it may be added that still further progress has been made with regard to its introduction, and people have not been stopped even by two accidents which have occurred from using it. In one case walls to keep up a little heap were being built out of some large pieces of rock brought up from the Beihill shaft, and which had been lying out in the air for some time. These walls had to be trimmed a little with the hammer, and during this work a small explosion occurred, slightly injuring the mason in the eye.

The explosion was probably caused by some nitroglycerine which had escaped decomposition and remained clinging to the rock. In the second case a hole in the rock did not tear the rock properly but simply split and widened it. As the miner was removing these loose pieces an explosion occurred from undecomposed nitro-

glycerine which remained in the cracks. Luckily, the man was but slightly injured.

The accidents can only have occurred from the nitroglycerine having been used alone without any cartridge, or from the hole not having been properly clayed, so that the nitroglycerine found means of getting into joints and cracks and escaped decomposition. The consequence has been that nitroglycerine is not so often poured straight into the hole, but is enclosed in a cartridge of paper well joined with glue, and in order to give the cartridge greater strength, and the explosive material a greater area to act on, the cartridge is first of all filled up to a certain height with sand, or, as I have since tried, it is at once filled with common powder.

Now, although it has been remarked that a hole containing free nitroglycerine does more work than one in which the blasting oil is contained in a cartridge, which somewhat hinders the quickness of its decomposition, it must not be assumed that the real reason has yet been hit upon, and before a final decision further evidence must first of all be obtained.

Further experiments were made in the above-described manner in sinking a shaft in clay slate. During a period of three months the men were paid for having worked 372 shifts, £13 15s. 9½d., or, adding in the money paid for extra work, £2 10s. 0½d., altogether £16 5s. 10½d. 251 holes, with a total depth of 7,620 inches, were bored, and 11-972 cubic fathoms of ground were removed. Of these holes 229, or 91·2 per cent., tore perfectly; 18, or 7·2 per cent., only half; and 4, or 1·6 per cent., simply blew out, but could be used again on being recharged. In each shift, then, 67 of a hole, or 20·2 inches were bored, and 0·321 of a cubic fathom of ground removed, which cost 9d., or, including the extra wages, 10½d. The smith's cost was 9s. 4d.; blasting materials, 16s. 5d., and the expense of 99·67 pounds of nitroglycerine £17 18s. 9½d.; so that the total expenditure was £35 10s. 6d., or £2 19s. 3½d. per cubic fathom.

The results of these experiments are still more favourable than those obtained previously, and the reason of this lies in the fact that the experiments were confined to a shaft which was being sunk of greater length and breadth than the previous one, and, consequently, the full effect of the nitroglycerine was obtained. The sinking of the shaft in question has been consequently continued with the aid of nitroglycerine, and with excellent results, for the holes do quite three times as much work as they did with gunpowder. The sinking of course proceeds more rapidly; the complaints about headaches caused by the nitroglycerine have ceased, and no other inconveniences have manifested themselves. It must not be denied that this favourable result is partly owing to the length and breadth of the shaft, the tight nature of the ground, as well as to the porous nature of the clay-slate, and the wetness of the sinking. Still some means should be discovered to lessen or prevent entirely the injurious effect which nitroglycerine has on the health of the workman. If further experience does not bring any other disagreeable qualities to light, there is no doubt that nitroglycerine will be more generally introduced in certain workings to which it is specially adapted, and then further improvements may bring about still more important results than those which have already been obtained in certain cases.

A NEW MODE OF CONSTRUCTING THE SURFACE OF STREETS AND THOROUGHFARES.

By JOSEPH MITCHELL, F.R.S.E., F.G.S., C.E.,

Lately General Inspector of Roads and Bridges in the Northern counties of Scotland.*

The wear and tear of an ordinary macadamized road, and, consequently, its cost of maintenance, are very great.

The explanation appears from experiments which

* Read before the British Association at Dundee.

show that a cubic yard of macadamised stone, when well pressed down in a box with a capacity of 27 cubic feet, contains 11 cubic feet of vacuities; and that a roadway covered with 12 inches of metal, before it is consolidated into a smooth and useful surface, has a large portion of its stones crushed into small particles, and that more than one-third of its dimensions consists of mud and sand. When heavy rains occur, combined with heavy traffic, disintegration of the stones in such a roadway takes place, and quantities of mud are generated in proportion to the amount of traffic.

In the new mode of constructing a roadway which I propose, the vacuities in the metal are filled with cement grout, which, when hardened, forms a concrete, binding together the macadamised stones into a mass impervious to water, and, unlike asphalt, unaffected by heat; while, at the same time, it preserves entire the original size and dimensions of the stone.

Again, everyone must have noticed the tear and wear of the causeway stones in an ordinary street pavement, and the irregularities of the surface of the streets, after six or twelve months' traffic. Granite and other stones of the hardest quality appear to give way under the weight of the traffic. The explanation of this waste may be found in the ordinary mode of constructing street pavement. The stones are laid on a bed of loose sand some two or three inches deep above the soil, and are then beaten down into an approximately even, but really irregular, surface. They are laid $\frac{3}{4}$ ths of an inch to 1 $\frac{1}{2}$ inch apart, and the intervals between them are filled up with sand (which is soon reduced to mud). Thus, each stone is insulated, and made to rest on a yielding surface.

In a street so constructed, the ends of the causeway stones are found, after 12 months' traffic, to be worn down from $\frac{1}{2}$ to $\frac{3}{4}$ of an inch. This arises from the percussion of the wheels of carts and carriages falling from the centre of one stone on to the joint of the two adjoining, which, being on a yielding surface, and the wheels striking on the ends, sink a little from the pressure. When a stone has sunk bodily from $\frac{1}{2}$ inch to an inch, or when a little hollow occurs in the pavement of the street, it will commonly be found that the adjoining stones are much worn, the hollow on the surface increasing the force and effect of the percussion of the wheels. The greater the hollow the greater is the tear and wear from the strokes of the wheels.

The source of waste is seen to be the yielding surface on which the stones are laid. To prevent their tear and wear, what was wanted seemed to be a rigid and perfectly regular surface, by which also the traction might be greatly improved.

These defects in the construction of causeway have long been noticed, and the only remedy hitherto used, and which has been in very general use (but which has always failed), has been, to lay a body of lime concrete, six inches deep, below the stones, and to fill with lime grout the joints or intervals between them. The lime, it has been found, has never consolidated, owing to the stones being beaten down when it is half set, and to the tremor subsequently caused by the traffic. Thus, on the best paved streets, after heavy rain or watering, much mud is generated from the wet unconsolidated lime and sand. Where there is much traffic, as in London, this mud on the surface, in drying, proves slippery and dangerous, and many serious accidents occur in consequence.

The irregularities of the surface, and consequent mud, are increased by two inches of sand being placed between the bed of lime concrete and the bottom of the paving stones.

In the new mode of constructing street pavement which I have proposed, there is first laid down a bed of cement concrete three inches deep (gravel may be used instead of macadamized stone where abundant and cheaper), and to the requisite convexity in the cross section. This concrete quickly consolidates, and entirely excludes moisture or water from below.

On this foundation, the paving stones, five inches deep and three inches wide (a width of three inches gives a better hold to the horses' feet than a width of four or four and a-half inches, which are the common sizes), are built, and when brought to a perfect form, the joints are filled with cement grout. When the whole is consolidated, it forms a surface perfectly immovable by traffic, and impervious to moisture. The wear and tear of the stones arise from the attrition of the traffic only. If the causeway be well made, there should be no irregularities on the surface. Where such irregularities exist, they are due to defective workmanship.

Three experiments have been made to test the merits of the new or concrete road, and two to test the merits of the new form of causeway.

The first trial road and pavement were laid down in Inverness, early in 1865. They have been under traffic for upwards of two years, being passed over by the whole goods traffic of the Highland Railway. The road is now perfectly sound, and it has required no repairs; whereas the macadamized roadway adjoining it has constantly required repairs, and is now full of irregularities and ruts.

The second trial new road was laid in London. As it was important that this plan of roadmaking should be subjected to the test of severe traffic on some of the London thoroughfares, I applied to, and obtained permission from, the Right Honourable William Cowper, Chief Commissioner of Works, to lay down 100 yards of it in length, by 35 in width, on the Mall in St. James's park, at the foot of the Green-park. The whole traffic between the district of Regent-street, Piccadilly, Pall-mall, Buckingham-gate, and the Victoria Station, pass along this route, which is, apparently, subjected to a heavy traffic as any thoroughfare in London.

Subsequently, this road proved a failure, the surface breaking up under the traffic. My explanation of the failure (which was very puzzling at first) is as follows:—The roadway at each end of the experiment was macadamized at the time the experiment was made, and the contractor's men, who were crushing the macadamized road with a heavy roller of three to four tons weight, were inadvertently permitted by the person in charge to pass their heavy roller from end to end continuously over the experiment before it had properly consolidated. The crystalline structure of the cement was injured by this, and in consequence the surface yielded to the incessant cab traffic, and the month of continuous rain to which it was immediately thereafter exposed. The surface was repaired by the trustees, by a coating of two inches of macadamized stone, which was rapidly ground down on the hard concrete by passing vehicles. As the bottom was entire and consolidated, had a coating of two or three inches of new concrete been laid down, with the required time to consolidate, it would have answered all the purposes contemplated; but the surveyor deemed it his duty to remove the concrete surface entirely, which was only done at great trouble, by means of levers and iron crowbars. The experiment was certainly a failure; but, in attempts of realizing new conceptions, it is in the nature of things that there must be repeated failures before success is reached.

The third experiment was made in Edinburgh, and has, in my opinion, proved very satisfactory and successful. A length of 150 feet of concrete road by 45 feet in breadth, and a similar extent of street pavement, were laid down last summer at George IV. bridge, where the traffic is heavy and continuous. One half of the street was laid down with the concrete at a time, and the traffic was rigidly kept off that portion for a month. The other half was then laid down. The whole roadway has since been under traffic for 12 months, and has proved perfectly sound and immovable, not a stone turning up all that time. After the road had consolidated, and had been under traffic during the winter, it was observed that some small hollows had above

themselves at the joinings along the centre of the roadway; this arose from our inexperience in laying down the concrete, and will in future be avoided. These hollows were cut out, and made up with new concrete, and opened for traffic in a week. The result has been that the surface is now perfectly smooth and regular.

The street pavement on the south end of the concrete road was then laid down on a bed of cement concrete three inches deep.

The cement concrete was permitted to consolidate for about ten days, and thereafter the pavement was built on it with cement mortar; and when the stones were regularly set, the joints were filled up with cement grout.

The pavement has also been perfectly successful, the water running off it as from a foot-pavement, leaving no mud; and the only wearing of the surface is from the attrition of the traffic.

It has been stated that the noise of vehicles on the pavement is greater than on the ordinary pavement. I do not consider it greater: The blows arising from the irregularities on the ordinary pavement are noisy, as well as destructive to the road and to carriages; but the noise on the concrete pavement, though not greater, is different, it having more of a ringing sound, like that on a street bound up with frost.

In point of wear and tear, and freedom from mud and dust, this street pavement has many undoubted advantages over that now in common use, particularly where there is heavy traffic; but I anticipate that a road consisting of a good body of concrete would supersede even this species of street pavement.

The following is an extract from a report made by me to Mr. William Duncan, Secretary to the Edinburgh Road Trustees.

"The concrete road cost 6s. 8d., and the paved road 17s., per square yard. A sum of 1s. 8d. per square yard was incurred for excavating and removing the materials of the old road, and for watching; but I calculate that the value of the old materials would go to meet these outlays. The small experiment that has been made, however, is not a good criterion of the cost. In a work on a large scale, the cost ought to be less.

"The advantages offered by this mode of construction on a road under heavy traffic, as far as our experience has gone, are—

"First, diminished tear and wear. The general surface is apparently not worn in twelve months more than one eighth of an inch.

"Second, superior cleanliness. The road is almost wholly free from mud and dust.

"Third, diminished cost and annoyance from repairs. The road has required little or no repairs for twelve months. It requires no scraping or watering; and its maintenance is almost nominal, while the coatings, scrapings, and waterings of a macadamised road under similar traffic in Edinburgh, cannot be done under 1s. to 1s. 6d. per square yard per annum, besides the great inconvenience and discomfort they cause to the public.

"The original cost of a macadamised road nine inches deep, which, before it is consolidated, is crushed into six inches of available material, is about 2s. per square yard, or say somewhat less than one third of the concrete road. In London, where the metal is 20s. the cubic yard, instead of 6s., as in Edinburgh, and where the cement is cheaper, the cost of a road of nine inches of metal will nearly amount to the cost of a concrete road.

"It thus appears that the cost of the concrete road will be proportionally less, and its advantages proportionally greater, in London and towns similarly situated, than in Edinburgh.

"The cost of the concrete pavement, which is 17s. per square yard, is higher than it should be, as the stone was procured from Aberdeen instead of the neighbourhood of Edinburgh, and gravel would have served for the concrete bottom quite as well as the more expensive macadamised stone.

"In conclusion, I consider that the experiment which, through the liberality and public spirit of the road trustees, I have been permitted to make on this most important subject, has been successful—the road having sustained the traffic on George IV. Bridge without a stone being moved for 12 months; and that it only requires further experience in the manipulation and laying down of the concrete to accomplish all that I anticipated from this new mode of road-making."

Since the date of this report, Messrs. Wylie and Slight, engineers in Edinburgh, have been good enough to make experiments which show that the new road possesses another advantage over the old. It was natural to anticipate, that, from the superior evenness and solidity of the new road, the traction would be less upon it than on common roads; and these gentlemen have found that the traction on the concrete road of a waggon two tons weight, against a gradient of 1 in 80, was 70lbs., while, on a common macadamised road of the same grade, wet and muddy, it was 140lbs., or double that on the concrete road. On a road with wheel-tracks through new metal, it was 340lbs.; and on a road newly covered with metal, 560lbs. The gradients of these several roads were 1 in 80.

The experiments are to be further prosecuted, as the dynamometer got injured; and I have every confidence that they will establish the very great superiority of the new road as regards traction—a circumstance affecting the preservation of horses and carriages, and the comfort of travelling. Many experiments will yet have to be made before the merits of the new road and pavement can be held to have been conclusively tested. In particular, it will be necessary to have an experiment on a large scale before the cost of construction and maintenance of the new road can fairly be put in comparison with the cost of construction and maintenance of the roads now in use. But, in the meantime, so far as my experience has gone, I feel entitled to sum up the advantages of the new roadway over the old, in the four following propositions, viz.:—

1st. The tear and wear are less on the new road than on the old.

2nd. The cost and annoyance of repairs are less.

3rd. The mud and dust are a minimum quantity, and there is superior cleanliness.

4th. The traction is less, as has already been proved.

It must be observed, however, that the entire efficiency of this mode of road-making depends on the quality of the cement, which should be the best Portland cement, tested to bear a tensile strain of 500 to 600 lbs. on a bar $1\frac{1}{2}$ inch square. Time, after the road is made, is a great element of efficiency, as the hardness of the concrete gradually doubles in the course of 12 months; but further experiments are necessary to determine the precise time the road should be left for consolidation before it is opened for traffic—a month I found quite sufficient in Edinburgh.

FRIENDLY SOCIETIES IN ENGLAND AND WALES.

The annual report of the registrar of Friendly Societies has just been issued. Setting out in due order with those societies which are generally denominated "Friendly Societies," Mr. Tidd Pratt reports that he has had submitted to him for certification the rules of 1,176 new societies and alterations of rules of 1,487 existing ones, making a total of 2,663 certificates. Forty-three societies, not certificated, have deposited their rules with the Registrar, and, under the provisions of 18 and 19 Vic., c. 63, sec. 44, have obtained protection for their funds against fraudulent officers. Notices of dissolution of 130 Friendly societies have been received, and 83 of them advertised in the *London Gazette*. Concerning the dissolution of these societies, Lord Lichfield, in the latter part of the last session of Parlia-

ment, moved for returns exhibiting the number of societies which had been registered under the Friendly Societies' Acts since the passing of the first of these Acts in June, 1793, and of the number dissolved, and also a supplementary return from the Poor-law Board, showing the number of persons who have become chargeable to the parish, and are paupers in the workhouse, who have been members of friendly societies which have been dissolved or broken up. These returns show that in England and Wales 38,315 societies have taken the benefit of the provisions of the Friendly Societies Acts since June, 1793, and that of these 13,935 have been dissolved, and that those remaining number 24,380. The number of paupers who have been members of dissolved friendly societies is stated at 3,931 in England, and 84 in Wales, a total of 4,015 coming under the immediate notice of the Registrar.

Three or four years ago the public was startled with the revelations Mr. Tidd Pratt made in his annual report, of the proceedings of certain societies (chiefly societies held at public-houses) which periodically made returns to him, and had the effrontery year after year to publish in their accounts the record of expenses illegally incurred in feasting and drinking. A great portion of that illegality has now disappeared, but in its place the Registrar has now to call attention—as he has, in fact, before done—to the excessive expenditure of some so-called friendly societies under the head of “management.”

The Royal Liver Friendly Society, established at Liverpool in 1850, returns its gross receipts at £125,181, its management expenses at the enormous sum of £45,857. As the Registrar points out, out of every £100 received £36 12s. 9d. is spent in management. Its sickness and burial expenses amounted to £60,880; and in proportion to every £1 spent under this head, 15s. 1d. was spent in expenses. The accumulated funds amount to £103,355, but, as in former years, the officials declined to furnish the Registrar with the number of its members, and he is thus unable to make any comparison as to the value per member. Another society, the St. Patrick's (also established at Liverpool), expends £49 15s. out of every £100 it receives in management expenses, and that its resources are very large may be estimated by the fact that £33,270 is returned as its gross income for the past year, and its accumulation as only £17,797, the property of 150,000 members—about 2s. 4d. per head. The Victoria Legal Friendly Society returns its income at £28,431, and its expenditure at £24,140, and its funds at £10,544.

“The Royal Liver,” and similar societies, the Registrar points out, should at once become the subject of exceptional legislation, as they depart almost entirely from the original idea of a friendly society. “It is notorious” (says the registrar) that great hardships are suffered by the persons who join them; that the members are generally poor, that they are spread all over the kingdom, frequently hundreds of miles from the office of the society; they never participate in its management, and the whole business is managed by a few collectors and a central and irresponsible board, over which the secretary reigns supreme, and not the slightest check can be obtained over him. In these societies, in case of death it frequently occurs that a dispute is originated as to whether the member was or was not within benefit (as it is termed) at the time of death, but as in this dispute, on the one side is the society and the secretary—with its large funds and irresponsible manager, on the other, people of the class who generally live “from hand to mouth,” it is quite clear that the weaker party has to give way, and any idea of obtaining legal redress is quite out of the question at present.” The Registrar reports that he had found it necessary to call upon the officers of the Farriers' Society, London, to reimburse certain sums of money—£63 10s. 3d.—which they had legally expended in the reform demonstration, and that a threat of legal proceedings had been effective in

causing the officers to repay the money to the funds of the society.

It appears that out of 23,407 societies only 10,678 returns had been made, and that these returns showed the number of members to be 1,672,176, having accumulated investments to the amount of £6,668,386, of which £1,770,215 was deposited in savings' banks; and that 518 societies had invested directly with the Commissioners for the reduction of the national debt the sum of £1,799,648.

The Registrar reports that savings' banks, co-operative societies, and loan societies being so much connected with the industrial classes, he has thought it right to include in his report statistics relating to these institutions. The number of individual depositors with the old savings' banks in 1866, were 1,376,870; and the amount of their investments was £33,840,096. The number of persons depositing in the post-office savings' banks was, on the 31st December last, 746,254; and the deposits then due to them amounted to the large sum of £8,121,175. The Registrar reports the continued success of these new banks—as may be judged from the following facts:—that in 1866, 186 new postal banks were opened, swelling the total number to 3,507. There were 1,525,871 deposits received, amounting to £4,400,667. The average amount of each deposit was £2 17s. 8d. The withdrawals were 515,348 in number, and £2,975,066 in amount. The average cost of management was 6d. 9-10th for each transaction, 1-10th of a penny less than the cost estimated before the commencement of business. The average cost in the old banks ranged from 10d. to 1s. At the end of 1866, there was standing to the credit of the postal banks (chiefly investments with the National Debt Commissioners) £8,256,968, and the liability to depositors was £8,125,175, showing an excess of assets over liabilities of £135,793, and exclusive of the dividends receivable five days after the account closed. This result is most satisfactory, and shows in the most striking light the great advantage of these banks as providing a means of secure investments for the savings of the labouring classes; and how ready that class is to avail itself of the inducements held out to it. In connection with this system, the plan of Government insurance and annuities appears to be fast gaining ground. From the 17th April, 1865, to the 31st December, 1866, 1,168 contracts for insurance had been made, and the amount assured to policy holders for 1,150 which still remain in existence, is £86,593. The sum received by way of premiums thereon amounts to £4,004 12s. 1d., collected in 4,858 payments. The cost of collection is estimated at £636; and only one insurance had become a claim, and the amount paid thereon was £70 7s. 6d. In the annuity branch during the same period 280 contracts for immediate annuities, assuring £6,427 13s. 6d. per annum, had been granted; and the purchase-money paid to Government for the contracts amounted to £71,568. Forty-four contracts for deferred allowances—under the tables “Money not returnable,” and 73 under those headed “Money returnable,” had been entered into. The annuities to be purchased amounted to £2,338 15s., but 10 of the contracts had been dropped from various causes, and the amount had been thereby reduced to £2,129 6s. The total amount contributed by purchase of annuities, immediate and deferred, was £75,756.

Under the head of “co-operative societies,” the Registrar reports that the returns for the past year made by 436 of these societies show the number of members to be 173,243, an increase of 22,661 during the year; that their invested share capital is £1,048,096, of which £619,638 has been contributed during the year. The result of the cash transactions is shown as follows:—Goods bought, £3,986,754; goods sold, £4,455,569; profits realised, £376,204; and management expenses, £235,464. The value of the assets of the societies is estimated at £1,009,849, and their liabilities are estimated at £334,561.

Commerce.

TEA IN CEYLON.—*The Produce Markets Review* says:—"Mr. Arthur Morice, who has been visiting the tea districts of India, with a view of ascertaining the capabilities of Ceylon as a tea-growing country, has published his report on the subject. As regards soil, Ceylon appears to possess none precisely similar to that described as suitable for the cultivation of tea, but Mr. Morice arrives at the conclusion that there is nothing in the soil to prevent successful cultivation. With respect to climate, the *Colombo Observer* says a great diversity of opinion prevails, and according to what writers have hitherto said it might be supposed that Ceylon is too near the equator to prove a successful tea-growing country. Mr. Morice, however, successfully combats this idea, and although he acknowledges that Ceylon does not in any part possess a climate similar to that of China, Assam, or the Himalayas, yet a comparison with Java (in the corresponding degree of south latitude) and the result of cultivation there, show indisputably that a tropical climate, where the proper elevation can be obtained, is not inimical to the tea plant. Mr. Morice remarks, 'I have come to the conclusion that, at the higher elevations of this island, both soil and climate are sufficiently near those of known tea countries to induce the belief that tea can be grown so as to produce regular crops, and sufficient in quantity to prove remunerative; and that, in all probability, the quality, with proper manipulation, will be such as to enable it to compete with other Indian teas. Tea, in short, is worthy of a fair trial; but, to do the trial justice, the hybrid Assam tea plant should be employed solely. This plant combines the hardness of the China with the superior producing powers of the Assam parent; besides, the hybrid comes into full bearing at least two years before the China plant, under similar conditions.' The subject of tea cultivation in Ceylon is now receiving much attention, and if the soil and climate of the island are, as is stated, so well adapted to the growth of the plant, there is a possibility that in a few years' time we shall have another country's produce competing in the tea market."

EXHIBITION OF WINES AT ALESSANDRIA (ITALY).—An exhibition and wine-fair is about to be held at Alessandria (Italy); it will be opened from the 24th of November to the 2nd of December. This exhibition and fair comprises three classes; that is to say:—Wines exhibited for competition for prizes; wines for sale; and machines and other implements used for the cultivation of vines and for wine making. In the first class will be admitted only wines made by the exhibitor entirely is to say, in the districts of Alessandria, Acqui, Asti, Novi, and Tortona. These wines will be from grapes grown exclusively in the province—that divided into three categories, namely, common table wines, choice table wines, and fine wines. The prizes assigned to these classes and categories consist of three gold and three silver medals, given by the Minister of Agriculture and Commerce; and twelve silver and twenty-four bronze medals, given by the Agricultural Committee of Alessandria (Comizio Agrario d'Alessandria). Besides these, three silver and three bronze medals will be distributed to the best wines of each district competing amongst themselves; and such a number of honourable mentions, as the commissioners may see fit to distribute. In the second class will be admitted any kind of Italian wine; these wines will be sold by public auction, private contract, or at fixed prices. The third class will consist of machines, instruments, utensils, tools, &c., employed in the cultivation of the vine and in wine making. Exhibitors and inventors of every country are invited to compete in this class, the prizes of which will consist of three silver and six bronze medals, and such a number of honourable mentions, as the commissioners may see fit to distribute. The "Prize of Honour" consists of a silver medal, and purse

of eighty francs, given by the Marquis Balbi-Piovera for the best essay or memoir on wine-growing and making, considered with a view to fitting the wines grown in the province of Alessandria for exportation. Anyone desiring to take part in this exhibition and fair is requested to apply, during October, to the Agricultural Committee of Alessandria. The objects intended for exhibition will be received from the 1st to the 15th of November.

Colonies.

AGRICULTURE IN VICTORIA.—The old system of colonial farming, the growth of wheat, hay, oats, and potatoes, is fast giving way, and every year there is more stock kept on the cultivated lands. The great difficulty with most farmers has been the want of sheep-proof fences, as such things were not thought of in the early days, and when profits were diminishing the outlay could not well be incurred. Now, however, no others are put up, so that before long every holder of two or three hundred acres, or even less, will have his flock of sheep; and with the keeping of sheep the cultivation of English grasses extends, although there is still room for much advance in this direction. On only a few properties in the west district is the laying down of land to continue under grass for a period of years beginning to be part of a regular system, but it must become so generally, for in this way is the fertility of the land to be most easily preserved where high farming cannot be adopted.

QUEENSLAND GOLD.—The gold fields in the north of the colony of Queensland are causing no little excitement, as rumours of enormous nuggets are constantly being wafted about. There can be no doubt that that portion of Queensland is rich in mineral wealth, and its resources could have been much more fully developed if really experienced miners had paid it a visit some time ago. Many professional diggers have been deterred from going to this part by some doubt about the presence of gold in paying quantities. The consequence is, that by far the majority of the men on these northern fields are inexperienced, and it will take some time before the full value of the ground is established.

THE PASTORAL PROSPECTS OF QUEENSLAND may be reported as particularly good. Throughout the winter, grass and water have been abundant, and an early and successful lambing season is looked forward to as a means of helping the pastoral settlers through many of their difficulties. A noticeable feature is the excessive numbers of fat cattle and sheep, for which it is difficult to find a market, as the neighbouring colonies, at the present time, are almost self-supporting in that respect. A good many sheep are finding their way across the borders. Boiling down is, however, much resorted to by stockholders. At Maryborough and on the Brisbane, something is being done in the way of preparing meat for exportation; but the general impression is that in future a fourth of the stock of the colony will have to be disposed of for the tallow.

Notes.

THE EXCAVATIONS AT POMPEII.—An interesting report has been published by the Senator Fiorilli, superintendent of the Museum of Naples, and of the excavations at Pompeii, on the important archeological discoveries that have been made in Italy from 1846 to 1866. During this period, no fewer than 25,864 different objects have been found at Pompeii, amongst which the most numerous are 9,831 ancient coins, chiefly of bronze. Various articles of female jewellery in gold and precious stones have likewise been found; necklaces in gold and silver, surgical instruments, sun dials, arms, cymbals

mirrors, lamps of metal, and tools of various trades. Amongst the natural products that have been found in a good state of preservation may be mentioned vegetables of every variety, olives, nuts, dried figs, grapes, apples, and peach stones. Some of the grains of corn that had been buried for ages were sown, and have produced fresh ears of corn, which has been even ground, and the flour made into bread. In this necropolis 27 human skeletons have been disinterred; plaster casts have been taken from some of them. The remains of two horses, eleven fowls, eight dogs and several turtles have likewise been dug out.

PROGRESS OF THE MONT CENIS TUNNEL.—The Italian government have published the usual monthly statement of the progress made in the Mont Cenis Tunnel. According to this the length of the boring up to the 1st September was 7,403.52 metres, to the 1st October, 7532.25 metres; showing a progress of 128.73 metres during the month of September, and as the total length of the tunnel is 12,220 metres, only 4,687.75 metres, or about one-third, remains to be finished.

BEEHÖVEN'S PIANO.—An interesting souvenir of the celebrated composer, Beethoven, is at present in the possession of an inhabitant of the town of Klausenberg, in Transylvania. This instrument, which must have been made more than seventy years ago, is in a good condition; and on one of the panels is painted a portrait of the great musician when twenty years of age. This piano is said to be the one that was presented to him by the maker, Vogel, of Pösch.

President	£31	10	0
Society of Arts	105	0	0
Other Subscriptions already published	384	6	0
The Worshipful Company of Drapers	10	10	0
HER MAJESTY'S GOVERNMENT	500	0	0
Total	£1,031	6	0

Subscriptions may be forwarded to the Financial Officer, Society's House.

Proceedings of the Society.

MEMORIAL TABLETS OF GREAT MEN AND EVENTS.

In order to show how rich the metropolis is in the memory of important personages and events, which it would be desirable to mark by means of tablets on houses, the Council have caused an alphabetical list to be prepared, the fourth part of which is now inserted. Other parts will follow. The Council request the assistance of members of the Society in completing and correcting this list, especially with reference to dates and the insertion of other names.

Whilst the Council intend proceeding with this work, they desire also to see it carried on by others—either by corporate bodies or individuals—and the Council will be happy to be instrumental in procuring suitable tablets from the manufacturers.

Goldsmith, Oliver (b. 1728—d. 1774), poet. He wrote "A Reversion" (Essay No. 4), at the "Boar's Head" Tavern, Eastcheap. He lodged from 1763-4 at the house of a Mrs. Elizabeth Hemming, in Canonbury-place, Islington. From 1758 to 1760 he lived at what was then No. 12, Green Arbour-court, Old Bailey, the right-hand corner as you ascend the steps from Fleet-market. He resided also in Wine Office-court, Fleet-street, and at No. 2, Brick-court, Middle Temple, "up two pair of stairs," where he died, April 4th, 1774. At the Royal College of Surgeons, Lincoln's Inn-fields, he was examined and rejected as unqualified for the inferior office of surgeon's mate. In Salisbury-court, Fleet-street, he sat for a short time as press corrector to Richardson. He was buried in the churchyard of the Temple, 9th April, 1774, at 5 o'clock in the evening. A monument is erected to his memory in Westminster Abbey.

Gondomar, Count (temp. James I.), lived in Ely-house, Holborn; also in No. —, Petticoat-lane, White-

chapel. He reported to King James that the trained bands were the finest soldiers and best armed in the kingdom.

Gordon, Lord George (b. 1750—d. 1793), the hero of the riots of 1780; lived at No. 2, Welbeck-street, Cavendish-square; was imprisoned in the Tower of London, and died in Newgate, the prison he and his rioters had broken open. He lies in the cemetery attached to St. James's Chapel, Hampstead.

Gough, Richard (b. 1735—d. 1809), the antiquary; born in No. —, Winchester-street, Austin Friars.

Gough, Sir John, Baronet (circ. 1728), lived at Gough-house, Chelsea.

Grafton, Henry Fitzroy, Duke of (b. 1663—d. 1690), lived in Arlington-house, now Buckingham-house.

Grafton, Charles, 2nd Duke of (b. 1683—d. 1757), lived in Bond-street (No. —), and it is probable that part of his house is now called the Clarendon Hotel. He was a member of the Kit-Kat Club.

Grant, Sir William (b. 1760—d. 1832), an eminent English lawyer, and Master of the Rolls; was considered a judge of great integrity; lived in No. 3, Lincoln's Inn New-square.

Grantham, Lord (temp. Geo. I.), lived in No. —, Albemarle-street, on the east side; was Chamberlain to the Princess of Wales.

Grattan, Henry, Right Hon. (b. 1750—d. 1820), the orator and statesman; died in No. —, Baker-street, Portman-square; buried in Westminster Abbey.

Gray, Lord (temp. Queen Anne), lived in the lost house on the west side of Cecil-street, Strand.

Gray, Thomas (b. 1716—d. 1771), poet, and a man of profound learning. He was born in a house on the site of 41, Cornhill; the original house being destroyed by fire, Gray immediately rebuilt it. He lodged, when in London, in Jermyn-street, St. James's, either at Robert's, the hosier, or Frisby's, the oilman. There is a monument to him in Westminster Abbey.

Green, Matthew (b. 1696—d. 1737), poet; author of "The Spleen," and other poems; died at No. —, Nag's Head-court, Gracechurch-street.

Grenville, Right Honourable Thos., founder of the famous Grenville Library, which he bequeathed to the British Museum; lived and formed his library at No. 4, Hamilton-place, Piccadilly.

Gresham, Sir Thos. (b. 1519—d. 1579), founder of the first Royal Exchange in London; also founded Gresham College and Gresham Almshouses. His house of business was at No. 68, Lombard-street, (now Messrs. Martin and Stone's, bankers); his sign was a grasshopper; a portrait of him hangs in the Mercers' Hall, Cheapside. He lies buried, and a monument stands to his memory, at St. Helen's Church, Bishopsgate-street.

Grignion, Charles (d. 1810), engraver; lived at 27, James's-street, Covent-garden.

Grimaldi, Joseph (b. 1779—d. 1837), the famous clown; obtained his greatest triumphs at Sadler's-wells; lived, in 1822, at No. 8, Exmouth-street, Spa-fields, Clerkenwell.

Guizot, Francois Pierre Guillaume (b. 1787), the French ambassador; lived at Manchester-house, Manchester-square.

Guthrie, William (b. 1708—d. 1770), author of "Guthrie's Grammar," and other works; died in Great Portland-street, Oxford-street, March 9th, 1770; buried in St. Marylebone cemetery, south side of Paddington-street, where against the east wall is a monument to his memory.

Guy, Thomas (b. 1644—d. 1724), a bookseller in Lombard-street (No. —), built and endowed the hospital in Southwark which bears his name, also built three wards (on the north side of the outer court) of St. Thomas's Hospital, High-street, Southwark. Two monuments are erected to him in Guy's Hospital.

Gwynne, Nell (d. 1687), is said to have been born in the Coal-yard, Drury-lane; she also lived in Drury-

- lane, afterwards in 1670 in Pall-mall, on "the east end, north side," next to Lady Mary Howard, and from 1671 to the time of her death on the south side, in a house on the site of the present Number 79, the office of the Society for the Propagation of the Gospel in Foreign Parts; she is said to have had a country-house in Bagnigge-wells, Coldbath-fields; a portrait of her hangs at the Garrick Club, and in the Privy-garden collection. Buried in St. Martin's-in-the-Fields.
- Haines, Joe (d. 1701), comedian, died in No. —, Hart-street, Covent-garden, April 4th, 1701.
- Hall, Edward (b. 1547), the chronicler, was a student in Gray's-inn.
- Hall, John (b. 1739—d. 1797), engraver, lived in No. 83, Berwick-street, Soho, where he engraved Sir Joshua's portrait of R. Brinsley Sheridan. Buried at Paddington churchyard.
- Hallam, Henry, historian, lived at 67, Wimpole-street, Cavendish-square, where he wrote his "History of the Middle Ages," and his "Constitutional History of England."
- Halley, Edmund (b. 1656—d. 1741-2), astronomer, educated at St. Paul's school; lived in No. —, Prince's-street, Bridgewater-square, also in No. —, Winchester-street, Broad-street Ward, City; his father was a soap-boiler in this street. He lies buried in Westminster Abbey.
- Hamilton, Wm. Gerarl (b. 1727—d. 1796), (called Single-speech Hamilton), lived and died in Upper Brook-street, Grosvenor-square.
- Hamilton, Sir Wm. (b. 1730—d. 1803), the collector of the Hamiltonian gems, and also known as the husband of Nelson's Lady Hamilton; lived and died in what was 23, Piccadilly; his collection was purchased by the British Museum.
- Hamilton, Lady Emma (b. 1764—d. 1815), when Emma Lyon, lived as a nurserymaid at the house of a Dr. Budd, in Chatham-place, Blackfriars, also at No. 11, Clarges-street, Piccadilly (1804 to 1806); married at St. George's, Hanover-square.
- Hampden, John (b. 1594—d. 1643), lived in Gray's-inn-lane, Holborn; here he and Pym held their consultations when the matter of ship-money was pleaded in the Star Chamber.
- Handel, George Frederic (b. 1685—d. 1759), musician, lived at 57, south side of Brook-street, four doors from Bond-street, and two from the gateway, also for three years in Burlington-house, Piccadilly; used to perform "The Messiah" at the Foundling Hospital, of which latter place he was a great patron. He is buried, and a monument is erected to his memory, in Westminster Abbey.
- Hanway, Jonas (b. 1712—d. 1786), the traveller, lived and died in a house in Red Lion-square. He was one of the chief originators of Magdalen Hospital, St. George's-fields, also of the Marine Society for fitting out beggar boys for the sea. He was the first man who ventured to carry an umbrella in the streets of London. After using one for 30 years, he saw them come into general use.
- Harcourt, Vernon, Viscount (b. 1660—d. 1727), Lord Chancellor, lived at No. —, Arundel-street, Strand.
- Harley, Edward, Second Earl of Oxford (d. 1741); founder of the Harleian Library; lived in Harley-street, Cavendish-square. Portraits of him hang in the apartments of the Society of Antiquaries and the British Museum.
- Harley, Robert, Earl of Oxford (b. 1661—d. 1724); the friend of Pope and Swift, lived in Buckingham-street, Strand, in 1706; also in Dover-street, Piccadilly; also in York-buildings, Strand. Was stabbed by Guiscard in the Council-chamber of the Cock-pit at Whitehall. A portrait of him hangs in the British Museum.
- Harlow, George Henry (b. 1787—d. 1819); artist, lived and died at 83, Dean-street, Soho. He is buried under the altar of St. James's Church, Piccadilly.
- Harrington, James (b. 1611—d. 1677), author of the "Oceana;" lived in the Little Ambury ("a faire house on the left hand") which looks into the Dean's-yard, Westminster.
- Harris, Joseph (temp. Charles II.); actor, lived in Salisbury-court, Fleet-street.
- Harrowby, Dudley, Earl of (b. 1762—d. 1847), lived at 39, Grosvenor-square. It was in this house that Thistlewood and his associates plotted to murder his Majesty's ministers, on the 23rd February, 1820, as they sat at dinner.
- Harvey, William (b. 1578—d. 1657), discoverer of the circulation of the blood; lived at Cockaine-house; was physician to St. Bartholomew's Hospital for 34 years. A portrait of him hangs at the College of Physicians.
- Hatton, Sir Christopher (b. 1539-40—d. 1591); Queen Elizabeth's handsome Lord Chancellor; lived in Ely-place (Hatton-house), where he died. Was a member of the Inner Temple; here he danced, when Lord Chancellor, with the mace and seals of his office before him. Buried, and a monument to him in St. Paul's Cathedral.
- Haward, Francis, engraver; lived in 1787 at 29, Marsh-street, near the turnpike (where the railway arch runs across the Westminster-road.)
- Hawkesworth, John, LLD. (b. 1715-19—d. 1773); author of "The Adventurer," and friend of Johnson. He was originally a hired clerk in the office of one Harwood, an attorney, in Grocer's-alley, in the Poultry. Lived, in 1773, in Great Ormond-street, Bloomsbury. Died in Lime-street, Leadenhall-street.
- Hayman, Francis, R.A. (b. 1708—d. 1776), painter; lived in Dean-street, Soho, in the house now divided into Nos. 42 and 43.
- Hazlett, William (b. 1778—d. 1830), a distinguished writer in general literature. In Southampton Coffee-house he laid the scene of his "Essay on Coffee-house Politicians." He lived in 19, York-street, Westminster; also in Frith-street, Soho, where he died. He is buried, and a monument is erected to him, at St. Anne's Churchyard, Soho.
- Head, Richard (b. 1678), author of the "English Rogue," &c.; was a bookseller in Queen's Head-alley, Paternoster-row.
- Heber, Richard (d. 1773—d. 1833), lived in James-street, Buckingham-gate; also in Pimlico, in a small, gloomy house within the gates of Elliott's brewery, between Brewer-street, Pimlico, and York-street, Westminster; here he died. In both houses, as well as at his country seat, Hoderet, and at Paris, he kept large portions of his extensive and noble library.
- Henchman, Humphrey (b. 1675), Bishop of London; lived and died in London-house, Aldersgate-street (as Peter-house was then called).
- Henderson, Alexander, Scotch Church Commissioner; lodged in a house near London Stone, in the heart of the City, in St. Anthony's, close to the church of that name.
- Henderson, John (b. 1747—d. 1787); actor; born in Goldsmith's-street, Cheapside; lived and died in a house in Buckingham-street, Strand. A portrait of him hangs at the Garrick Club. He is said to have made his first essay in acting in a large room on the first-floor of the "Old Parr's Head," Islington.
- Henrietta, Maria, Queen of Chas. I., lived in Somerset-house.
- Henslowe, Philip (temp. Elizabeth and James I.), owner of the Rose Playhouse; stage manager and master of the bears to Queen Elizabeth, and manager of the Paris Eaden Theatre; was originally a dyer on the Bankside, over against the Clink; buried in St. Saviour's, Southwark.
- Herbert of Cherbury, Edward, Lord (b. 1581—d. 1648), lived in the reign of James I., "in a house among gardens near the Old Exchange;" buried in St. Giles-in-the-Fields.
- Herbert, Sir Henry (d. 1673), last Master of the Revels

- brother of Lord Herbert of Cherbury; lived in Lincoln-house, Tothill-street, Westminster; here he established the office of the Revels; lived and died in James-street, Covent-garden, "on the west side, in the red brick house, the last but one before the street abuts on Hart-street." His office book as Master of the Revels throws great light on the history of the stage at the time of Charles I. Buried in St. Paul's, Covent-garden.
- Herbert, William (b. 1719—d. 1795), typographicist; was a printseller on the old London Bridge at the time the houses were taken down.
- Hertford, Francis Charles, Marquis of (b. 1777—d. 1842), the favourite of the Prince of Wales, afterwards George IV.; lived at 13, Berkely-square; also in Manchester-house, Manchester-square, and in St. Dunstan's-villa, Regent's-park. He died in Dorchester-house, Park-lane.
- Hertford, Charlotte, Countess of (of Thompson's "Spring"), lived in Lower Grosvenor-street.
- Hervey, John, ancestor of the Bristol family; lived in No. 6, St. James's-square, now Bristol-house.
- Harvey, Lady (Molly Lepel), lived in St. James's-place, St. James's-square, in a house with five windows in a row, fronting the Green-park.
- Hewer, William, Pepys's friend, lived in (No. —?) Buckingham-street, Strand.
- Hickes, Dr. (b. 1642—d. 1715), author of the "Thesaurus;" Vicar of All Hallow's, Barking, between the years 1680 and 1686. He lived in Great Ormond-street, Red Lion-fields, Bloomsbury, and is buried at St. Margaret's, Westminster.
- Hill, Aaron (b. 1684—d. 1749-50), was born in a house on the site of Beaufort-buildings, Strand, and lived in Petty-terrace, Westminster, now York-street.
- Hill, Rowland, Lord (b. 1772—d. 1842), the hero of Almaraz, lived in the villa at the south-west corner of Belgrave-square, and also in a house pleasantly situated in the fields at Paddington.
- Hill, Thomas (d. 1840), the patron of Bloomfield, originally a drysalter. He was the "Hull" of W. Booth's novel, and the supposed original of Paul Pry. He lived for many years, and died, in the second story of No. 2, James-street, Adelphi.
- Hilliard, Nicholas (b. 1547—d. 1619), miniature painter to Queen Elizabeth, whose portrait he took several times. Buried at St. Martin's-in-the-Fields.
- Hoadley, Dr. Benjamin (b. 1705—d. 1757), physician, and son of Bishop Hoadley, author of "The Suspicious Husband;" lived in a house in Chelsea, adjoining Cremorne-house.
- Hoadley, Benjamin, Bishop of Winchester (b. 1676—d. 1761), celebrated for his sermons on the inveterate errors of the clergy, which produced the celebrated Bangorian controversy. He died in the bishop's palace in Cheyne-walk, Chelsea.
- Hobbes, Thomas, of Malmesbury (b. 1588—d. 1679), a writer and poet. He lived in a house in Fetter-lane, Holborn. Two portraits of him hang at the Royal Society.
- Hogarth, William (b. 1697—d. 1764), painter, born in the parish of St. Martin, Ludgate, baptised at St. Bartholomew-the-Great, West Smithfield. He was apprenticed to Ellis Gamble, the goldsmith, at the "Golden Angel," in Cranbourne-alley, to learn the art of silver-plate engraving. Was a member of the Artists' Club, which held its meetings at the "Bull's Head," Clare-market. Married on the 23rd March, 1720, to Jane Thornhill, at the parish church of Paddington. He lived in 1733 to 1756 at (No. —?), Leicester-square. His father kept a school in Ship-court, three doors from Newgate-street, on the west side.
- Hogg, James (b. 1772—d. 1835), the Ettrick Shepherd; lodged, during his only visit to London, in 1831, on the second floor of No. 11, Waterloo-place, Pall-mall, looking into Charles-street.
- Holbein, Hans (b. 1497—d. 1554), painter; lived in Sir Thomas More's house, in Chelsea, for three years; is supposed to have been buried in St. Catherine Cree, or Christ Church, Leadenhall-street.
- Holland, Lord (temp. Charles II.), lived in Charles-street, St. James's-square, also in Newport-street, Long-acre.
- Hollar, Wenceslaus (b. 1607—d. 1677), an engraver of views and portraits; lodged at the Arundel-house, Strand, also close to Clement's-inn, Strand. He died in Gardeners'-lane, Westminster, between King-street, and Duke-street, and was buried in St. Margaret's, Westminster.
- Holles, Denzell, Lord (d. 1679), patriot and statesman; lived, in 1664, in the Piazza, Covent-garden, under the name of Colonel Holles, and, in 1666, in a house on the site of Evans's Hotel.
- Holt, Sir John (b. 1642—d. 1709), Lord Chief-Justice, died at Bedford-row, then called Bedford-walk.
- Hood, Samuel (b. 1754—d. 1816), first Viscount, Admiral; lived in No. 12, Wimpole-street.
- Hood, Thomas (b. 1791—d. 1845), the celebrated poet and wit; born at No. 31, Poultry, where his father had a bookseller's shop; buried in Kensall-green Cemetery, Harrow-road.
- Hook, Theodore (b. 1788—d. 1841), novelist; was born in No. 3, Charlotte-street, Bloomsbury (now Bloomsbury-street). No. 54, Berner's-street, was the scene of his famous "Berner's-street Hoax." This consisted in sending about two hundred orders to different of tradesmen to deliver almost every description of goods to a Mrs. Tottenham, at the same house.
- Hools, John (b. 1727—d. 1803), a poet and translator of considerable reputation; lived in Hudson's-house, in Great Queen-street, Lincoln's-inn-fields; was a clerk in the East India-house.
- Hoppner, John, R.A. (b. 1759—d. 1810), portrait painter, and rival of Lawrence; died at No. 13, Charles-street, St. James's-square, and lies buried in the cemetery of St. James's chapel, Hampstead.
- Houblon, Sir John (d. 1711), first Governor of the Bank of England; his house and garden occupied the site of the present Bank-buildings.
- Howard of Effingham, Charles Lord (b. 1536—d. 1624), was the Lord Admiral against the Spanish Armada in Queen Elizabeth's reign; lived in King-street, Westminster.
- Howard, John (b. 1726—d. 1790), the philanthropist. Was born at Hackney; his father was an upholsterer, in Long-lane, West Smithfield. He was apprenticed to a wholesale grocer in Watling-street; lived in lodgings kept by Mrs. S. Lardeau, in Stoke Newington. A monument is erected to him in St. Paul's Cathedral.
- Howard, Sir Philip (temp. Charles II.), commanded the "Queen's Troop." Lived in (No. —?) Suffolk-street, Haymarket.
- Howe, John (b. 1630—d. 1705), the Nonconformist, lies buried in Allhallows', Bread-street.
- Howe, Richard (b. 1725—d. 1799), the Admiral who defeated the French off Ushant; was also First Lord of the Admiralty; lived and died in No. 11, Grafton-street, Bond-street. A monument is erected to him in St. Paul's Cathedral.
- Howell, James (d. 1666), a political and historical writer; was confined in the Fleet Prison. He lies buried in the Temple.
- Hoyle, Edmund (b. 1672—d. 1767); author of a treatise on whist and quadrille; died in Welbeck-street, Cavendish-square; and lies buried in the cemetery in Paddington-street.
- Hudson, George, the Railway King, purchased the lofty house on the east side of Albert-gate.
- Hudson, Thomas (b. 1701—d. 1779), painter. He had Sir J. Reynolds for a pupil. He lived at Nos. 55 and 56, Great Queen-street, Lincoln's-inn-fields, then one house.
- Hume, David (b. 1711—d. 1776), the celebrated his-

- torian and philosopher; was a member of Brookes's Club, St. James's-street.
- Hungerford, Sir Edward (temp. Charles II.), lived in Spring-gardens, after his removal from the house on the site of Hungerford-market.
- Hunsdon, Henry Carey, Lord (b. 1524—d. 1596). He was Queen Elizabeth's cousin, and Lord Chamberlain; lived in the chief house in the Friary, Blackfriars; also in Somerset-house.
- Hunt, Leigh (b. 1784), was educated at Christ's Hospital, and had the rank of Deputy Grecian; was confined for two years in Horsemonger-lane Gaol, for a libel against the Prince Regent in 1812-14.
- Hunter, John (b. 1728—d. 1793), an eminent surgeon; presented his anatomical collection to the Royal College of Surgeons; it is still called the Hunterian collection. He lived, and had his museum in Leicester-square, one of the houses about the middle, on the eastern side. He died suddenly in St. George's Hospital, and is buried in St. Martin's-in-the-Fields. A portrait of him, by Sir Joshua Reynolds, hangs in the Royal College of Surgeons.
- Huskinson, William, M.P. (b. 1770—d. 1830), statesman; killed at the opening of the Manchester and Liverpool Railway. A statue is erected to him at Lloyd's.
- Hyde, Edward, Earl of Clarendon (b. 1608—d. 1774), Chancellor, and author of "The History of the Rebellion in the time of Charles I.," called the great Lord Chancellor of human nature; lived in Berkshire-house, St. James's, for a short time after the fire; also in Worcester-house, Strand, and in Clarendon-house, Piccadilly, which he built for himself; was a member of the Middle Temple. He was married at St. Margaret's, Westminster, to Francis Aylesbury, the grandmother of Queen Mary and Queen Ann. He died in banishment, and is buried in Westminster Abbey.
- Hyde, Henry, Lord Clarendon (d. 1709), Lord Cornbury afterwards; lived in Clarendon-house, Piccadilly, and in St. James's-square.
- Hyde, Lawrence, Earl of Rochester (d. 1711), second son of the great Lord Clarendon. Stated that Clarendon-house, built by his father, was the cause of his fall, owing to the envy it drew upon him. Lived in St. James's-square.
- Inchbald, Elizabeth (b. 1756—d. 1821), a celebrated actress, and authoress, amongst other works, of "A Simple Story." She lived in one room on the second floor at (No. —?) Frith-street, Soho; she died at the Roman Catholic boarding establishment, Kensington-house, Kensington. Her portrait hangs at the Garrick Club.
- Incedon, Charles (b. 1756—d. 1826), a celebrated vocalist; one of the best singers of English national songs. He died at No. 13, Brompton-crescent.
- Jackson, John, R.A. (b. 1778—d. 1831), painter; buried in the cemetery of St. John's-wood Chapel.
- Jacob, Lady (temp. James I.), wife of Christopher Brooke, the poet; lived in (No. —?) Drury-lane.
- Jacobson, Theodore (d. 1772), architect; designed the Foundling Hospital. He is buried in All-Hallows-the-Great Church.
- Jaggard, John (temp. James I.), the printer; lived in (No. —?) Fleet-street.
- Jansen, Cornelius (b. 1590—d. 1665), the painter; lived in Blackfriars, and had a good deal of business.
- Jansen, Sir Theodore (temp. George I.), was a director of the South Sea Bubble; his property in Queen-square, Westminster, was seized in consequence. He was one of the first inhabitants of Hanover-square.
- Jarman, Edward (d. 1666), architect and City surveyor; built the present Drapers' Hall, the second Royal Exchange, the Fishmongers' Hall, and the Merchant Taylors' Hall.
- Jefferies, George (d. 1689), Lord Baron Wern, commonly called Judge Jefferies. He lived in a large brick house north of Storey's-gate, St. James's-park; was captured at Wapping when trying to escape from London after the death of King James. He was imprisoned in the Tower, and lies buried in St. Mary, Aldermanbury.
- Jenner, Edward, M.D. (b. 1749—d. 1823), the discoverer of vaccine inoculation; lived at No. 14, Hertford-street, Mayfair.
- Jermyn, Henry, Lord Dover (d. 1708); lived in Dover-street, Piccadilly, and in Piccadilly.
- Jorvas, Charles (b. 1675—d. 1739), a painter and writer. He is immortalised by Pope's friendship and panegyric. He lived in Cleveland-court, St. James's.
- John, King of France (d. 1364), imprisoned in the Savoy, and also in the Tower of London. He died while on a visit to this country, shortly after his release, in his former prison, the Savoy.
- John of Gaunt (d. 1399); he died in Ely-place, Holborn. A stately tomb stood to his memory in old St. Paul's.
- Johnson, Gerard, the sculptor, who made the monumental bust and tomb of Shakespeare at Stratford-upon-Avon. He was a Hollander, and lived in the parish of St. Thomas-the-Apostle.
- Johnson, Dr. Samuel (b. 1709—d. 1784). His first London lodgings were in (No. —?), Exeter-street, Strand, at a staymaker's, named Norris. In 1737 he lived in (No. —?), Woodstock-street, Hanover-square; in 1748 at the "Golden Anchor," Holborn-bars; in 1760-61 at (No. —?), Inner Temple-lane, Fleet-street; in 1769 at (No. —?), Johnson's-court, Fleet-street; also at the corner house on the west side of Bow-street, Covent-garden, formerly Will's coffeehouse; at No. 6, Castle-street, Oxford-market; and, finally, from 1777 to his death, at No. 8, Bolt-court, Fleet-street, on the right-hand side. He made a speech on the subject of mechanics in the great room of the Society of Arts. At No. 40, Essex-street, Strand, he established an evening club in 1783, occasionally called Sam's. At the "Turk's Head," in Gerard-street, he and Sir J. Reynolds established the Literary Club, in 1784. It was first called "The Club." He was also a member of a club held at the "King's Head," Ivy-lane, Newgate-street. He attended St. Clement Dances, Strand. His pew is still pointed out. Occasionally supped at the "Crown and Anchor" Tavern, in the Strand, now the Whittington Club, and here he quarrelled with Percy about old Dr. Mounsey. Compiled a great part of his dictionary in No. 17, Gough-square, Fleet-street, in the garret of the house in the north-west corner. The "Mitre" Tavern, Mitre-court, Fleet-street, was a sort of rendezvous for him and his friends. There he drank his bottle of port and kept late hours. Sat for his bust to Nollekens, the sculptor, at No. 9, Mortimer-street, Cavendish-square. A portrait of him hangs in the Privy-garden collection, by Sir J. Reynolds. He lies buried in Westminster Abbey, and a monument is erected to him in St. Paul's Cathedral.
- Jones, Inigo (b. 1573—d. 1652), baptized at St. Bartholomew-the-Less, Farringdon-without. He buried his money in Lambeth-marsh during the great civil war. Erected a monument to his friend G. Chapman, the translator of Homer, in St. Giles-in-the-Fields, which is still standing. Lived in Scotland-yard, Whitehall, and died in Somerset-house. Was buried in St. Bennet, Paul's-wharf. He designed and built the following places:—Thanet-house, Aldersgate-street; Ashburnham-house, Little Dean's-yard; Barber Surgeon's Hall, Monkwell-street, City; the gateway to Beaufort-house, Chelsea, removed to Chiswick, where it now stands; the water gate at the bottom of Buckingham-street, Strand; the stone gateway now in the grounds of Holland-house; Lincoln's-inn Chapel; part of Lincoln's-inn-fields; Lindsey-house, Lincoln's-inn-fields; the portico to old St. Paul's; St. Paul's, Covent-garden; the Piazza, Covent-garden. the Banqueting-house, Whitehall, and some considerable of St. Alban's, Wood-street; Bedford-house, Bloomsbury; St. Catherine Cree, or Christ Church, Aldgate.

Jones, Sir William (b. 1746—d. 1797), a Judge of the Supreme Court in Bengal; a poet and Oriental scholar. Lived in South Audley-street, Grosvenor-square (house opposite Audley-square), and also had chambers in Lamb's-buildings, Temple. A statue has been erected to him in St. Paul's Cathedral.

Jones, —, a clock-maker; the first barometer seller in London; had a shop in Inner Temple-lane, Fleet-st.

Jonson, Ben (b. 1574—d. 1639), poet. Educated at Westminster School. Lived in Blackfriars in 1607; also in Hartshorne-lane, near Charing-cross. He is buried, and a monument is erected to his memory, in Westminster Abbey. His "Bartholomew Fair" was first acted at the Hope Theatre, Bankside, Southwark. When young he served as a bricklayer, and assisted in building Lincoln's Inn.

Jordan, Dorothy (b. 1762—d. 1816), actress; lived at 3, now 30, Cadogan-place, Sloane-street, third door from Pont-street.

Kean, Edmund (b. 1787—d. 1838), tragedian. Lived at No. 12, Clarges-street, Piccadilly, from 1816—24.

Keats, John (b. 1796—d. 1821), poet; was born at the "Swan and Hoop" livery stables, No. 28, on the Pavement in Moorfields; lived at "Queen's Arms Tavern," No. 71, Cheapside.

Keith, George, Viscount (b. 1746—d. 1823), the Admiral who captured the Cape of Good Hope from the Dutch in 1795; lived in No. 46, Harley-street, Cavendish-square.

Kemble, John Philip (b. 1757—d. 1823), a celebrated actor. He suggested the building of Dulwich Picture Gallery. He lived at 89, Great Russell-street, Bloomsbury, a house which was pulled down to make way for the eastern wing of the British Museum. A portrait of him hangs at the Garrick Club, and there is a statue of him in Westminster Abbey.

Kenneth, White (b. 1660—d. 1778), Bishop of Peterborough; author of "Kenneth's Register," &c., lived and died in St. James's-place, St. James's-square.

Kent, William (b. 1684—d. 1748), architect; built the Earl of Yarborough's house, in Arlington-square, Piccadilly, also Devonshire-house, Piccadilly.

Kenyon-Lloyd, Lord (b. 1733—d. 1802), Lord Chief-Justice; lived at No. 35, Lincoln's-inn-fields.

Killgrew, Thomas (b. 1611—d. 1682), poet and wit; lived in the north-west angle of the Piazza, Covent-garden, from 1637 to 1643. He lies buried in Westminster Abbey.

Kilmarnock, William Boyd, Earl of (b. 1702—1746), one of the rebel lords of 1745; lived in Rathbone-place, Oxford-street; tried at Westminster-hall, imprisoned in the Tower, and executed on Tower-hill, and is buried in the church of St. Peter's *ad vincula*.

Kip, John (d. 1722), the engraver of so many old palaces and seats in England; lived and died in a place called Long-ditch, Westminster.

Kitchiner, Dr. William, a physician and author; his "Cook's Oracle" had an enormous circulation; lived and died at (No. —?) Warren-street, Fitzroy-square.

Kneller, Sir Godfrey b. 1648—1726) an eminent painter; lived in the Piazza, Covent-garden, in a house near the recess leading into Covent-garden Theatre, also in Great Queen-street, Lincoln's-inn-fields, in a house next to Dr. Radcliff's. A monument is erected to him in Westminster Abbey.

Knight, Mrs., singer to Charles II.; lived at the south side, west end of Pall-mall, in 1671.

Knox, Vicesimus b. 1762—1821), a learned divine and essayist, was educated as Merchant Taylors', and afterwards curate of St. Dunstan's-in-the-East.

Kynaston, Edward (d. 1712), the actor of female characters; lived at (No. —?) Bedford-street, Strand; buried at St. Paul's, Covent-garden.

Kynaston, Sir Francis, the poet, lived in Covent-garden in 1636 "on the east side of the street, towards Berrie," and in 1637, on the west side of Bedford-street, Strand.

Proceedings of Institutions.

BIRKBECK INSTITUTION (LATE LONDON MECHANICS' INSTITUTION).—The prizes and certificates obtained at the last Examinations of the Society of Arts and of the Metropolitan Association, together with the Institution prizes, were presented to the successful competitors on Tuesday evening, October 29th. Earl Russell presided, and distributed the awards to the male competitors, the female candidates receiving theirs from the hands of the Countess Russell, including the Princess of Wales' prize of the Metropolitan Association. The taker of the highest prize offered by the Birkbeck Institution (including the lady's scholarship) to ladies was Miss Styles, who also took other honours; and one young lady—Miss Hudson—took two prizes for excellence in book-keeping. The Hon. Geo. Denman M.P., moved, and Alderman Cotton seconded:—"That the thanks of this meeting be given to the Society of Arts for the earnest and successful manner in which it has encouraged arts, manufactures, and commerce throughout its long existence, especially for the valuable aid which it has given, by means of its excellent system of examinations, to the improvement and the extension of evening education. That the thanks of this meeting be also given to the Metropolitan Association for the great work which it has already effected in the promotion of the education of adults, and for the many encouragements it offers to students." Mr. W. G. Larkins, secretary of the Metropolitan Association, and visiting officer of the Society of Arts, responded, and called attention to the enlargement of the Programme of Examinations for next year, and the increase in the number and value of the prizes. Earl Russell delivered an address on the benefits of education; and other speeches were made, including addresses from Mr. Hughes, M.P., Serjeant Parry, Dr. Morrell, Professor Hughes, Professor Huxley, the Hon. Dudley Campbell, Mr. G. M. Norris, and Mr. W. L. Birkbeck.

UNION OF LANCASHIRE AND CHESHIRE INSTITUTES.—The report presented at the annual meeting, held on the 12th October, says that the results of the past year's operations were in the highest measure satisfactory, both because of their intrinsic value and because of the illustration and enforcement they lent to the theoretic basis upon which the union is founded, and to the practical procedure by which its principles had been sought to be realised. At present there are 121 institutes in union, of which twelve have been admitted during the last year. The following is a summary from 84 institutes:—Number of members, 23,784; female members, 4,157; members attending elementary evening classes (last winter), 8,060; attending government science classes, 1,941; volumes in library, 137,121; income (66 institutes), £14,084. The following are fundamental qualities of the union:—Systematic class instruction, graduated examination scheme, periodic visitation, and a comprehensive prize scheme. By constant regard to class-work, the condition of which had been with them the test of the condition of the institute itself, the council had obtained real success in carrying forward elementary instruction—which, in all respects, was their first anxiety. In this department (class instruction) the labours of the visiting agent (Mr. Lawton) had proved of the greatest possible service. The reliance of the council on the notion of a graduated scheme of examination has been justified by results. By it they had been enabled to ascertain to a considerable extent the actual state of the mental faculties of the students, their relative condition of growth, with their especial features of strength and weakness. Upon the subject of elementary examination the council accept as a truth, both of principle and experience, that a substantial approximation to universality in elementary instruction is a fundamental and indispensable condition of higher education and true progress. At the elementary examination held in February last,

477 certificates were granted—130 of the higher grade, 347 of the lower—as against 378 certificates in the year preceding, and 171 in 1865. Of these, the highest number for any one place this year, namely, 47, were obtained by Droylsden, and the next highest number, 22, by the Mechanics' Institution at Burnley. Of certificates of the higher grade, the two most successful institutions were Macclesfield Useful Knowledge Society, 13, and Oldham Lyceum, 12. The final examination of the Society of Arts was held in April last. Candidates were sent in by 40 institutes, of which 31 are in direct connection with the Society of Arts. Nine institutes sent in candidates for the first time, 379 certificates were obtained by the union, against 272 in 1866, 281 in 1865, and 247 in 1864. Of these certificates 77 were awarded to students belonging to the Manchester Mechanics' Institution, 44 to the Salford Working Men's College, 30 to the Oldham Lyceum and Science School, and 22 to the Liverpool Institute. At 35 institutes science classes in connection with the Department of Science and Art have been in operation during the year. At the examination in May last 1,014 certificates were granted, against 633 in 1866, 786 in 1865, and 518 in 1864. Here again the Manchester Mechanics' Institution and the Oldham Science School stood well, having gained 156 and 116 certificates respectively. Bolton was the next highest centre of honour, 52 students from the Mechanics' Institution and 69 from the School of Science in that town having gained certificates. The council, by instituting examinations in special subjects, and providing prizes in connection with them, had in view the higher education of those who should have secured for themselves a systematic and progressive training in the elementary stages of instruction. The subjects of the special examination are, in general, such as relate to the scientific principles of the art of production, or to the phenomena involved in the relations of capital, skill, and industry. In the matter of technical education, the supporters of the union might look back upon the work of the last three years with great satisfaction. The council had earnestly endeavoured to put the Government provision for scientific instruction to the highest use. They have organised science classes upon a systematic plan, so as to concentrate and apply with the greatest economy and effect all the available teaching power. Of 6,552 students in the Government science classes for 1866-7, 1,930 belonged to Lancashire, and 229 to Cheshire. Nearly one-third of the entire number, 1,712, attended evening science classes in the Lancashire institutes of the union. At the May examination 1,065 "results" were obtained by Lancashire candidates, of which number 600 were artisans, excluding clerks and bookkeepers. The council express their strong conviction that any system of technical education adequate to the demands of the time, and the needs of the nation on the one hand must secure for the artisan-student a theoretic knowledge both of the nature and qualities of the raw materials upon which he operates, and of the means and methods of its transmutation into objects and forms of use and beauty; and on the other must give him the opportunity of becoming thoroughly master of the entire body of rules by which the practical results of the theoretic knowledge in both its departments are most conveniently and compendiously expressed. The council, after remarking upon the importance of female education, call attention to the special provision for the purpose furnished by the Society of Arts. In April last thirteen females presented themselves for examination, and obtained certificates. It is hoped that the example of their success will encourage others. The council referred with regret to the deaths of three of the vice-presidents of the union—the late Mr. J. A. Turner, Mr. James Shanks, and Mr. Edmund Buckley. The balance-sheet of the year's accounts showed that the receipts during the past twelve months were £431 19s. 2d., and that there is a small balance in hand.—The visiting agent (Mr. Lawton reported that he had inspected the

elementary evening classes of 60 institutes, conferred with officers and committees of 36 institutes, and had delivered 38 lectures. There had been a steady increase in the number of classes for special instruction in science. He urged upon committees the great importance of establishing a science class for females, especially on the subject of animal physiology. It was gratifying to notice that, whilst in May there was not one female candidate in Lancashire and Cheshire, and at the November examination for teacher certificates there were only two, yet at the April examination of the Society of Arts, 13 female candidates obtained certificates. Some of the institutes in particular districts had suffered severely on account of the members having to work overtime.

CULTIVATION OF SILK.—THE *BOMBYX CYNTHIA*.

The following extracts from a correspondence between Mr. LeNeve Foster, the Secretary, and Mr. Harry Chester, a Vice-President, of the Society of Arts, may be interesting not only to our correspondents in the Bahamas, but to the readers of the *Journal* in other places:—

Extract from a Letter to the Secretary from Mr. Harry Chester, dated the 14th October, 1867.

"Some of my friends at Nassau, Bahamas, among whom are the Governor and the wife of the Bishop of Nassau, have requested me to see what can be done in London to help them in a project, which the principal inhabitants of the Bahamas have formed, 'to develop the resources of the colony,' and particularly to introduce there the cultivation of silk. They conceive that, as the castor-oil plant, *Ricinus communis*, grows there as an abundant weed, the best silkworm they could introduce would be the *Bombyx ricini*, or *Bombyx cynthia*, which is known in Assam as the *Eria*; and I am asked whether we can give them any information on this subject, and assist them in procuring the worm."

Extract from a Letter to Mr. Harry Chester from Mr. Le Neve Foster, dated the 16th October, 1867.

"In the Society's *Journals* of the 24th February, 2d March, 14th July, and 10th November, 1854, and in those of the 10th August, 1855, 5th February and 4th June, 1856, and 9th September, 1859, all of which I will forward to Nassau, a good deal of information is given respecting the so-called silkworm, which feeds on the leaves of the *Ricinus communis*. I am afraid that our friends in the Bahamas may be disappointed of their hopes of a favourable result in this direction. The product of the worm is not silk of the same quality or character as that of the *Bombyx mori*, or mulberry worm, and can never take the place of the latter, and will not compete in the market with it. The former material may be useful for certain purposes, and in certain climates. There are no markets for the article; they would have to be created if it is to exist at all as an article of commerce. From the nature of the cocoon, the so-called silk is not suited for reeling; the cocoons must be carded and spun into thread before it is woven. The fabric produced is rough and without lustre. A material very similar, I might almost say identical, is used in India, and is sometimes sold in our shops here under the title of Tusser or Tusash cloth. It is a good and useful material, of no beauty, but well adapted for clothing next the skin in hot countries.

"I may add, that the difficulty which necessitates a treatment of the cocoon of this worm different from that applied to the cocoon of the mulberry worm is a natural one. The cocoon of the mulberry worm is alike all over, and the thread, when reeled, runs off, from the beginning to the end, of an even quality, and the moth is killed before he makes his exit, otherwise he would destroy the cocoon. In the case of the castor worm the

cocoon is spun with a hole left for the exit of the moth, which escapes without injuring the cocoon, but in forming this exit hole the thread, whenever it approaches it, is of a rough and weak character like the rough and fuzzy stuff which envelops the ordinary cocoons. Hence, the thread is not only apt to break whenever it comes near this exit, but it is of a rough and uneven character; and even if by great care it is reeled, as has no doubt been done, the thread is of little value owing to the above defects. Hence it is found best to card and spin a thread as from so much cotton wool."

Extract from letter to Mr. Foster from Mr. Harry Chester, dated the 24th October, 1867.

"Having read not only your letters but the *Journals* to which you referred me, I confess that there is a good deal of discouragement in the various reports. At Malta, where Sir William Reid, when Governor, took the greatest pains, with the greatest intelligence, to establish this manufacture, it appears to have entirely failed; and I understand you to say that you know, on trustworthy information, that it is a confessed failure. The German anticipations of success were certainly magnificent, but it does not appear that they ever reached beyond the stage of anticipation. Do you know anything of the results of the experiment made in Grenada, or at Turin, or elsewhere in Italy?"

Extract of Letter to Mr. Harry Chester from Mr. Foster, dated the 25th October, 1867.

"I have no particular information of the failure of *Bombyx ricini* in Italy or Grenada; but the absence of any information of success is almost as significant. People will seldom take the trouble to record their failures, though sometimes they are ready enough to relate their successes, even before they have been secured. The non appearance of the material in our markets is, moreover, I fear, a sufficient indication that it has not been produced, at least in marketable quantities."

Extract of Letter to Mr. Foster from Mr. Harry Chester dated 26th Oct., 1867.

"The presumptions are certainly unfavourable to the poor *Bombyx ricini*; but, though it may not have succeeded at Malta, in Germany, or in Italy, or even in Grenada, it might be worth while to try it in the Bahamas; and it would certainly be worth while to obtain a little more information about it.

"The castor oil plant is stated to be a common and vigorous weed in the Bahamas. It was not a native of Malta, nor of any part of Germany, and does not flourish strongly in the latitude of North Italy. The castor oil worm is singularly prolific, or rather it produces six or eight broods in the year, and does not destroy the cocoon in escaping from it with its own life. The produce, though, as you say, not the beautiful and high-priced silk of the mulberry worm, is far more durable; and, if it could be brought to market in sufficient quantities, would certainly command a price either as a cheap substitute for the more costly silks, or as a material useful to be worked up with silk, or wool, or cotton.

"I suggest that application should be made to the foreign, colonial, and Indian offices for such information as they can obtain for us respecting the management of the insect, and the treatment of the cocoons, and the manufacture of their products in Assam and other parts of India, in the colonies, and elsewhere."

PARIS EXHIBITION.

Our last notes on the Exhibition referred to the foreign portions of the second group, or applied art. We now propose to say a few words on the next group, which

includes under the title of furniture all the articles used in dwellings. Here we see the products or effects of applied art in one of their most extensive phases, and it is satisfactory to note that in most of the classes there are undoubted signs of progress in the right direction. The French section is far too crowded, and contains a vast amount of objects which have little novelty to recommend them, but the best examples to be found there deserve and have obtained great attention; the glaring white and gold furniture, and the tortuous forms of the Louis XV. and Louis XVI. styles have almost disappeared, and in their place we find pure forms, not overloaded with decoration but sparingly relieved by a small amount of exquisite ornamentation. The most remarkable specimens of fine furniture work are book-cases and cabinets, in oak and ebony, enriched with carving, and frequently also with *lapis lazuli* and other hard stones. Many of these productions are equal to those of any age or country, admirable in design and perfect in execution, and we are glad to find that the South Kensington Museum has secured some good examples for the education of our own students in applied art. Paperhangings naturally follow furniture, and accordingly we find the best specimens of this beautiful manufacture, remarkable, not for extreme elaboration, as they were a few years since, but for purity and simplicity of design and sobriety of colour; the more elaborate and showy patterns are mostly founded on Chinese, Japanese, and old stamped leather models, and many of these are very beautiful. The same remarks will apply generally to furniture stuffs, while the new patterns of the unglazed chintzes now in vogue exhibit great excellence in design and colour. In marble and stone work we see without regret an almost total absence of the old heavy ormolu decoration, which, with its companion buhl work, seems almost extinct. Where gold and colour are introduced they are used judiciously, and as essential portions of the design, not as additional decoration. The metal branches show quite as much progress as the former; in the best articles the ornamentation is at once more sparingly and more effectively introduced; iron, copper, and lead are now decorated as they were in the best days of applied art, by means of the punch and the hammer, and many of the examples of casting are shown as they came from the moulds, and evince an amount of care in their production which is beyond all praise. The forms of the best works in iron, bronze, or other metal work are greatly improved, and the application of bold incised enamel work is becoming a remarkable feature in this class of productions.

The above remarks apply to first-class work; as regards the rest, it must be admitted that there is far more elaboration than taste, and far more ornament than effect. Here and there cheapness is obtained by simple means, with utility and elegance for the result; but generally the lower classes of French decorative work offer more warnings than examples.

The glass department is conspicuous for the size and mass of its contents; the specimens of plate glass are remarkably large, and fine in colour, while the large crystal work, chandeliers, candelabra, and lustres are generally over elaborate in design, and not of good colour. As regards table-glass, the French make three sorts—crystal, demi-crystal, and ordinary glass; with respect to form and colour, their productions are generally inferior to those of England, and the same amount of art does not appear in the decoration that is to be found in other classes of manufacture. In the intermediate kind of glass, the demi-crystal, which is not produced in England, the simplicity of the forms, and the extreme cheapness of the articles, invite the careful study and imitation of our manufacturers.

Perhaps in no branch of decorative work is there less apparent progress than in the manufactures of Sèvres; the exhibition of porcelain is very fine, but there is little of novelty or improvement either in the

taste of execution of the ornamental portions, except that elaborate compositions have almost entirely disappeared from dessert services and other ware, on which they were certainly out of place. The principal novelty in decoration is the production of ornaments in relief, by the super-position of one kind of material upon another, but it is generally admitted that the English potters exhibit in this kind of work quite as much, if not more, ability than their rivals. If the highest class of decorative porcelain exhibit no special progress, it is impossible to speak too highly of the commoner kinds of china, and especially of the beautiful white Sèvres, Limousin, and other ware; the body, glaze, and forms of these wares are all admirable, and some of the large specimens, especially a white vase, at least ten or twelve feet high, are marvels of ceramic workmanship.

It is in the collection of *faïences* that we must look for the progress which has taken place in the production of decorative ware in France during the last few years, and this progress is not only great but in the right direction. The potters commenced by copying the works of Palissy and the great Italian and other potters, as well as the productions of China, Japan, and Persia, and they have produced some very remarkable works in this way, but of late an entirely new style of decoration has arisen, artists of eminence have studied the conditions of the manufacture, and, throwing aside all conventional rules, have produced, especially on medallions and slabs, a large amount of exquisite work, simple in treatment and brilliant in colouring. No compartment in the whole exhibition does France higher credit than that which contains her *faïences*, and when we consider that England is making rapid progress in the same direction, we have a right to expect great results during the next few years; but no one interested in this class of production should fail to study the treatment of the best French ceramic artists.

The show of gold, silver, and gilt ware is very large, but cannot be said to exhibit any remarkable progress in art; in fact, the absence of real art here is painfully apparent; the greater portion of the plate is remarkable for over-elaborate decoration and want of fitness in design, while there is an almost entire absence of those exquisite caskets and ornamental works which we were accustomed to a few years since. Amongst the few novelties are some very charming applications of the Chinese system of enamelling—but whether *cloisonné* or incised we are unable to say—and some beautiful translucent enamels. M. Lepece exhibits a very remarkable collection of the latter kind, which has won for him not only high honours but universal attention; his colours, if not always quite harmonious, are extremely brilliant and varied, and his exhibition marks a positive step towards the revival of this beautiful art.

The Prussian department contains a fine collection of china and decorative earthenware in old styles, while the newer kinds are not remarkable for excellence either in design or colour, and the table ware is generally imitated from French or English forms. The glory of the Prussian section of this group is the collection of fine iron and other castings which is completely without a rival; these beautiful reproductions will almost bear microscopic examination, and if any reproduction could equal an original work, the Berlin shields and tazze would do so. The Prussian carpets also show great improvement in design and harmony of colour.

The Austrian court makes a brilliant show; the coloured Bohemian and Viennese glass is very fine, and the plain table glass vies with that of France and England, but the decorations of the finer kinds of glass are in the old cut style. The show of table china is good, but French in its form and designs. Amongst the most remarkable productions are some very fine pieces of table glass mounted in fine gilt-work, gilt candelabra, and ornaments and imitative silver and steel work. In fabrics, the imitation Persian carpets, furniture

damasks, tapestry hangings, and table-covers, are remarkable.

The Russian Court in this, as in the other groups, has a special character of its own, and a very attractive one. The goldsmiths' work, real and imitative, is decorated in niello and other work with great taste and skill; and the forms being essentially eastern in their origin, offer a pleasing variety, and the same remarks apply to the decorated earthenware, specimens of which have been secured for our art schools. The gem of the court, however, is the grand specimen of mosaic-work, representing a group of the Saints of the Greek Church, one of the finest modern mosaics produced.

The Italian court is also remarkable for mosaics, Signor Salviati, of Venice, making a splendid show of copies of the *chefs-d'œuvre*; we are unaware how much Russian mosaics owe to foreign aid, but there can be no doubt about the origin of the Salviati mosaics, which are admirable examples of the resuscitation of a fine old art in the place of its birth. Italian art shows well, and holds out promise for the future; her sculpture forms one of the most attractive features of the Exhibition, and the group with which we are now engaged is rich in Florentine ware in the old style, coloured and decorated Venetian glass, and Florentine mosaic and inlaid work, and daring carvings in hard stone, such as porphyry vases, covered with flowers, which force our admiration, in spite of all the rules of art and questions of fitness.

The collection of decorative works from the East is large and fine, but presents little novelty. The Persian carpets, which are here seen in large numbers, have attracted great and deserved attention; for design, colour, and perfection of workmanship they still surpass all that Europe can produce, great as the improvement has been in the latter, especially during the last few years. It is pleasing to note the excellent effect of the study of these and similar fabrics in the carpets exhibited in the English section, which have called forth great admiration; the jury has marked its appreciation by awarding two gold medals for carpets to great Britain—one to Kidderminster, the other to Glasgow, France only receiving the like number, Austria but one, and no other nation of Western Europe so high a distinction. Few classes show so much progress as the carpet manufacture in point of design and harmony of colour, and this is fortunate, especially for England, where the carpet plays so large a part in the general effect of a room.

OPENING OF THE GREAT CENTRAL CATTLE MARKET OF PARIS.

The large establishment created at La Villette, on the outskirts of Paris, for the sale and slaughter of animals used for food, has been described in the columns of the *Journal*. The abattoirs have been in operation for some time, and the cattle-market was opened on the 21st of October. The constructions completed to the present time consist of three immense halls, built much in the same manner as the great *halles centrales*, or market of Paris, at the east end of the Rue St. Honoré, that is to say, principally of corrugated iron and glass. The central hall is for horned cattle, that on the right hand for calves and pigs, and the other for sheep; near the halls are two large streams of water, with sloping sides, through which the cattle are driven and thus refreshed, and beyond are large laystalls and pens. The buildings were filled to overflowing on the first day, and the extension of the halls and laystalls, which has been provided for, is to be carried out forthwith. The present market will contain upwards of 40,000 animals of all kinds, and when the buildings are completed half as many again. The sales on the opening day amounted to 3,527 oxen, 467 cows, 250 calves, 13,997 sheep, 204 pigs; in all 18,516, of a total value of about £120,000. A considerable portion of the sheep came from Germany. The fees charged for standings are as follow:—Bulls, oxen, and cows,

2fr. 50c. per head; calves, 1fr.; pigs and sheep, 50c. each. These fees are charged each time that an animal is exposed for sale. The establishment includes an exchange, a bank, and a café restaurant and buffet now in course of completion. The dealers draw lots every morning for the places which they are to occupy in the halls. The markets are open every day in the week, but not on Sunday, and all the other cattle markets in Paris were closed when the new one was opened. The means of communication are admirable. The establishment stands close to the circular boulevard which lies round Paris, just within the fortifications, and has on one side a canal, and on the other the *Chemin de Fer de Ceinture*, which communicates with all the great lines of railway and all parts of the capital. This new establishment is certainly one of the most important and remarkable with which Paris has been endowed for many years.

STEAM-PLOUGHING IN FRANCE.

The experiments which have lately taken place at Petit-Bourg, under the auspices of an independent committee of agriculturists, have brought the systems of Howard and Fowler forcibly to the attention of French agriculturists, and cannot fail to be productive of important results. These trials are all the more important from the fact that they are not competitive, that there are no prizes to be given, and that every operation is watched, reported, and commented on by competent judges and witnesses; it is a practical exposition of facts before an experienced audience. The experiments are recorded, and the steam ploughs illustrated at length in the pages of an excellent and comparatively new publication, the *Journal de l'Agriculture*, founded and conducted by M. J. A. Barral. The deductions drawn from the experiments in question are naturally various, and in some measure contradictory, and the views taken by M. Gueyraud, an eminent agriculturist, will indicate the tenor of these opinions, and at the same time furnish matter for useful discussion. This gentleman objects to the conclusion that had been drawn by others, to the effect that the problem of steam ploughing was solved in the case of large farms and soils not encumbered with stones, but not in other cases; he expresses his conviction of the admirable working of both Fowler's and Howard's systems, and adds, that four years' experience of the latter has led him to a totally opposite conclusion to that stated above. He says:—"For all superficial operations, and in all soils free from stones and difficulties, ploughs, extirpators, and other implements drawn by animals give a more economical if not a more regular result than the steam plough. When the depth exceeds about ten inches, which would require the use of four horses at least, when the soil is dry and hard, in stony land in which the course of the implements is impeded, the steam plough is more economical, more effective, and more regular than implements drawn by animals, and the economy increases in geometrical ratio with the difficulties to be overcome.

Now, as middling-sized and small farms are cultivated to a greater depth, says M. Gueyraud, than large ones (and herein lies the secret of their crops), the former have more to gain from steam cultivation than the latter. It is true, he adds, that each small farmer could not afford to purchase a steam plough, but by uniting together they may obtain a machine which costs nothing while idle, whereas horses are doing nothing half the year, and eat every day. M. Gueyraud is further of opinion that the speed attempted with steam ploughs is too great; they generally try to achieve a yard per second, which is too rapid in stony ground, and causes shocks and irregularity in the work, while if the speed be reduced and the width and depth of the furrow increased, there is a positive gain both in regularity and economy. He recommends a speed of about twenty inches per second, and says he has found it most effective. "I must add," he says, "in favour of steam cultivation, that whereas the

practical value of traction by animals decreases with the difficulties to be surmounted and the number of animals required, that of a steam plough, on the contrary, increases with the difficulties to be overcome." Conclusions thus derived from long study and practical experience cannot fail to be valuable, if only in inducing serious consideration of the subject to which they refer.

Fine Arts.

MR. ROBERT GOWER, of Marseilles, whose collection of works of art made the Château de Repentance, near Aix, one of the most famous mansions in the south of France, has bequeathed his gallery, after the death of one person, to the town of Liverpool, on condition that a special gallery is erected to receive the collection, and allow of its being arranged in the same manner as it is at present. Should Liverpool decline the conditions, the same offer is then to be made to Manchester, Edinburgh, and, finally, to Newcastle; and in case of the refusal of all these towns, the collection is to be offered, on the same terms, to Dijon, Bordeaux, Aix, and Marseilles successively. Should all decline, then the gallery is to be disposed of by auction, and the interest of the proceeds to go to the deceased's nephew and his heirs.

GUSTAVE DORÉ.—It is given as a fact, on Doré's own authority, that by May, 1862, his published designs amounted to at least 44,000. No doubt, as the recorder of this astounding fact observes, designs of which the total is so enormous demand to be individually estimated by a standard somewhat different from what would be applied to works produced with greater effort and deliberation. We cannot condemn Doré's performances because they do not exhibit all the qualities of ripper art, unless, indeed, we go to the length of saying that such immediate outpourings are not allowable art at all. The fact that a painter and designer of twenty-nine had published 44,000 works, many of them of unusual size in their several classes, and crammed with figures and with every sort of scenic or accessory material, is certainly most extraordinary.

Commerce.

TRINIDAD ASPHALTUM.—Three varieties of this are shown at the Paris Exhibition. The Pitch Lake of Brea, one of the greatest curiosities of Trinidad, covers 100 acres, and yields inexhaustible supplies of asphalt, which, though largely sent to Europe and America, has not met with the attention it deserves. Lacquer pitch, found in the vicinity of the Pitch Lake, is recommended as an ingredient entering into the composition of dark-coloured varnishes. Its commercial value is great, but the supply is by no means ample. Larger quantities may possibly be obtained by deep sinking. The export of asphalt from Trinidad in 1865 was 17,700 tons, principally to Belgium, France, and England. One company in the island has entered into a contract to supply 1,500 tons yearly of asphalt, in blocks fit for paving, at nine dollars the ton, delivered on board. The same company has engaged to furnish a house at Antwerp with 20,000 tons at 50s. per ton, to extract oil from.

CONSUMPTION OF TOBACCO IN FRANCE.—The consumption of tobacco has increased enormously since 1709, when the produce of its sale was £1,200,000 sterling. In 1811 the revenue was only £640,000. After this it began to increase rapidly, and in 1815 the net revenue attained the sum of £1,280,000; in 1825, £1,760,000; in 1835 it went down to £1,240,000; in 1846 it reached the sum of £3,280,000; in 1855, to £4,520,000; and finally, in 1866, the sum of seven millions sterling. The quantity of tobacco sold in the year 1815 was 19,759,091 lbs., and at the present moment it amounts to 66 millions of lbs. yearly. From 46 to 49

millions of pounds of tobacco per annum are grown in France. Algeria furnishes about 7,480,000lbs. The consumption of tobacco in France being so much greater than its production, the difference is furnished by America, which produces annually 286 millions of pounds of tobacco, which are exported to every country in Europe.

CULTIVATION OF THE SORGHUM IN FRANCE.—A letter by M. Joulie, quoted in *The Produce Markets' Review*, says:—"Sorghum sugar grows readily all over France, but it only arrives regularly at maturity in the south, as far as the latitude of Lyons. So if the manufacture of sugar from the sorghum plant could be systematised, it is chiefly in the southern provinces that it would develop a prosperity such as arises in the north from the cultivation of the beet. The cultivation is the simplest possible; as soon as the temperature permits, about the end of March or the beginning of April, the sowing takes place in a properly prepared and ripe soil. The seeds are placed three or four together in holes, about sixty centimetres apart in every direction, and then covered up with two or three centimetres of earth. As the seed is enveloped in two black, hardy coverings to protect it from the damp, its germinative power is extremely slow; this can, however, be easily remedied by soaking the seeds in water two or three days before the sowing takes place. When the sorghum is destined for the production of sugar we must leave only three or four stalks on each tuft, and cut off all the side shoots. This is an indispensable condition if we want to obtain crystallisable sugar; and it can be easily effected by stripping the leaves off the sorghum two or three times during its growth; first when the plant is about thirty centimetres high, next when it is about a metre in height, and lastly when the ears or spikes begin to make their appearance. With these precautions the plant is developed with regularity, and furnishes stems which grow ripe at the same time. My first essays with this plant date as far back as the year 1856, and since that period each crop has supplied me with its own contingent of interesting facts. In the year 1864 I brought together my scattered writings on the subject, and published them under the form of a pamphlet, to which the Pharmaceutical Society of Paris awarded its gold medal. Since that time I have continued my researches, and have gathered new facts, and although the sorghum sugar is as yet only the product of the laboratory, I think I am not stating too much when I say that the time is not very far distant when this plant, cultivated and extended in the south of France, with all the aid that science can give, will be the means of bringing to these districts, which have been so impoverished by the losses from the silkworms, a degree of prosperity analogous to that which the north enjoys by means of the beetroot. The boundaries of our sugar industry would thus be considerably extended, and the beautiful southern districts would no longer be subjected to those violent crises which arise from the slightest variations in the price of corn. Ever since the introduction into France of the seeds of the sorghum sugar by M. de Montigny, this plant has been the object of exaggerated infatuation in the first instance, and finally of undeserved neglect. But sagacious agriculturists have not failed to discern in the meantime that this now graminiferous plant could supply them with a resource in the way of fodder of considerable value, and the culture of this sorghum fodder has accordingly spread unceasingly in the south and in the centre of France."

INJURY TO COFFEE PLANTATIONS.—"How many of your readers, I wonder," says the Madras correspondent of the *Times*, October 22nd, "have heard of the 'borer.' I never myself remember to have seen its name in any English newspaper. But here, in Madras, it has long filled the columns of our press, and lorded it over our dinner tables, until just now it had to give place to the Abyssinian expedition. It is a kind of small grub which infests coffee plantations, and which in the coffee districts of this Presidency has done, and is doing,

mischievous incalculable. A planter told me yesterday that on one of his estates, 320 acres, or about 40,000 trees, had in one season been entirely and irretrievably destroyed by it. He estimated the yearly produce of these trees at £10,000, and considered that of this about half was net profit. The destruction was so sudden as to be inevitable. He had no intimation whatever of danger until he saw the leaves turn yellow and drop, and the trees were then past all hope. This may have been an exceptionally bad case (I mean as regards the extent of the calamity, not as regards the nature, which is almost invariably the same), but there are many more very like. Here and there planters have been positively ruined, and obliged to give up their estates, and leave their homes. There is a report that the Madras Government think of appointing a special commissioner to investigate the subject, and it is, without doubt, well worthy of Governmental notice, for though many doughty champions have entered the list against him, and many schemes have been confidently recommended for his overthrow, the borer does not yet seem to have found his match."

Colonies.

NEW ZEALAND COAL.—It is satisfactory to state that coal has been found in New Zealand suitable for the use of steamers on long sea voyages. There are mines at the Buller and the Grey, and other mines within sixty miles of Nelson, that could be worked, the coals could be put into trucks at 3s. to 5s. per ton, brought by rail and delivered at the port of Nelson at 15s., which would leave a large margin for profit, whilst it would be a saving to the steam companies of about 10s. per ton, the price of imported coal being 30s. to 35s. Here opens a vast field of operations for the port of Nelson to supply the steam-vessels now trading to the port, also to the cities of Nelson, Wellington, Auckland, &c. The Panama boats are supplied at their coaling station at Panama chiefly from Cardiff, at great cost, viz., £4 per ton, taking colliers about 180 days, whilst from Nelson coals could be supplied at about half the price, and in about six weeks. It is pretty obvious, therefore, that Nelson, being 1,000 miles nearer than New South Wales would supply Panama and Oparo, the coaling depôt of the Panama New Zealand Royal Mail Company in the Pacific, which latter could be reached in about a month. This is a matter of the utmost importance in the Panama service, each boat requiring about 1,400 tons for the run, making, with the coasting steamers of this company, about 80,000 tons per annum, and there are other companies whose vessels would coal at Nelson. It appears that the quantity of coals exported from Newcastle to New South Wales, in 1866, was 645,615 tons, a large portion of which is consumed in New Zealand.

PROGRESS OF THE AUSTRALIAN COLONIES.—The area of Australia is 2,582,070 square miles, and its total population in 1861 was 1,266,432. In the year 1865 the gross amount of public revenue in the country was £8,953,092, and the gross amount of expenditure £9,147,499. The total tonnage of vessels entered and cleared during the same year was 4,091,467. During the last fifteen years the value of imports has been largely increasing—in 1852 it was £8,086,225, and in 1865, £35,145,053. The exports have increased from £15,500,000 to more than £30,000,000; and the value of exports to the United Kingdom alone has risen by about £2,000,000. The revenue of New South Wales has increased from £682,000 to over £2,000,000 during the past fifteen years. The exports of gold from Victoria in 1865, were valued at £6,190,317, and that from New Zealand at £2,252,689. The wool exported from New South Wales in the same year was £2,253,149, and that from South Australia was valued at £974,397.

IMMIGRATION.—Victoria, which is the most populous colony of Australia, is, just at the present time, show-

ing the greatest anxiety about increased immigration. Although very much smaller in area than New South Wales, Victoria has a larger population by nearly a quarter of a million. In round numbers, the population of New South Wales is about 400,000; and that of the southern colony 650,000. This great advance has been mainly due to the attraction of the gold-fields, and not to any legislative policy. The annual immigration paid for out of the public fund has, no doubt, helped considerably to swell the numbers, but it would never have peopled the colony up to its present standard. In the great burst of its prosperity Victoria drained the other colonies pretty freely, and also drew largely on America and the old country, but in its turn it has suffered from depletion. Every rush to a gold-field in New South Wales has drawn largely from Victoria. Since the intercolonial communication coastwise has been so abundantly provided for by commodious steamers, there has been a large passing to and fro of passengers. A great many emigrants, who were imported into South Australia at the expense of that colony, continued the journey to Victoria at their own cost; and scores, who lately went to Queensland, have come down south, into New South Wales, thus repaying in part the intercolonial emigration to the new colony which was so marked during the burst of prosperity that followed separation. At the present time there is not only no harmony of action, but no harmony of general policy. Queensland has paid for its immigration in land; New South Wales has paid for it by borrowing money—the most costly and burdensome of all plans; and Victoria and South Australia have paid for it out of the proceeds of land sales, abiding faithful therein to one of the principles of the old Wakefield system. The only point common to the experience of all the colonies, is that immigration has to be purchased in some way or other, unless the attraction of gold can be held out. Gold alone causes a free flow of self-sustained immigration.

ROYAL SOCIETY OF VICTORIA.—At a recent meeting of this Society the Rev. Dr. Bleasdale read a paper on the rubellite, or red tourmaline, a new Victorian gem recently found on Broadfoot lead, Tarrengower. He exhibited a few small specimens of the gem, all embedded in transparent quartz crystals. As a gem, when the colour is perfect, it is of great beauty. Professor Halford reopened a discussion on the phenomena of the blood in cases of snake-poisoning and cholera; and the professor reviewed the leading points of the paper read by him at the last meeting, and in which he had described the blood as minus fibrine, minus oxygen, minus heat, and plus a peculiar new growth of cells. The great similarity of the phenomena in cases of snake-poisoning and cholera led to the inference that the further and microscopic study of the former would give some clue to the nature of the poison believed to exist in zymotic diseases. Dr. D. J. Thomas said he had noticed the presence of the white or colourless corpuscles, spoken of by Professor Halford, in various cases, neither of snake-poisoning nor cholera. He did not believe that the inhalation of oxygen would be of service in cases of snake-bite; but he would rather diminish the oxygen of the body by chloroform fumes and large doses of alcohol.

Obituary.

The Chevalier GABRIANO BONELLI, ex-director of the Italian telegraphs, inventor of the well-known telegraphic apparatus which bears his name, and of the electric loom, died on the 30th September. Signor Bonelli was a distinguished man, of great inventive powers, and scarcely passed the prime of life. Members of the Society will recollect the description of his electric loom, given at an evening meeting, in February, 1860, by Mr. Le Neve Foster.*

* See *Journal*, Vol. VIII., p. 207.

LORD WROTTESLEY, a nobleman who has for many years past devoted himself to the interest of science, died on the 27th October. He was born in August, 1798, and was educated at Christ Church, Oxford, where he took his degree of B.A. in 1819, taking a first class in *Disciplinis Mathematicis et Physicis*. He took a B.A. in 1823, and in the same year was called to the bar by the Hon. Society of Lincoln's-inn. He was married, in 1821, to Sophia Elizabeth, third daughter to the late Thomas Gifford, Esq., of Chillington. In 1839 he received the gold medal of the Royal Astronomical Society, of which he was one of the founders in 1820, for his "Catalogue of the Right Ascensions of 1,318 Stars." In 1853 he called the attention of the House of Lords to Lieutenant Maury's scheme of meteorological observations and discoveries; and on the 30th November, 1854, succeeded the Earl of Rosse as President of the Royal Society, which he resigned in 1857, being succeeded by Sir Benjamin Brodie. He has served in several royal commissions, and is the author of a work entitled "Thoughts on Government and Legislation." The deceased peer was the second baron. In 1841 he succeeded his father, the first baron, who, from 1820 to 1838, represented Staffordshire in the House of Commons, and who was raised to the peerage in 1838, on the recommendation of Lord Melbourne, who was then Prime Minister. Connected with the Wrottesley barony is a baronetcy, created in 1642, the first baronet having received his title for services in the Royal cause during the civil wars. Lord Wrottesley is succeeded in his title and estates by his son Arthur, who was born in 1824.

Publications Issued.

HANDBOOK OF ENGLISH LITERATURE. By William George Larkins, F.R.G.S., F.S.S., Secretary of the Metropolitan Association for Promoting the Education of Adults. (*Routledge*).—This hand-book is intended more especially for the use of students in evening and other classes. It is in two parts, prose and dramatic writers forming the first part, and poets, with an appendix on American writers, the second. The history of the literature is sketched from its foundation, and the writers are divided into periods. Before each of these is an introduction which treats of the influences that affected and characterised it. The leading incidents in the life of each author are then given, followed by a list of his works, with a short critical notice and account of each. The work is devoid of long biographical essays and lengthy illustrative extracts, and seems well adapted for the purpose for which it has been compiled. Each part is published separately, and is complete in itself. The price is one shilling each part.

Notes.

THE STATE OF MIDDLE CLASS EDUCATION.—At the recent annual meeting of the Birmingham Law Society, a report from the committee was read, from which the following is an extract:—"There have been three preliminary examinations for articled clerks in Birmingham during the year; at the first, 14 were examined, of whom nine were passed by the special examiners; at the second, 13 were examined, of whom 7 passed; and at the third, 16 were examined, of whom 12 passed. The necessity for such examinations is fully shown by the amount of inefficiency in the very first elements of education, reading and writing, displayed by some of the candidates. The local examiners have had in some cases to refuse even their certificate for reading, and the dictation papers frequently disclose an utter inability to spell correctly on the part of the candidates,

most of whom appear to be of respectable parentage, and all of whom are, of course, presumed to have completed their education preparatory to entering our learned profession. The want of thoroughness, indeed, in the groundwork of education is extraordinary, considering the standing of the schools at which the candidates appear frequently to have been educated. The same want of thoroughness is also observable in the more advanced and yet primary subjects of a liberal education; the answers given to very simple questions in geography and history being at times very remarkable, as, for instance, placing the Alps in the Island of Sardinia, describing the Duke of Marlborough as a famous British admiral who commanded the Armada, and our great dramatist, Ben Jonson, as celebrated for his dictionary. These examples sufficiently demonstrate the necessity which exists for the preliminary examinations in general knowledge as a means of testing the fitness of a student to enter the ranks of a liberal profession, and the result, in raising the character of that profession by the exclusion of illiterate or imperfectly-educated persons, cannot but be highly beneficial."

Correspondence.

MEMORIAL TABLETS.—**SIR,**—In the interesting and valuable list which you are giving of the houses in London inhabited by England's worthies, I detect an error in your description of the residence of John Evelyn, the diarist. The house in which he lived was situated on the site of the present 44, Dover-street, now in the occupation of Messrs. Moxon, the eminent publishers. To the rear of the house exist remains of a far older structure, no doubt relics of Evelyn's once suburban retreat. Leigh Hunt makes a note, corroborative of this statement, in his "Rambles about the West-end." Begging the favour of insertion of this note in your valuable *Journal*, I am, &c., J. BERTRAND PAYNE, Mem. Soc. Arts.

Conservative Club, S.W., 26th October, 1867.

Journal of the Society of Arts.

FRIDAY, NOVEMBER 8, 1867.

Announcements by the Council.

NOTICE TO MEMBERS.

The One-Hundred-and-Fourteenth Session of the Society will commence on Wednesday, the 20th instant, when the Opening Address will be delivered by WILLIAM HAWES, Esq., F.G.S., Chairman of the Council.

The following are the dates of the Wednesday evening meetings, the chair being taken at 8 o'clock:—

1867. November	—	—	20	27
„ December	4	11	18	—
1868. January	—	—	15	22 29
„ February	5	12	19	26
„ March	4	11	18	25
„ April	1	—	15	22 29
„ May	6	13	20	27
„ June	—	—	—	24*

For the Meetings previous to Christmas, the following arrangements have been made:—

NOVEMBER 20.—Opening Address by WM. HAWES, Esq., F.G.S., Chairman of the Council.

NOVEMBER 27.—“On the Diplomatic and other Conferences held recently in Paris with reference to International Coinage, Weights, and Measures.” By LEONE LEVI, Esq., Professor of Commercial Law in King's College, London.

DECEMBER 4.—“On the Relation between Health and Wages.” By J. H. STALLARD, Esq., M.D.

DECEMBER 11.—“On Industrial and Scientific Education; with Notes on the Systems pursued, and the Works produced, in Continental Schools, as exemplified in the Paris Exhibition, and Suggestions for the Establishment of Trade Schools in England.” By ELLIS A. DAVIDSON, Esq.

DECEMBER 18.—“On the Principles that Govern the Future Development of the Marine Boiler, Engine, and Screw Propeller.” By N. P. BURGH, Esq., C.E.

A book of blank Tickets of Admission to the Meetings is now being forwarded to each Member, who is privileged to introduce two friends to each Meeting, on their presenting orders signed by him. Additional Tickets will be sent on application.

The first course of Cantor Lectures for the ensuing Session will be on some branch of Chemistry applied to the Arts, by Dr. F. Crace Calvert, F.R.S., and will be delivered in the early part of the Session; the second course will be “On Food,” by Dr. Letheby, Medical Officer of Health for the City of London. A third course will be given, the arrangements for which are in progress. Further particulars

will be published in the *Journal*. These Lectures are open to Members, each of whom has the privilege of introducing one Friend to each Lecture.

Members are reminded that, should any of their friends be willing to join the Society, the opening of the Session is a favourable opportunity for proposing them.

The following Institutions have been received into Union since the last announcement:—

Cork, Catholic Young Men's Society.
Guildford, Working Men's Institution.
Parsonstown, Young Men's Christian Association.
Rugeley, Mechanics' Institution.
York, Church Institute.

Proceedings of the Society.

MEMORIAL TABLETS OF GREAT MEN AND EVENTS.

In order to show how rich the metropolis is in the memory of important personages and events, which it would be desirable to mark by means of tablets on houses, the Council have caused an alphabetical list to be prepared, the fifth part of which is now inserted. Other parts will follow. The Council request the assistance of members of the Society in completing and correcting this list, especially with reference to dates and the insertion of other names.

Whilst the Council intend proceeding with this work, they desire also to see it carried on by others—either by corporate bodies or individuals—and the Council will be happy to be instrumental in procuring suitable tablets from the manufacturers.

Lacy, John (d. 1681), the actor; lived from 1665 to his death in Drury-lane, two doors from Lord Anglescy, and near Cradle-alley. He lies buried “in the farther churchyard” of St. Martin's-in-the-fields.

Lamb, Charles (b. 1775—d. 1834), poet and essayist; born in Crown-office-row, Temple, educated at Christ's Hospital, was a clerk in the East India-house, Leaden-hall-street. Lived at No. 4, Inner Temple-lane, Fleet-street; also in Colebrooke-row, Islington; and at No. 20, Russell-street, Covent-garden. He was fond of strolling down Wardour-street.

Lankrink, Prosper Henry (b. 1628—d. 1692), the painter; lived in Piccadilly, in the house now Richardson's Hotel.

Lansdowne, W. Petty, Marquis of (b. 1737—d. 1805); lived in Lansdowne-house, Berkeley-square.

Large, Robert, mercer, the master of Caxton, the inventor of printing; was buried in St. Olave's, Jewry.
Laroone, Marcellus (d. 1702). He drew “The Cries of London, known as Tempest's Cries.” Lived in a house on the west side of Bow-street, three doors up, from 1680 to his death.

Laud, William (b. 1573—d. 1644-5), Archbishop of Canterbury; was imprisoned in the Tower, and beheaded on Tower-hill. He was buried in Allhallows, Barking.

Lauderdale, John Maitland, Duke of (d. 1682), one of the celebrated “Cabal” in the reign of Charles II.; lived in Lauderdale-house, Aldersgate-street.

* The Annual General Meeting: the Chair will be taken at Four o'clock. No Visitors are admitted to this Meeting.

- Lawrence, Sir Thomas** (b. 1769—d. 1860), P.R.A.; lived at No. 24, and afterwards at No. 29, Old Bond-street; also for many years in No. 65, Russell-square, where he died. He lies buried in St. Paul's Cathedral. His last work was a full-length portrait of George IV. (unfinished), which hangs in the coffee-room of the Athenæum Club, Pall-mall.
- Lee, Nathaniel** (d. 1691-2), dramatist. He was educated at Westminster School; was confined in Bedlam for five years. He died at the "Bear and Harrow," in Butcher-row, Strand, and lies buried at St. Clement's Danes, Strand. A portrait of him hangs at the Garrick Club.
- Leland, John** (d. 1652), the father of English antiquaries. Educated at St. Paul's school, and lies buried in St. Michael-the-Querne, Farringdon-within.
- Lely, Sir Peter** (b. 1617—d. 1680), portrait painter; lived from 1662 to his death at the north-east angle of the Piazza, Covent-garden, and lies buried at St. Paul's, Covent-garden.
- Lenthall, William** (b. 1691—d. 1682), Speaker of the House of Commons in the time of the Commonwealth; lived in King-street, Covent-garden, in a house on the site of Westminster Fire Office.
- L'Estrange, Sir Roger** (b. 1616—d. 1704), the printer of the first English newspaper, called the *Public Intelligencer*, in 1663, and many political tracts. He lies buried in the churchyard of St. Giles-in-the-fields.
- Leveridge, R.**, vocalist; after his retirement from the stage he kept a tavern in Tavistock-street, Covent-garden.
- Lillie, Charles**, of the *Spectator*, a perfumer; lived next door to the "Fountain" Tavern, Fountain-court, Strand, afterwards removed to the east corner of Beaufort-buildings, Strand.
- Lilly, William** (b. 1602—d. 1681), the astrologer; married at St. George-the-Martyr's, Southwark. Had his first lessons in astrology from one Evans, a Welsh clergyman, in Gunpowder-alley, Shoe-lane. Lived at the corner house "over against Strand-bridge," Strand.
- Linacre, Thomas** (b. 1460—d. 1524), physician to Henry VIII., and founder of the Royal College of Physicians. He lived at No. 5, Knight-riding-street, Doctors'-commons, and bequeathed this house, called the "Stone-house," to the College, who still possess it.
- Liston, John** (b. 1778—d. 1846), the comedian, and original Paul Pry. First appeared at the Haymarket Theatre. Lived and died at No. 14, St. George's-place. A portrait of him hangs at the Garrick Club. He lies buried in Kensington churchyard.
- Liverpool, Robert, Earl of** (b. 1770—d. 1828), statesman. Educated at the Charterhouse. Lived at Fife-house, Whitehall.
- Locke, John** (b. 1632—d. 1704), author and essayist; educated at Westminster School, and lived at Dorset-court, Fleet-street.
- Logan, John** (d. 1783), a Scottish divine and poet; lived and died in Great Marlborough-street, Oxford-street.
- Loggan, David** (circ. 1630—1690), the engraver, who is immortalized by Dryden; lived next door to the "Golden Head," in Leicester-fields.
- Loudon, George** (d. 1713), the landscape gardener. His style of laying out and stocking gardens is styled by Walpole, "verdant sculpture." Lived in Warwick-street, Cockspur-street.
- Loughborough, Alex. Wedderburne** (b. 1733—d. 1805), Lord Chancellor; lived in Ballimore-house, which now forms the houses on the south-west corner of Guildford-street, Russell-square.
- Loutherbourg, J. P. de** (b. 1734—d. 1812), landscape-painter; lived at No. 45, Great Titchfield-street, Mary-lebone, from 1776 to 1780.
- Lovelace, Richard** (b. 1618—d. 1658), poet and dramatic writer. He lived in a mean-looking house in Gunpowder-alley, Shoe-lane, where he died. He was confined in the Gatehouse Prison, where he wrote his poems "Althea from Prison." He lies buried in St. Bride's, Fleet-street.
- Lowe, Mauritius** (d. 1793), painter; lived in 1778 in No. 3, Hedge-lane, now Wentcomb-street, Pall-mall East.
- Lyndoch, Thomas Graham, Lord** (b. 1749—d. 1845), the hero of Barossa; lived and died in No. 12, Stratton-street, Piccadilly.
- Lysons, Samuel** (b. 1763—d. 1819), the antiquary, and author of "Magna Britannica;" had chambers at No. 6, King's-bench-walk, Inner Temple.
- Lyttleton, Sir Edward** (b. 1689—d. 1645), Lord Chief Justice; lived in (No.—?) Boswell-court, Fleet-street. Was a member of the Inner Temple.
- Macaulay, Lord** (d. 1859), historian; lived in the Albany, in set No. 1 F. Here he wrote his "History of England."
- Mackintosh, Sir James** (b. 1765—d. 1832), statesman and lawyer; lived in 1788 at a wine-merchant's in Clipstone-street, Fitzroy-square. He died at No. 14, Langham-place, Regent-street.
- Macklin, Charles** (b. 1690—d. 1797), actor and dramatic writer. He delivered his lectures on elocution at Pewterer's Hall, 17, Lime-street. He lived and died at No. 4, Tavistock-row, Covent-garden. He lies buried in St. Paul's, Covent-garden, in a vault under the communion-table.
- Major, Thomas** (d. 1799), the engraver; lived and died in No. 5, Tavistock-row, Covent-garden, in the front room on the second-floor.
- Malmesbury, James Harris, Earl of** (b. 1746—d. 1820); lived in No. 21, Hill-street, Berkeley-square.
- Malone, Edmund** (b. 1741—d. 1812), the Shakespeare commentator and author; lived at No. 23, Foley-place, Regent-street; and in 1800 at No. 68, Queen Anne-street, East, Cavendish-square.
- Mansfield, William Murray, Earl of** (b. 1704—d. 1793), Lord Chief Justice; when Mr. Murray, he had chambers at No. 5, King's-bench-walk, Inner Temple; afterwards he lived at the north end of the east side of Bloomsbury-square; this was the house which was burnt by the rioters of 1780. A marble statue to his memory, by Flaxman, stands in Westminster Abbey.
- Manton, Joseph**, the celebrated gun-maker; lived in 1792 in Davies-street, Berkeley-square.
- Marriott, Richard**, the publisher of Isaac Walton; lived and published the first edition of the "Compleat Angler," at St. Dunstan's-churchyard, Fleet-street.
- Marvell, Andrew** (b. 1620—d. 1678), patriot, writer, and poet; lived in (No.—?) Maiden-lane, Covent-garden in 1677; buried in St. Giles-in-the-fields. A portrait of him hangs in the British Museum.
- Masham, Lady**, the celebrated bed-chamber woman of Queen Anne; lived in Cork-street, Burlington-gardens.
- Mathews, Charles** (b. 1776—d. 1835), comedian; educated at Merchant Taylors' School. One of his first attempts as an actor was made at Short's-gardens, Drury-lane, and another at the lodgings of the aged actor, Charles Macklin, in No. 4, Tavistock-row, Covent-garden. A portrait of him hangs at the Garrick Club.
- May, Thomas** (b. 1595—d. 1650), a dramatic poet. Buried at St. Margaret's, Westminster.
- Mayerne, Sir Theodore** (b. 1572—d. 1655), physician to James I. and Charles I. Built and lived in Lindsey-house, Chelsea; also in St. Martin's-lane. Buried, and a monument erected to him, in St. Martin's-in-the-fields. A portrait of him hangs in the College of Physicians.
- Maynard, Sir John** (b. 1608—d. 1690), sergeant-at-law; lived till his death in Portugal-row, Lincoln's-in-fields.
- Maynwaring, Arthur** (b. 1668—d. 1712), political writer and poet; lived in Essex-street, Strand.
- Mead, Richard** (b. 1675—d. 1754), an eminent physician; lived at No. 49, Great Ormond-street, corner of Povey-place. A monument erected to him in Westminster

- Abbey.** Portraits of him hang at the Royal College of Physicians and at the Foundling Hospital.
- Melbourne, Peniston Lamb, Viscount** (b. 1748—d. 1828); lived at Albany, also at Melbourne-house, Whitehall.
- Melbourne, William Lamb, Viscount** (b. 1779—d. 1848); lived at No. 39, South-street, Grosvenor-square.
- Middlesex, Lionel Cranfield, Earl of** (d. 1645), Lord High Treasurer; lived at Beaufort-house, Chelsea. Buried in Westminster Abbey.
- Milbourne, Luke** (d. 1720), a divine and poet, rector of St. Ethelburga; educated at Merchant Taylors' School.
- Mildmay, Sir Walter** (d. 1589), Chancellor of the Exchequer, and founder of Emanuel College, Cambridge; lived in 1570 in his house in Paul's-wharf. He lies buried, and a fine monument is erected to him, in St. Bartholomew-the-Great, West Smithfield.
- Mill, James** (b. 1773—d. 1836), the historian of India; was a clerk in the East India-house, Leadenhall-street.
- Milton, John** (b. 1608—d. 1674), the poet; born in (No.—?), Bread-street, Cheapside, and baptized in the adjoining church of Allhallows; educated at St. Paul's School. He lived in numerous places in London, amongst them at (No.—?), Aldersgate-street; in the Barbican; in St. Bride's churchyard, Fleet-street; at the house of one Thomson, next to the "Bullhead" Tavern, Charing-cross; at Petty France, St. James's-park; at Jewin-street, where he lived with his third wife; at Little Britain, Aldersgate-street, in the house of an auctioneer named Millington; and he died in Bunhill, opposite the Artillery-ground wall. He was buried in St. Giles, Cripplegate, and a bust to his memory stands in Westminster Abbey. He was married to his second wife at St. Margaret's, Westminster. His grand-daughter kept a chandler's shop in Pelham-street, Spitalfields.
- Mohun, Major Michael** (d. 1684), actor; lived from 1671-76 on the east side of Bow-street, Covent-garden; on the south side of Great Russell-street, Bloomsbury, in 1665; and in (No.—?) Brownlow-street, Holborn, where he died. He lies buried in St. Giles-in-the-Fields.
- Monk, George, Duke of Albemarle**, the restorer of Charles II. to his crown and kingdoms; resided in St. James's Palace, and at the Cockpit, Whitehall, where he died. He was married to Anne Clarges, at St. George-the-Martyr, Southwark. He lies buried, and a monument is erected to his memory, in Westminster Abbey.
- Monmouth, James, Duke of** (d. 1685), lived in a mansion on the site of the present Bateman's-buildings, Soho-square; also in Hedge-lane, now Whitcomb-street, Pall-mall East. He was beheaded, and lies buried in St. Peter's ad Vincula.
- Montagu, Lady Mary Wortley** (d. 1762), authoress, and introducer of inoculation into this country; baptised at St. Paul's, Covent-garden. Lived at Arlington-street, Piccadilly; also at (No.—?) Cavendish-square; at the Piazza, Covent-garden, and at (No.—?) George-street, Hanover-square. She lies interred in Grosvenor Chapel, Grosvenor-square, South Audley-street.
- Montague, Ralph, Duke of** (d. 1709), lived at Montague-house, which stood on the site of the British Museum.
- Montague, Elizabeth**, b. 1720—d. 1800, authoress; lived in (No.—?) Hill-street, Berkeley-square; also in Montague-place, Portman-square, which is named after her.
- Montrose, James, Duke of** (d. 1742), celebrated for his fidelity to Charles I. and II.; lived at (No.—?) Hanover-square.
- Moore, Thomas** (b. 1780), the poet, was a Templar; lived at 33, Bury-street, St. James's.
- More, Sir Thomas** (b. 1480—d. 1535), Lord Chancellor; was born in Milk-street, Cheapside. He was educated at St. Anthony's Hospital, a free school, which stood in Threadneedle-street; was a student of Lincoln's-inn; lived at Beaufort-house, Chelsea; also in Bucklersbury-street. He was imprisoned in the Tower, condemned to death at Westminster Hall, and executed on Tower-hill. It is probable he was buried at St. Peter's ad Vincula.
- Morison, Robert** (b. 1620—d. 1683), the botanist and physician; lived in Queen-street, Leicester-square.
- Morland, George** (b. 1763—d. 1804), the painter; lived in 1780 to 1786 at No. 14, Stephen-street, Tottenham-court-road. He died in Eyre-street-hill, Coldbath-fields, and lies buried in the churchyard of St. James' Chapel, Hampstead-road.
- Morland, Sir Samuel** (b. 1625—d. 1695), carried on his mechanical and philosophical experiments at Copt-hall, near the Thames, at Vauxhall.
- Morley, George** (b. 1597—d. 1684), Bishop of Winchester; memorable for having negotiated with the Dutch for the restoration of Charles II.; lived in Cheyne-walk, Chelsea; also in Winchester-house, Southwark.
- Mortimer, J. Hamilton** (b. 1741—d. 1779), historical painter; lived at (No.—?), Norfolk-street, Strand.
- Mountford, William** (b. 1659—d. 1692), eminent actor; lived on the east side of Norfolk-street, Strand, about two doors beyond Howard-street.
- Mulready, W., R.A.**; lived at Lindon-grove, Kensington.
- Munden, Joseph S.** (b. 1758—d. 1832), comedian; lived at No. 2, Bernard-street, Russell-square. Buried at St. George's, Bloomsbury. A portrait of him hangs at the Garrick Club.
- Murphy, Arthur** (b. 1730—d. 1805), dramatic writer; lived at No. 1, New-square, Lincoln's-inn, and at No. 14, Queen's-row, Knightsbridge, where he died.
- Musgrave, Sir William**, presented a collection of prints, books, and MSS. to the British Museum; he lived at No. 9, Park-place, St. James's-square.
- Muskerry, Viscountess**. She was the celebrated Princess of Babylon of De Grammont's memoirs. Lived in the north-west angle of the Piazza, Covent-garden, in 1676.
- Mytens, D.** (b. cir. 1590—d. 1656), painter; lived on the west side of St. Martin's-lane from 1622-34.
- Nash, John** (b. 1752—d. 1835), architect; lived at No. 29, Dover-street, Piccadilly, where he designed Regent-street and Regent's-park; also at Nos. 16 and 14, Regent-street. He designed All Soul's Church, Langham-place; Buckingham Palace, and the United Service Club; he also projected the idea of making the Regent's Canal.
- Nash, Thomas** (b. 1658—d. 1801), the satirist, died in Piccadilly, a street at the back of Middle-row, opposite the Charter House wall, in Goswell-street.
- Naunton, Sir Robert** (d. 1634—5), statesman and author; lived in the "Town's End," the west end of Pall-mall, in 1632.
- Nelson, Horatio, Viscount** (b. 1758—d. 1805); lived in (No.—?) Arlington-street; also at No. 141, New Bond-street, in 1797. He lay in state at the Admiralty, Whitehall, and lies buried in St. Paul's Cathedral, where a monument is erected to him. He met the Duke of Wellington only once, and then at the Colonial Office, 14, Downing-street, Whitehall.
- Nelson, Robert** (b. 1656—d. 1714-15), author of "Fasts and Festivals, &c.;" educated at St. Paul's School; lived at (No.—?) Great Ormond-street; and lies buried at St. George-the-Martyr, Queen-street, Bloomsbury.
- Newcastle, William Cavendish, Duke of** (b. 1592—d. 1676); lived in Dorset-house, Fleet-street, also in Newcastle-house, Lincoln's-inn-fields.
- Newton, Gilbert Stuart, R.A.** (b. 1795—d. 1835), painter; lived in No. 41, Great Marlborough-street.
- Newton, Sir Isaac** (b. 1642—d. 1726-7), philosopher and mathematician; President of the Royal Society. Lived in (No.—?) Jermyn-street, St. James's; also at (No.—?) St. Martin's-street, on the south side of Leicester-square, from 1710 to 1727. He lies buried, and a monument is erected to him, in Westminster Abbey. A portrait of him hangs at the Royal Society, Somerset-house.

- Nichols, John (b. 1744—d. 1826), the archæologist; lived at (No. —?) Highbury-place, Islington; had his printing establishment in Red Lion-court. Buried in the churchyard of St. Mary's, Islington.
- Nicolas, Sir Nicholas Harris (b. 1739—d. 1848), anti-quary, and editor of "Wilson's Despatches;" lived at No. 65, Torrington-square.
- Nollekens, Joseph, sculptor (b. 1737—d. 1823). Baptized at the Roman Catholic Chapel in Duke-street, Lincoln's-inn-fields. He lived and died at No. 9, Mortimer-street, Cavendish-square; and lies buried in the churchyard at Paddington.
- North, Sir Dudley (b. 1641—d. 1691), the great swimmer; lived in Basinghall-street.
- North, Francis, Earl of Guildford (b. 1638—d. 1685), Lord-Keeper; was a Templar, and the means of greatly improving the drainage of London; lived in Elm-court, Temple.
- North, Frederic, Lord, Earl of Guildford (b. 1729—d. 1792), statesman; lived at (No. —?), Grosvenor-square.
- Northcote, James, R.A. (b. 1746—d. 1831), painter, lived and died at 8, Argyll-place, Regent-street.
- Nottingham, Heneage Finch, Earl of (b. 1621—d. 1682), Lord Chancellor; was a member of the Inner Temple, Charles II. dined with him at the Inner-Temple Hall; lived in Great Queen-street, Lincoln's-inn-fields, when his mace was stolen.
- O'Connell, Daniel (b. 1775—d. 1847); lived at No. 19, Bury-street, St. James's, during the struggle for Catholic emancipation, in 1826.
- Ogilby, John (b. 1600—d. 1676), geographer, critic, and poet; kept his map warehouse in Whitefriars; lived in the church of St. Bride's, Fleet-street.
- Oldfield, Anne (b. 1683—d. 1730), actress; lived at the Haymarket from 1714 to 1726, at a house seven doors from the top of the east side, also at Southampton-street, Strand, and at Lower Grosvenor-street, where she died. She was found one day behind the bar of the "Mitre Tavern," St. James's-market, Jernyn-street, rehearsing the "Scornful Lady," when sixteen years old. Lies buried in Westminster Abbey.
- Oliver, Isaac (b. 1556—d. 1617), the miniature painter; lived in Blackfriars, and is buried in St. Anne's church.
- O'Neill, Miss (b. 1791), actress; lived on the west side of Clarges-street, Piccadilly.
- Onslow, Arthur (b. 1691—d. 1768), the Speaker; lived and died in Great Russell-street, Bloomsbury.
- Opie, John, R.A. (b. 1761—d. 1807), painter; lived at 8, Berners-street, Oxford-street. He lies buried in St. Paul's Cathedral, and a portrait of him hangs at the Dulwich Gallery.
- Orleans, Louis-Philippe, Duke of (b. 1747—d. 1793); lived at No. 31, South-street, Grosvenor-square.
- Ormond, James Butler, Duke of (b. 1610—d. 1688); lived at Clarendon-house, Piccadilly; also in St. James's-square; buried in Westminster Abbey.
- Otway, Thomas (b. 1651—d. 1685), poet and dramatic writer; is said to have died from want, in a public-house on Tower-hill; buried at St. Clement Danes, Strand.
- Palmer, John (b. 1747—d. 1798), actor; built the Royalty Theatre, Wellclose-square; he also played at the Surrey Theatre, Blackfriars-road.
- Paoli, Pasquale de (b. 1726—d. 1807), a celebrated Corsican general and patriot; lived at (No. —?), Upper Seymour-street West; also at (No. —?), South Audley-street, Grosvenor-square; a bust of him stands in Westminster Abbey.
- Parnell, Thomas (b. 1679—d. 1717), poet; lived at (No. —?), St. James's-place, St. James's-street.
- Parsons, Wm. (b. 1735—d. 1795), comedian and painter; was the son of a builder in Bow-lane, Cheapside; a portrait of him hangs at the Garrick Club.
- Patrick, Simon, Bishop of Ely (b. 1626—d. 1707; lived at Ely House, which stood on the site of Ely-place, Holborn; was Rector of St. Paul's, Covent-garden, for many years.
- Patterson, Samuel (b. 1728—1802), was the first auctioneer of books, singly and in lots. He lived in Essex-house, Strand.
- Peel, Sir Robert, statesman; lived at the Privy-gardens. He was married in 1820, at No. 45, Upper Seymour-street West.
- Pembroke, Philip-Herbert, Earl of (d. 1649—50); was installed Chancellor of the University of Oxford, at Baynard's Castle-on-the-Thames, immediately below St. Paul's; lived in the Cockpit, Whitehall, also in Durham-house, Strand.
- Penderell, Richard (d. 1671); styled the "Preserver and conduct to his Sacred Majesty King Charles II., after his escape from Worcester Fight;" lies buried, and a monument is erected to him, in St. Giles's-in-the-Fields.
- Penn, William (b. 1644—d. 1718), the founder of Pennsylvania, and an illustrious Quaker; was born on Tower-hill; lived in Norfolk-street, Strand; was in very bad circumstances, and imprisoned in the Fleet. He often preached at a Quaker's meeting-house in a narrow court opposite the gate of St. Edward-the-Martyr, Lombard-street.
- Pennant, Thomas (b. 1726—1798), historian of London, and antiquarian; lived at (No. —?), George-street, Hanover-square.
- Pepys, Samuel (b. 1632—d. 1703); lived at Axe-yard, King-street, Westminster; at Buckingham-street, Strand; at the old Navy Office in Seething-lane, from 1660 to 1669; and at York-buildings, Strand. Was Master of the Clothworkers in 1677. Buried at St. Olave's, Hart-street.
- Perceval, Spencer (b. 1762—d. 1812), statesman; lived at No. 57, now 69, Lincoln's-inn-fields. A monument is erected to him in Westminster Abbey.
- Perry, James (b. 1756—d. 1821), the editor of the *Morning Chronicle* in the days when this was the great Whig paper. He lived at Tavistock-house, Tavistock-square.
- Peter of Colechurch (d. 1205), architect to old London bridge. Was chaplain of St. Mary Colechurch.
- Peter the Great (b. 1672—d. 1725), Czar of Russia; lived in Buckingham-street, Strand, also in Norfolk-street, Strand; and in 1698 in York-buildings, Strand. He used to resort to the "Czar's Head," No. 48, Great Tower-street, Tower-hill.
- Petty, Sir William (*alias* Graunt) (1623-1687), physician and mathematician, and earliest English writer on political economy; lived in the corner house on the east side of Sackville-street, Piccadilly; also at Token-house-yard, Lothbury.
- Philips, Ambrose (b. 1671—d. 1749), pastoral and dramatic poet, and political writer; lived two doors from Slaughter's Coffee-house, in St. Martin's-lane, from 1720 to 1725; also at (No. —?), Hanover-square, where he died. He lies buried in Grosvenor Chapel, South Audley-street.
- Philips, Sir Richard, the bookseller; lived in 48, Brompton-row.
- Phillips, T., R.A. (b. 1770—d. 1845), portrait painter; lived for 40 years at No. 8, George-street, Hanover-square, where he died.
- Picton, Sir Thomas (d. 1815), fell at Waterloo; lived at No. 146, New Bond-street in 1800. He lies buried in the burial-ground of the parish of St. George's, Hanover square, Bayswater.
- Pidgeon, Bat (temp. Queen Anne); well known to all the readers of the "Spectator;" kept his shop at 27, Strand.
- Pindar, Sir Paul (d. 1650), a merchant, who gave very largely towards the restoration of Old St. Paul's. Lived at 169, Bishopsgate-street Without.
- Pinkerton, John (b. 1758—d. 1826), the historian; lived at No. 9, Tavistock-place, Tavistock-square; also in Lower Eaton-street in 1802.
- Pitt, William, Earl of Chatham (b. 1708—d. 1778), statesman; baptised at St. James's Church, Piccadilly.

He was carried to (No. — ?) Downing-street, Whitehall, after his fatal swoon in the House of Lords. He lay in state in the Painted Chamber, Westminster. He lies buried, and a monument is erected to his memory, in Westminster Abbey. A monument of him is also placed in the Guildhall.

Pitt, Right Hon. William (b. 1759—d. 1806), statesman. He was a student at Lincoln's Inn. He lies buried, and a monument is erected to his memory, in Westminster Abbey. His statue in Hanover-square was attempted to be pulled down in 1831 by the Reformers.

Poelemberg, Cornelius (b. 1586—d. 1660), the artist; lived in Archer-street, Great Windmill-street, Piccadilly.

Pope, Alexander (b. 1688—d. 1744), poet; born in (No. — ?) Lombard-street, at his father's linendraper's shop. Was at school at Marylebone, and Hyde-park-corner. He lived in St. James's-street. He became first acquainted with Warburton at Robinson's book shop, Inner Temple-lane.

Pope, Miss (b. 1743—d. 1818), the actress; lived and died at 17, Michael-place, Brompton.

Pope, Mrs. (d. 1797), actress; she lived and died in Halfmoon-street, Piccadilly.

Pope, Sir Thomas (b. 1508—d. 1558), statesman, and founder of Trinity College, Oxford; lived in a large house in Bermondsey.

Porson, Richard (b. 1759—d. 1808), eminent Greek scholar; used to frequent a tavern at No. 20, Maiden-lane, Covent-garden, called the "Cider Cellars." Died in the rooms of the London Institution in the Old Jewry.

Porter, Mrs., the actress, lived over against the "Blue Ball," Arundel-street, Strand.

Portland, Duke of (b. 1738—d. 1809), statesman; lived in Burlington-house.

Prior, Matthew (b. 1664—d. 1731), poet and statesman. He was educated at Westminster School. Lived at (No. — ?) Duke-street, King-street, Westminster. He is buried in Westminster Abbey, and the monument to his memory was erected by himself.

Pritchard, Hannah (b. 1711—d. 1768), actress; she first attracted attention at St. Bartholomew Fair. She lived at (No. — ?) York-street, Covent-garden; and lies buried in Westminster Abbey.

Prynne, William (b. 1600—d. 1669), lawyer and writer; was a student in Lincoln's Inn. He was imprisoned in the Fleet for writing his "Histriomastix," was tried at the Star Chamber, and stood in the pillory in Old Palace Yard. He lies buried in Lincoln's Inn Chapel.

Psalmazar, George (b. 1679—d. 1763), the pretended converted Japanese; lived in Pall-mall. He compiled his "Universal History" at St. College, London-lane, and died in Ironmonger-row, Old-street, St. Luke's.

Pulteney, W., Earl of Bath (b. 1682—d. 1764), statesman; lived on the west side of Arlington-street, Piccadilly; also at Bath-house, Piccadilly. He is buried, and a monument erected to his memory, in Westminster Abbey.

Purcell, Henry (b. 1658—d. 1695), musician and composer; lived at (No. — ?) St. Anne's-lane, Great Peter-street, Westminster. He lies buried, and a monument is erected to his memory, in Westminster Abbey.

Pye, Henry James (b. 1745—d. 1813), poet laureate; lived from 1799 to 1800 at No. 2, James-street, Buckingham-gate.

Pym, John (1584-1643), the Puritan, lived in Gray's-inn-lane, Holborn. He died in Denby-house, Canon-row, Westminster.

Proceedings of Institutions.

BOLTON CHURCH INSTITUTE.—On Monday evening, the 30th September, the prizes and certificates awarded by the Society of Arts and the Department of Science and Art to the candidates connected with this institution, were distributed by John Hick, Esq., of Hill Top. There was a large attendance. The platform was occupied by the Rev. Canon Powell (who presided), the Mayor (F. Ferguson, Esq.), Lieut.-Col. Gray, M.P., the Rev. Canon Thicknesse, the Rev. J. S. Birley, the Rev. T. Berry, Rev. A. Birley, Rev. A. Packer, Rev. J. Lowe (secretary of the Institute), and many others.—The Rev. Vicar commenced the proceedings by observing that they were assembled to inaugurate another working year of the Bolton Church Institute. The operations of last year had largely exceeded their expectations, having had 104 honorary members paying annual subscriptions; 683 quarterly tickets had been sold, the total number of persons who had partaken of the advantages of the Institution being 332. Thus the Institution had been doing its work well. They had now within those walls a flourishing day school, where 70 young gentlemen were having a thoroughly good English liberal education; then they had a reading-room extensively patronised, and well supplied with periodicals and newspapers; and also a museum, with about 1,000 specimens. But the great work going on had been in connection with the classes.—Mr. John Hick delivered an address, and presented the prizes and certificates, concluding his remarks as follows:—"It is further a source of much gratification to find that although we have been at work so short a time, comparatively, our position as an Institution in the Society of Arts' Examination is a good one. Preston only is before us, and that is an older Institution, and we have only to go on steadily persevering, and a still better result is sure to follow. The percentage of failures by the pupils who attended the examinations was very small; but the percentage of those who did not present themselves for examination was much too large; and I would strongly urge upon these latter to make a strong and determined effort this session. Before concluding my remarks, I must just give you a short quotation from the report of Mr. Anderson, Inspector of Machinery at the Royal Arsenal of Woolwich, upon the class in which he has been a juror in Paris. He says—'That there has been no lack of talent or invention is abundantly evidenced by our past history; but unless we have the same advantages, especially in regard to theoretical and mathematical education, which are so abundantly enjoyed by other countries, the competition becomes so unequal that no inherent skill can long withstand it. We require better education for all our leading workmen, and more especially for draughtsmen, foremen, managers, and masters too, and to be given in such abundance all over the kingdom as will not make the possessor the exception, and so cause him to feel above the drudgery of his daily work. Such a general diffusion of systematic theoretical knowledge relating to the principles on which engineering and machine-making depends, will bring out the latent talent of this country. Of practical knowledge and skill there is great abundance, and when in addition the head has been trained as well as the hands, together with the inherent perseverance of our national character, we may still hope to retain our position in the world.' Now, these remarks were in reference to our position as manufacturers of steam-engines and machinery generally, but they are much more generally applicable."—Ald. R. Harwood then briefly explained the circumstances under which he made the offer of a £5 prize to the person who obtained the greatest number of first-class prizes and certificates during the year. It was competed for by two individuals last year who had obtained three first-class prizes—something quite unknown before. The prize was divided last year, and the same result had happened on

The process of the manufacture of glass is very simple, but the art of manipulation is necessary for the formation of a bottle of the simplest form. The tools used are an iron tube about five feet in length, a few instruments like shovels, of different sizes, and stamps with a strawberry-shaped die. The workman first dips the end of the tube into the pot of molten glass, twisting it round so as to accumulate a sufficient quantity of glass to make the required bottle, a few turns of the rod, and a breath or two into it, and a hollow ball appears at the end, and the required shape is given to the hollow globe by means of the shovel-like instruments, whilst being rotated on the glass-maker's wheel, a "poutil" is then attached opposite to the tube, which is then broken off. After being reheated in the furnace the mouth of the bottle is formed, a boy then blows upon the end of a rod a small portion of ruby, aqua marina, or any other colour that may be

required, and the bottle is then blown out and rolled on the iron plate as it is cooled, into a uniform mass of the required length and size. Should the mallefiori be required, the mass is twisted during the blowing, and is then rolled on the iron plate. The mallefiori are slices of coloured glass in a colourless or differently coloured ground material, and are used chiefly for making the *ritorto*, or twisted patterns of mosaic, are fused together with clear glass. These twisted patterns are very simply made; for a goblet, aventurine, for instance, a number of rods of different colours are laid side by side, alternately, and introduced into the furnace, and then to melt and adhere together, the workman dips the end of his rod, at the end of the first, and turning round the rod winds them all up, so that they come together in the form of a cylinder, the end of which is first handled that is to control them during the operations of blowing.

The celebrated frosted, or "crackle" glass, Venetians was long considered a lost art; it is suddenly plunging the hot glass into cold water, in this manner fractures are produced of a character. The glass is then reheated at the furnace, and the heated ball is afterwards expanded by the blow of the bellows. Although frosted glass appears covered with a network of cracks, it is perfectly sonorous.

Venice still possesses the absolute monopoly of glass-making. The manufacture of beads is of the greatest antiquity; they are found in the tombs of the Pharaohs in the ruined temples of Assyria; in the tombs of

The celebrated frosted, or "crackle" glass, Venetians was long considered a lost art; it is suddenly plunging the hot glass into cold water, in this manner fractures are produced of a character. The glass is then reheated at the furnace, and the heated ball is afterwards expanded by the blow of the bellows. Although frosted glass appears covered with a network of cracks, it is perfectly sonorous.

Venice still possesses the absolute monopoly of glass-making. The manufacture of beads is of the greatest antiquity; they are found in the tombs of the Pharaohs in the ruined temples of Assyria; in the tombs of

even in the burial-places of the ancient beads, and these, too, of the particular which has always been, and still is, manufacture, and found over the entire continent the history of the conquest of America, and a most important part, and were used to trade with the natives. At the great impetus has been given to the bead-making of the prevailing fashion of black beads, is a great demand.

Manufacture, or *conteria*, may be divided into branches, the first the ordinary bead, or the other, *Perle alla Lucerna*, which are consequently, more expensive bead. Manufacture of *margaritine* is also divided into the first of common glass beads, *canna di vetro*, and *canna di smalti*, or enamel beads. The first of these last differs but slightly from the "paste" is of a finer quality and more

These are built of a fire clay, found at Cerone; these furnaces last about two years, 44 a year's work. The materials are vitrified (lats) made of pure refractory clay, and for the manufacture of beads are usually four to five in a capable of containing about 1,300lbs. of the furnaces for the finer quality of enamel constructed in a different manner from those for the first. The pots are separated from each other in the furnace, so that the heat can be regulated to the colour and quality of the paste. The principal ingredients used in the manufacture of the first are Pola sand, Catania soda, natron (a native carbonate of soda, found deposited on the sides of the Delta of Egypt), antimony, manganese, minium, nitre, etc.

Materials used for the production of enamel beads are numerous to be enumerated here; almost all of the mineral kingdom might be mentioned, others, gold and silver, of which quantities are used. The Venetians are still in of the best enamel processes, and they supply to all other nations with the best kinds of every possible coloured shade.

The materials are first calcined in a reverberatory furnace, about ten or twelve hours, where they are kept in a pot. Whenever the pots are worked out in the furnace, the "frit" is immediately transferred from the reverberatories in an ignited state; it requires from twelve to seventeen hours, according to quality, to be melted down.

Drawing out of the glass into tubes, or *canna*, is done by "shifts" (*muda*) of six hours each. Each is composed of the gatherer, or *maestro scagnor*, who end of an iron rod into the pot of melted "metal," gathering up the requisite quantity of glass by turn-round round and round. He then hands it over to assistants, or *pastonieri*, who roll the plastic lumps on the iron plate, or "marver" until it assumes a cylindrical form about $4\frac{1}{2}$ inches in diameter, according to quality of bead that is intended to be made; a circular hole is next made with an iron tool (*borrella*) in the direction of the axis of the cylinder, and the other hand applies the end of a solid iron rod, tipped with the glass, called a "punto," and thus attaches it to the opposite end of the cylinder; the two rods are handed over to the *tiratori*, or drawers, who draw the cylinder out into a small tube, in a gallery adjoining the glass house; these galleries are usually about 300 in length. At the end of the "shift" these tubes are cut into lengths of about three feet, and packed into boxes, so as to be passed off to the manufactory, where they are reduced into beads. This is quite a separate process, although sometimes carried on in the same establishment as the first. During the last few months, account of the extraordinary demand and high prices for black beads, most of the glass houses of

Murano and Venice have turned their attention to the production of these glass tubes, or *canna*, for bead manufacturers.

For the production of coloured or enamel beads greater care is necessary, as the materials of which they are composed are costly, especially the imitations of coral, cornelian, ruby, opal, agate, mother-of-pearl, &c.; some of these, as the cornelian, are composed of two qualities of paste, the first opaque, forming the core, and the second transparent, of another colour. The tubes, or *canna*, of which the ingredients contain oxide of gold or silver, do not present their true colour until they have undergone a second action of the fire in the process of reduction into beads. Prismatic tubes are also drawn, and are used for different shaped beads.

Besides the production of an infinity of shades of enamels, or *smalti*, as they are called, Murano still preserves the secrets of producing imitations of precious stones of the most dazzling brilliancy, sapphires, rubies, emeralds, topazes, opals, lapis-lazuli, malachite, and *avventurina*, which is exclusively the speciality of Venice and Murano. The inventor of this most beautiful material was the celebrated Miotti in the 13th century, who discovered it by accident, whilst engaged in the preparation of a certain enamel for mosaic, the name *avventurina* was given to it from *avventura*, which signifies chance. According to the most eminent chemists, *avventurina* owes its rich golden iridescence to a crystalline separation of metallic copper from the mass coloured brown by the peroxide of iron.

The following is an analysis of the *avventurina* of the present celebrated manufacturer, the Cav. Pietro Bigaglia, of Venice:—

Silicic acid	67.3
Lime	9.0
Protoxide of iron	3.4
Binoxide of tin	2.3
Protoxide of lead	1.0
Metallic copper	4.0
Potash	5.3
Soda	7.0

Almost infinite are the uses to which it can be applied in jewellery and ornamentation. The glass-blowers of Murano are enabled to remelt and introduce it as a decoration to their celebrated glass wares.

The reduction of the glass tubes or *canna* into beads, consist of the following operations:—1st. The sorting of the tubes, according to size, as it is impossible in drawing that they should be all equal. This is done by women (*cernitrici*), who acquire by practice a marvellous dexterity at this work. The sorted tubes are next passed over to the *tagliatori*, who chop them into small pieces of uniform lengths, on the upright edge of a fixed chisel. The next operation is the dividing of the bits of tube from the broken pieces by sifting. The next process is to round off the angular ends of these cylinders, and for this purpose they have to undergo a second action of the fire. The workmen employed for this purpose are called *tubanti*, from the tubes used by them for reducing the little bits of glass into beads. This tube is made either of copper, brass, or iron, and is fixed at the end of an iron rod. Before being put into the tube, these little pieces of glass are put into a mixture of lime and powdered ashes, moistened with a little water, and are stirred about until their cavities are filled up. This is necessary to prevent the bore of the bead being partially or wholly closed whilst undergoing the action of the fire. A certain quantity of the little bits of glass are put into the tube with a proportion of sand and powdered ashes, according to the quality of the beads, to prevent their sticking together. The tube is then introduced into the furnace, the heat of which can be regulated as required, and the workman continues turning it round until the cylindrical bits of glass assume a smooth rounded form. The beads are then allowed to cool slowly and afterwards taken out of the

tube and separated by sifting from the sand and ashes. The beads are then sorted according to their various sizes by sifting, and the perfect are separated from the imperfect by being turned out on to a slightly inclined table. Those of a perfectly globular form roll off into a box placed below, whilst the imperfect, badly-shaped ones remain on the table. The workmen employed for this purpose are called *governadori*. The beads are next polished in a very simple manner by the *lustradore*, or polisher, who shakes a certain quantity of them in a bag with a little bran. The finished beads are finally threaded on strings, and tied up in bundles of dozens, grosses, &c. This is chiefly done by women and girls (*infelatrici*).

The art of bead-making at the lamp, "*Perle alla Lucerna*," is, as we have said before, quite a separate business. In working at the lamp, tubes and rods of glass and enamel are used. It is impossible to describe all the manipulations of this ingenious art, over which the taste and dexterity of the artist so entirely preside. But we may give an example: a black bead, decorated with roses, forget-me-nots, and leaves of aventurine. The artist first takes a rod of black glass, and melting it in the blow-pipe flame of the lamp, twists it about an iron wire until he has made a small ball of the required size, rolling it on a kind of iron mould with a circular groove, and smoothing it with an iron tool until it has acquired a perfectly spherical shape. He then takes a small rod of aventurine, and softening it in the flame, traces on the black glass ball leaves of any other pattern that may be required, and smooths it again with the iron tool. He next traces with a small rod of rose-coloured enamel the roses on the ball, smoothing it as before with the smoothing tool. The forget-me-nots are next traced on the bead with a small rod of blue and white enamel, that has been previously twisted together spirally in the flame, and drawn out to about the diameter of a shawl pin. The bead thus completed is taken off the wire, and left to cool in a box filled with sand.

An endless variety of beads are made in this manner of every possible colour. Gold and silver beads are made by rolling a bead made of common glass, whilst still hot, on a leaf of gold or silver; some of these are ornamented with little points of crystal, ruby, turquoise, &c. Artificial eyes for stuffed birds, animals, and even for human beings, are also made at the lamp. Spun glass of every tint is also made, and is used for making feathers and flowers of most surprising lightness, baskets, mats, trays, and even ladies' hats.

Mosaics also constitute a most important branch of manufacture at Venice, and may be divided into two distinct classes. The first, inlaid, or *marqueterie* mosaic, which is produced by all the enamel pieces having their edges perfectly close and adherent one to another; such kind of mosaic is generally used for the production of personal ornaments, such as brooches, earrings, bracelets, &c., or objects of household decoration, such as table tops, and other furniture. The Venetian differ from the Florentine and Roman mosaics, being chiefly of complicated geometrical patterns, of extremely showy colours, in enamels, aventurine, artificial agate, chalcedony, lapis lazuli, &c., instead of being made up of stones, as in the Florentine; or like the Roman mosaics, which are manufactured of very thin pieces of enamels of numberless colours, rubbed and polished, and represent landscapes, fruit, flowers, views, animals, &c.

The other kind of mosaic is made by using stone or enamel pieces, cut into shapes which are not quite regular or geometrical. These pieces are then put together more or less near to each other, so that between them the joints are seen, and the work does not in this case appear smooth, but rough. This style of mosaic is known as the Monumental, or Byzantine. This is most fitted and generally adopted for the purpose of architectural decoration, both for the interior and exterior of buildings.

Venice, in nearly all ages, seems to have been the

home of mosaic, and here the walls of the fine basilica of St. Mark's have been during many ages covered with masterpieces of mosaic decoration.

In England fine specimens of modern Venetian mosaic may be seen at the South Kensington Museum, and St. Paul's Cathedral, London. The whole vaulted roof of Cardinal Wolsey's Chapel, at Windsor, representing the kings and queens of England, is now being decorated in mosaic, a great part of which is already fixed, and Dr. Salvati is now executing mosaics for the National Memorial to the late Prince Consort, now in course of erection in Hyde-park.

Enamels are much more permanent than any other substance that has been used in the composition of mosaic, whether stone, marble, or clay, on account of their less porous and less dilatable body.

With regard to the gold and silver enamels, which are used with such effect in monumental mosaics, great improvement has been made of late years in their production. On a ground of thick glass, or enamel, according as it is desired to render the gold enamel transparent or opaque, or to impart to it a warm or variegated colour, there is laid a leaf of gold or silver, to which it is attached principally by the action of the fire; then a film of the purest glass is spread over it; this film may be perfectly colourless, or of any tint that may be required. When well manufactured, these three layers, after being fired, become perfectly united to each other, and form a homogeneous body. If this operation be perfectly successful, the metal will be for ever protected against all possibility of injury, either by atmospheric action, dust, gas, smoke, or insects, and in such a manner as not to lose any of its brilliancy or colour, even after many centuries of exposure. When this delicate film of glass possesses the requisite thinness, fineness, and purity, and the whole surface of the sheet exhibits no inequality of thickness, the metal appears in all its native beauty, and the glass with which it is covered is scarcely discernible.

The manufacture of mirrors and chandeliers also forms an important branch of industry. These mirrors are usually decorated with figures, leaves, &c., of most original design, engraved at the back, and are afterwards silvered. The frames of these mirrors are decorated with leaves and flowers in white or coloured glass. These mirrors have obtained a great success at the Paris Exhibition, and are being sent in large quantities to Paris and London.

THE AIR IN RAILWAY TUNNELS.

The following report of an examination of the air in the tunnels of the Metropolitan Railway was read at the inquest upon the body of Elizabeth Stainsby, whose death was alleged to have been caused or accelerated through the foulness of the air in the tunnels of the underground railway. The evidence had shown that the deceased was suffering from disease of heart at the time of her death:—

London, October 23rd, 1867.

Having received instructions from the directors of the Metropolitan Railway Company, through Messrs. Burchell, their solicitors, by letter addressed to Dr. Bachoffner, to examine and report on the state of the atmosphere in the different tunnels on their line, and on the sanitary condition generally of the stations and tunnels, we beg to present the following as the result of our investigations:—

We proceeded in the first instance to obtain samples of the air in the tunnels, and we collected them on three separate occasions, namely, first, immediately after the trains had ceased running at night; secondly, just before they commenced running in the morning; and, thirdly, in the afternoon between four and five o'clock, the period of the day when there is generally the greatest amount of traffic.

The samples, twenty-eight in number, were taken at different places in each tunnel, and at different altitudes; some near the crown of the arch, some near the ground, and others on a level with the heads of the passengers. These samples were analysed for sulphurous acid, carbonic acid, carbonic oxide, coal gas, and oxygen.

The presence of sulphurous acid was sought for by the most delicate chemical test with which we are acquainted, namely, its action upon iodic acid and starch, which we have ascertained is capable of showing the presence of one part by volume of sulphurous acid in 100,000 parts of air, but we could not in any case discover by such test the presence of this acid, from which we conclude that its volume was less than the above in the tunnels. The proportion of carbonic acid by volume in 10,000 parts of the air in the several tunnels and stations was as follows:—

Tunnel.	Max.	Min.	Mean.
Tunnel between Bishop's-road and Edgware-road, 2 a.m., Sept. 3rd ..	4.1	4.1	4.1
Tunnel between Edgware-road and Baker-street, 1 to 3 a.m., Sept. 3rd ..	5.2	4.3	4.8
" " 2 to 4 a.m., Sept. 6th ..	5.4	4.7	5.0
" " 4 p.m., Sept. 7th....	5.7
Baker-street Station, 4 p.m., Sept. 10th	6.2
Tunnel between Baker-street and Portland-road, 1 to 3 a.m., Sept. 3rd ..	6.0	4.6	5.1
" " 2 to 4 a.m., Sept. 6th ..	4.5	4.2	4.4
" " 4 p.m., Sept. 7th	6.9
Tunnel between Portland-road and Gower-street, 1 to 3 a.m., Sept. 3rd ..	6.0	5.1	5.5
" " 2 to 4 a.m., Sept. 6th ..	6.1	4.5	5.1
" " 4 p.m., Sept. 7th....	12.7
Gower-street Station, 4 p.m., Sept. 7th	5.7
Tunnel between Gower-street and King's-cross, 1 to 3 a.m., Sept. 3rd ..	5.4	4.4	4.9
" " 2 to 4 a.m., Sept. 6th ..	5.2	4.3	4.6
" " 4 p.m., Sept. 7th....	9.1

The amounts of carbo-hydrogen (coal gas) and of carbonic oxide present were so small as to be barely discoverable by the most delicate processes of analysis. Lastly, we ascertained that the amount of oxygen in the air of the tunnels and stations was not in any case deficient.

These results prove that in no instance was the air found to be vitiated to any material extent, although it will be seen that the air taken in the afternoon was less pure than that taken at night. The researches of Regnault, Bunsen, and other eminent chemists, and more recently those of Dr. Angus Smith, show that what may be termed "model or normal atmospheric air" in cities and large towns consists in every 10,000 parts by volume of

Oxygen	2,096
Nitrogen	7,900
Carbonic acid	4
	10,000

It is the last constituent which when in excess renders the air impure, and, in proportion to its increase, so is the air made unfit for respiration. Experiments conducted by Dr. Bernays and Dr. Angus Smith have shown that in several of our London theatres at about ten o'clock p.m., in many other places of public resort, and especially in some of our law courts, the quantity of carbonic acid in the atmosphere of those places varied from 10 to 32 parts per 10,000; and from the "Army Report," vol. v. page 272, it appears that in some fairly-ventilated barracks at Aldershot the quantity of carbonic acid at midnight amounted to 6.42 per 10,000 of air, and at five p.m. it amounted to 7.59 per 10,000; and in the Wellington Barracks from 11.9 to 14.2 per 10,000.

Even in the streets of Manchester, in foggy weather, it has amounted to eight parts per 10,000 of air.*

In order to determine the atmospheric conditions of these tunnels by comparison with the condition of the air in the tunnels of other lines of railway, we took samples of the air from several tunnels near London, and from these, which we designate by numbers only, we obtained the subjoined results:—

Tunnel No.	Carbonic acid per 10,000 of Air by volume.
1	4.7
2	12.1
3	4.6
4	4.3
5	7.8
6	4.5
7	5.3
8	4.3
9	4.2
10	5.1
11	4.3
12	4.2
13	4.6

Our next inquiries were directed to the quality and quantity of the fuel used in the engines, and to the mode by which its combustion is effected. The plan adopted (with which we cordially agree) is to diminish as far as practicable the combustion of the fuel during the passage of the trains through the tunnels and stations. The steam in the boiler is raised in the open air to a temperature and pressure which, by experience and daily practice, is found sufficient to work the trains through the tunnels; and when the trains come again into open space, fresh steam is then generated sufficient to propel the trains through the next journey, when the process is again repeated; by which means the engine-driver is enabled, when passing through the tunnels and stations, to close the fire-box and damper, so as merely to keep

* AMOUNTS OF CARBONIC ACID PER 10,000 OF AIR IN DIFFERENT PLACES.

the fire in such a condition that it may be easily revived at either end of the journey.

The evolution of the products of combustion is thus almost entirely confined to that portion of the journey when the trains are passing through the open spaces.

The coke is of a superior quality, being made from a coal which is known to be more than usually free from iron pyrites, and it is burnt in the ovens for twenty-four hours longer than the ordinary coke generally used upon railways. In addition to which a staff of eight men and a foreman are constantly employed in examining and selecting the coke, so as to ensure that none but the best quality of coke is transmitted to London for the use of the Underground Railway.

To determine the per-centage of sulphur in the coke, thirteen samples were submitted to chemical analysis, and these gave an average proportion of 0.26 per cent. of sulphur, which is about one-fourth the quantity found in ordinary coke. As regards the coke, therefore, we see nothing to which we can take exception, but, on the contrary, we are of opinion that the best available means are used for obtaining a fuel as free from deleterious matter as possible, in addition to which the combustion of the same is conducted with the view of preventing as far as possible the escape of offensive gases.

The presence of sulphur, or, more correctly speaking, of sulphurous-acid gas, in the tunnels and stations, which at times is appreciable both to taste and smell, more particularly on those days when the external atmosphere is unusually dense, must not be taken as an indication that this gas exists in dangerous quantities, for as little as one part of this gas in 100,000 parts of atmospheric air is strongly perceptible both to taste and smell; and paper moistened with a solution of iodic acid and starch becomes tinged with a blue colour when exposed for a few minutes to air having the above proportion of sulphurous acid. On several occasions we have exposed this delicate test to the air in the tunnels while passing through them, both in the carriages and on the engines; and, although the quantity of air thus brought into contact with the test has been considerable, yet it has only been during the time of active traffic that the test has shown the presence of sulphurous acid, and then in an insignificant degree. In addition to the above, we beg to point out another cause which communicates to the air, more particularly in the stations, a pungent smell, which, although disagreeable, cannot in the slightest degree be regarded as injurious to health; we allude to the partial combustion of the wood forming the breaks when acting upon the tires of the wheels in checking the speed of the train as it approaches the stations.

The number of trips made by the trains through the tunnels daily amounts to 358, of which 284 are by the narrow-gauge trains, and 74 by the broad-gauge. Each of the narrow-gauge trains occupies 20,000 cubic feet of space, and those of the broad-gauge 23,000 cubic feet. The length of time occupied by each train in passing through the tunnels and stations is ten minutes. There are numerous openings communicating with the external atmosphere above, amounting in the aggregate to 3,164 square feet, and distributed in the following manner: namely, Baker-street station, 1,362 square feet; Portland-road station, 863 square feet; Gower-street station, 939 square feet. The western end of the tunnel at Edgware road opens into a large area called the Yard, and, at the eastern end of the tunnel at King's-cross an opening has been made directly into the atmosphere, 40 feet in width, in addition. By an extensive series of thermometric observations we find that there is an average difference of about 1.7° Fahrenheit between the temperature of the tunnels and that of the external atmosphere; the mean outside temperature being 70° Fahrenheit, while the air in the tunnels had a mean temperature of 68.3° Fahrenheit, so that it was 1.7° Fahrenheit colder than the external atmosphere. During the winter months this condition will possibly be reversed;

but in either case there will be a rapid changed air by an ascending and descending current. Having regard to the cubical volume of the trains, the spaces occupied by them in passing through the tunnels and stations, the large volume of air which they displace, and the increased impetus given to the horizontal movement of the air by the rapidity of the transit, we are of opinion that the vitiation of the atmosphere cannot be of a serious character, and this accords with the results of our analysis.

A careful inspection of the tunnels has also shown that they are well constructed, and are generally dry and free from infiltration of liquid or other matter prejudicial to health, with the exception of a portion of the tunnel between Portland-road and Gower-street; to this we directed the attention of Mr. Fenton immediately after our first inspection; and we are happy to be able to add that the defect was at once attended to, and is now in a perfect sanitary condition.

We find on inquiry that the general health of the employees is such as to afford unquestionable proof of the sanitary condition of the air in the tunnels. From a statement furnished to us by Mr. Fenton, it appears that the per-centage of sickness and mortality of these persons is considerably less than that of the employees on the Great Western Railway. To this fact we may add the results of our own personal inquiries, which fully confirm it, as many of the engine-drivers and guards have, we find, been in the service of the company since the opening of the line. They are, to all external appearance, robust, healthy men, and they have assured us that since they were first appointed they have scarcely had a day's illness.

From the foregoing facts, we are enabled confidently to state that the atmosphere of the Metropolitan Railway is not unwholesome or injurious to health.

(Signed)

GEO. H. BACHHOFFNER, Ph.D., F.C.S., &c.

HY. LETHEBY, M.B., M.A., &c., Professor of Chemistry in the College of the London Hospital, and Medical Officer of Health for the City of London.

J. WHITMORE, M.D., &c., Medical Officer of Health, and Chemical Examiner of Gas for the Parish of St. Marylebone.

It may be mentioned that the jury, without hesitation, found a verdict of "Died from natural causes."

PARIS EXHIBITION.

The absolute closing of the Exhibition was officially announced for the day originally fixed, namely, the 31st of October, and the numbers present during the last three days of the month, and especially on the 30th, were enormous. According to some accounts two hundred thousand passed the wickets on that day, but this is probably an exaggeration; a large proportion consisted of the children of the common schools of Paris, whose admission was paid for by the society which was formed for the special purpose of aiding the working classes to visit the Exhibition. On the morning of the 31st October appeared a notice, signed by the Prefect of Police, stating that the Exhibition would remain open three days longer, the rate of admission remaining the same, all gratuitous cards being suspended, and the net proceeds being devoted to public charity. The change thus made at the last moment was unfortunate; the foreign commissioners and exhibitors found their arrangements interfered with, and consented to the delay very unwillingly. The result affords an additional argument for absolute exactitude in carrying out the original plan in all such undertakings. The time has turned out peculiarly unfavourable to the project of aiding the charity funds. The 1st of November being a strict religious *fête* (*Toussaint*) the schools were absent, and the following day being that upon which all Paris visits the

ting-places of relatives and friends, the Exhibition is almost a desert. Moreover, the gallery of the *re de Travail* was closed, and many exhibitors ready packed up their goods. We are not yet what was the attendance on Sunday, but probably have been large, as by that time the people would be are of the change made with respect to the closing. is still a rumour afloat that the Exhibition may main open for some days longer, perhaps at a rate of charge; but the authorities are said to absolutely decided against gratuitous admission, on nt of the difficulty of controlling such an immense of persons as might be expected to attend. e portion of the Exhibition, the horticultural garden, a will in no way interfere with the business proceed- of the other portion, is to be maintained for a time, the weather will soon be too ungenial to render enades there agreeable.

re completion of the list of awards was effected on 30th of October; this new list includes the horticultural and agricultural classes, the hydraulic and other ices of the exhibition itself, and that of the means processes employed by ouvriers working on their account. This list is to be immediately printed and lished in a provisional form, as the former list has 1, but it is announced that, like the first, it may re- numerous corrections, so that a perfect list cannot ooked for for some time, as proofs are to be sent to prize-holders for correction.

he distribution of the medals of the former list is an- nounced to take place as follows:—The gold medals be- ten the 15th and 30th of the present month; the silver ing December; and the bronze between the middle January and the end of February. A diploma will given with each medal, and those for honourable ntion may be expected to be delivered in the month March.

The catalogue of the retrospective collections appeared ly last week, and though it is little more than a bare t of objects, it fills more than 400 pages; it is, how- er, very incomplete, the contributions of Spain, Portugal, ungary, Sweden, and the East, not being included. A w and complete edition is promised shortly.

The presentation to the French Society, by the Royal ife-boat Institution, of the fine English boat exhibited ere, has produced an admirable effect; the Central ociety, which is under the patronage of the Empress, as expressed its hearty thanks for the handsome present, nd has ordered the name of the British Institution to e painted on the bows of the life-boat itself and in- scribed on the list of benefactors to the French society, nd has decided that the boat shall be placed at the alais station as proposed by the donors.

Experiments were made in the artillery practising ound, at Vincennes, the other day, with the life-line pparatus exhibited by the Bremen Society for Saving ife from Shipwreck; the trials were conducted by rench and Prussian officers, and the report is highly ommendatory. The arms used to throw the line are eported to have a range of 400 metres, and to act with very satisfactory precision.

Commerce.

THE SILK TRADE AND THE FRENCH TREATY.—At a meeting of the Macclesfield Chamber of Commerce on Monday last the deputation who recently waited upon Lord Stanley presented a report of the statements which they submitted on the effects of the French treaty upon the silk trade. From this it appears that their plea on behalf of the English manufacturers was that their interests, and the interests of the large number of persons employed by them, were not fully considered when the French treaty was made, since, notwithstanding the enormous advantages which the French silk manufac-

turers were given by the total freedom from duty on silk goods exported to England, the French Government insisted upon retaining duties which were then imposed, and still continued, on certain goods made of silk in this country, and in which England might have stood a fair chance of competing with French manufacturers. Apart from the distress experienced in Spitalfields, the following towns were named as having severely suffered:—Manchester, Derby, Macclesfield, Coventry, Nottingham, Congleton, Leek, and Sandbach. In Macclesfield, in 1859, before the treaty, there were 56 factories, employing 14,000 people; and these have been reduced to 31 factories, employing 5,000 people. There are 2,000 empty houses in the town, or 20 per cent. of the whole, and the sufferings of the workpeople continue to be very great.

Colonies.

RAILWAYS IN VICTORIA.—A statement of the revenue and expenditure on the Victorian Government Railways for the half year ending 30th June, 1867, has been presented to Parliament, from which it appears that the total mileage of the passenger and goods trains was 555,654 miles. The total revenue was £258,960, and the expenditure £131,908, leaving a balance for profit of £127,051. The following are some of the principal items of expenditure:—Locomotives, £49,585; maintenance of permanent way and works, £24,789; passenger and goods traffic and general charges, £57,533. The cost per train per mile was 4s. 8d. The number of passengers was 567,898, paying £104,056. The quantity of goods conveyed was 182,257 tons, realising for carriage £135,802, and £4,840 was received for live stock.

THE EFFECTS OF THE DROUGHT IN SOUTH AUSTRALIA.—It appears that at the close of the year 1863, there were 3,891,600 sheep in the colony, and at the close of 1866 there were 3,911,000, being an increase of only 20,000 in three years, or about $\frac{1}{2}$ per cent., whereas the rate of increase for the years 1861 and 1862 was 12 $\frac{1}{2}$ per cent. per annum. The cattle returns show even a more disastrous result than the sheep; the total number at the close of 1863 was 226,100, and at the close of 1866 their number had been reduced to 123,800. The above returns would be slightly modified by the imports and exports of stock, but it would not materially affect the above result.

REVENUE OF VICTORIA.—The following statement shows the net revenue of the colony of Victoria for the year ended June 3rd, 1867, compared with that of 1866:—

	1866.	1867.
Customs	£1,257,848 ..	£1,160,237
Excise	47,357 ..	48,732
Territorial	773,658 ..	854,743
Public Works	666,469 ..	645,940
Ports and Harbours ..	18,244 ..	17,661
Fines and Fees	97,563 ..	73,151
Postages	137,801 ..	110,787
Miscellaneous	43,120 ..	44,192
	£3,042,060	£2,955,443

QUEENSLAND.—The cotton crop of last season, under very considerable disadvantages, was such as to induce a much larger cultivation in the coming one. Some speak of four times the growth, some more than that; but all agree that the yield of 1866-7 has been such as to justify an enormous increase in 1867-8.

Obituary.

ELIAS HOWE, jun., the inventor of the sewing machine, died on the 3rd of October, in the 48th year of his age, at Bridgport, Connecticut. He was born in 1810, at Spencer, in Massachusetts. At the age of sixteen, he went to work in a manufactory of machinery in Lowell. At the age of seventeen, the closing of the

mills in Lowell sent him adrift, and he afterwards found work in a shop in Cambridge, where he was companion with his cousin, Nathaniel P. Banks, since Governor of Massachusetts, Speaker of the House of Representatives, and Major-General. From Cambridge, he went to Boston, and worked in the shop of Ari Davis, where he first thought of the sewing machine. In April, 1845, he sewed a seam with his machine, and in May of the same year he had completed his work. He procured his patent in 1847. Meeting with little success he went to England, but could accomplish nothing there, and returned to America a poor man in 1849. It was not until 1854 that his machine became a success, and down to that time 8,000 had been manufactured. Now there are scores of different kinds of machines made in America, and during the year ending with June last no less than 170,105 were made in the United States. Mr. Howe at the time of his death received a royalty for every machine manufactured, and the aggregate royalties paid him have amounted to more than 2,000,000 dols.

Notes.

EDUCATIONAL CONGRESS.—The congress appointed to be held at Birmingham on Wednesday, 13th inst., under the direction of the General Committee of the Scholastic Registration Association, will meet in the Midland Institute at eleven o'clock, a.m.; the Rev. J. D. Collis, D.D., F.C.P., Head Master of the Bromsgrove Grammar School, will preside. No alteration has been made in the subjects for discussion, which are as follows:—1. How far will the proposed Scholastic Registration Act tend to raise the Standard of Education throughout the country, and promote the interests and efficiency of the Scholastic profession? 2. How far is the Science of Education capable of development in this country by the more specific training of educators, and by such measures as the institution of a special faculty of Education in the Universities of Great Britain and Ireland? 3. What means can be adopted for training teachers for Upper and Middle Class Schools? Further particulars may be obtained from the Hon. Secretary, Barrow Rule, Esq., Aldershot, and, on the 12th and 13th November, at the Midland Institute, Birmingham.

MEETINGS FOR THE ENSUING WEEK.

- MON.**.....R. Geographical, 8½. 1. The President's Opening Remarks.

Journal of the Society of Arts.

FRIDAY, NOVEMBER 15, 1867.

Announcements by the Council.

NOTICE TO MEMBERS.

The One-Hundred-and-Fourteenth Session of the Society will commence on Wednesday next, the 20th instant, when the Opening Address will be delivered by WILLIAM HAWES, Esq., F.G.S., Chairman of the Council.

The following are the dates of the Wednesday evening meetings, the chair being taken at 8 o'clock:—

1867. November	—	—	20	27
„ December	4	11	18	—
1868. January	—	—	15	22 29
„ February	5	12	19	26
„ March	4	11	18	25
„ April	1	—	15	22 29
„ May	6	13	20	27
„ June	—	—	—	24*

For the Meetings previous to Christmas, the following arrangements have been made:—

NOVEMBER 20.—Opening Address by WM. HAWES, Esq., F.G.S., Chairman of the Council.

NOVEMBER 27.—“On the Diplomatic and other Conferences held recently in Paris with reference to International Coinage, Weights, and Measures.” By LEON LEVI, Esq., Professor of Commercial Law in King's College, London.

DECEMBER 4.—“On the Relation between Health and Wages.” By J. H. STALLARD, Esq., M.D.

DECEMBER 11.—“On Industrial and Scientific Education; with Notes on the Systems pursued, and the Works produced, in Continental Schools, as exemplified in the Paris Exhibition, and Suggestions for the Establishment of Trade Schools in England.” By ELLIS A. DAVIDSON, Esq.

DECEMBER 18.—“On the Principles that Govern the Future Development of the Marine Boiler, Engine, and Screw Propeller.” By N. P. BUCH, Esq., C.E.

A book of blank Tickets of Admission to the Meetings has been forwarded to each Member, who is privileged to introduce two friends to each Meeting, on their presenting orders signed by him. Additional Tickets will be sent on application.

The first course of Cantor Lectures for the ensuing Session will be on some branch of Chemistry applied to the Arts, by Dr. F. Orace Calvert, F.R.S., and will be delivered in the early part of the Session; the second course will be “On Food,” by Dr. Letheby, Medical Officer of Health for the City of London. A third course will be given, the arrangements for which are in progress. Further particulars will be published in the *Journal*. These Lec-

tures are open to Members, each of whom has the privilege of introducing ONE Friend to each Lecture.

Members are reminded that, should any of their friends be willing to join the Society, the opening of the Session is a favourable opportunity for proposing them.

The following Institution has been received into Union since the last announcement:—

Rugby, Evening Classes for Young Women.

Proceedings of the Society.

FOOD COMMITTEE.

A meeting of the committee took place on Saturday, the 9th instant, at 10-30. Present—Mr. Benjamin Shaw, in the chair; Sir W. H. Bodkin; Messrs. Harry Chester, Rev. J. G. Fussell, Rev. Douglas Tining, Edw. Wilson, James Ware, and W. H. Michael.

Messrs. Sorensen and Plahte showed a Norwegian cooking apparatus, of which a description has already appeared in the *Journal*.* The apparatus shown consisted of a stewpan fitting into a box lined with thick felt. A trial was made of the apparatus; a leg of mutton, with vegetables, was placed in the stewpan, boiled for five minutes, and then carefully enclosed in the box, and the lid sealed. When opened, at the expiration of $3\frac{1}{2}$ hours, the whole was found to be perfectly cooked; the temperature of the water being then about 160 degrees Fahrenheit.

Mr. W. Riddle, C.E., attended the committee, and explained a plan for supplying dinners to families ready cooked and hot. He laid before the committee the following statement:—

GENTLEMEN,—To say that a large part of our system of food supply is founded on a cardinal blunder, seems to be to charge the community with a want of common sense, and yet what other conclusion can be come to when we consider how true is Soyer's remark that half the food of the people is wasted, that ten times the necessary fuel is used in its preparation, and that the result is a lamentable failure for want of knowledge and fitness of means and things to the end to be accomplished.

It is especially with regard to the one great meal of the day that the above thoughts apply.

Large classes of the people (apart from the question of money) find great difficulty in providing dinners and getting anything like value for their money. This evil might be vastly ameliorated under a system of commissariat more in accord with economical principles. Take an illustration. In many families, in cities—families of small incomes—the mother is occupied all day in a small shop; she has, besides this, some of her children to attend to, and so at one or two o'clock, in thousands of houses, but meagre fare is seen on the dinner table—out of proportion to the money expended—for it has been ill-spent, and the food ill-cooked. The statement of the special correspondent of the *Daily Telegraph*, that at Glasgow he had a capital dinner of good pea soup, boiled beef, 10oz. potatoes, and pudding—more than he could eat—for, in all, the sum of 5½d., shows what may be done.

It is desirable to lessen the wear and tear of the present system of dinner-getting in these households. The mother—for we will suppose the husband has

* The Annual General Meeting: the Chair will be taken at Four o'clock. No Visitors are admitted to this Meeting.

* Present vol., p. 664, under the heading “Paris Exhibition.”

duties away from home—is frequently obliged to go out in all weathers and use what little skill she may have in buying; she has to see that her servant keeps a proper fire—or, perhaps, she has no servant—and then there is the cooking. Valuable time is thus expended—often extending over hours—which might be spent in earning money; and children are neglected at a time of life when they most require watching.

If we could send round to these thousands of families, and those even of a better grade, dinners ready prepared, and at the lowest remunerative rate, we should open the way to a great deal of good. Buying on a large scale, with experienced buyers, and in the cheapest markets, and wasting nothing because of the magnitude of the operations, we could afford to supply at a very cheap rate. We should want horses, but at Glasgow they require dining-rooms, condiments, table-cloths, cutlery, and waiters.

The waste in small families is (in the aggregate) enormous. A little lemon-peel is wanted, and so an entire lemon is purchased; a little of everything, all of which is not used. They have to encounter adulteration, and fraudulent weights and measures. Day after day the cold joint makes its appearance, and if it is considered economical, it is only so because the family eat cold meat very sparingly, for few people in our London atmosphere and life have the strength to get on with it. One-half the confined boxes called safes, situated close to water-closets and drains at the backs of small houses, are not fit for storing cold joints and other food. Many people have no safes at all. The husband often goes out or stays out, and dines elsewhere, reducing the allowance that can be made for the family dinner, but he says he must keep up his strength. Many a man paying 2s. for his steak and stout in the City, would rather put the 2s. to the family dinner, if such a thing was to be got; but, on the tables of the classes I refer to, Sunday only is the day when a hot dinner of average goodness is seen, and this because of the trouble (in one way or other) of getting it. Or, if the husband gets a holiday and dines at home, he finds that the wife is knocked up and ill, red in the face and cross with her labours, and with no strength nor appetite by the time she has prepared the dinner, which in most cases she cannot trust her one maid to get ready.

Perhaps the one drudge sends up the dearly-purchased joint with half the gravy missing. A little reflection will show the waste, loss of time, vexation, hurry, confusion, bell-ringing of greengrocer, butcher, and others, consequent on the dinner that must be got somehow. The poor professional engraver, artist, draughtsman, copyist—has all the children on his hands,—in his room, because the mistress and her servant are busy as Macbeth's witches (in the kitchen) over the cauldron. This breaks his labours for the day, and has been the ruin of families.

"For want of a nail the shoe was lost."

It is proposed, then, to try and remedy this in a very obvious manner, viz., to cook plain food on a large scale by some one of the fuel-saving apparatus, now well understood. With a tithe of the coal now used in ordinary kitchens, we have seen (thanks to Mr. George Warriner, late Instructor in Cookery at Aldershot), dinners for 2,600 men prepared in—not baking, but roasting-ovens, at the Tower of London. The cleanliness and excellence of the result seemed to leave nothing to be desired.

We propose by some such apparatus to roast, boil, and bake—meat, vegetables, and puddings of a plain description,—to have the meat carved from the joints by fair and skilful carvers,—to have it weighed by assistants alongside, by porcelain-fitted weighing apparatus, and then placed, with gravy, in say 2 lb., 4 lb., and 6 lb. tin cases (lined with pure tin), or in covered cylindrical jars. These covered jars (or cylinders), or tinned vessels, are at once to be placed hot, in hot japanned-iron cases, or cupboards, mounted on a tramway in a room. These

cases to be four or five feet square, and about six inches high. Each of these large cases forms a separated interior of a cart, about the size of an ordinary Parcels Delivery cart, if that is a convenient Loaded in a room of high temperature, with a canisters of food at 212°, they are then slid on a tramway-bench into the cart itself,—sliding into just as a drawer is passed into a chest of drawers—that the japanned iron case is open from the back, the so-called "pigeon-hole" furniture, used for books and documents. The cart into which the said iron case is slid, may be of wood lined with felt. The cart is backed up to the tramway, and attached to a tramway by a bolt while this is being done. Thus loaded, and closed behind by a panel in which as many doors as there are compartments, is now ready off to deliver the goods. Note,—that by having sliding doors in the back part of our cart, we shall be able to expose all the compartments of jars to the cold air in one time. The hind panel of the cart, with the doors, would be felt-packed. The driver is in front, the conductor stands behind, and has with him, hanging from the rear of his cart in a weather-proof cover, and in order by the office clerks, the lists or forms of addresses of customers, and specifying the things to be delivered at each house. These forms he compares with the tickets given up by the house occupiers when food is delivered to them.

The tickets (held by the public) are previously chased from agents selected from tradespeople of the respective neighbourhoods, just as district offices selected by the Parcels Delivery Company.

These tickets might be in printed form, is about fourteen inches long and five inches wide, each page divided into three similar forms; each to contain a printed list of food supplied, with space for the address of purchaser, agent's name, and ruled-off spaces which only require to be filled with figures at the time of ordering, under suitable headings of each size of canister or jar. (See annexed. It gives a rough idea of the principle.)

TO THE HEAD-QUARTERS, MOORGATE-STREET, OF THE PROVISIONS DELIVERY COMPANY.

Order taken Nov. 14, 1867.

FARE FOR CHOICE.	Can.	
	2 lb.	4 lb.
Roast beef	1	1
Mutton	1	1
Potatoes	1	1
Greens	1	1
Plum pudding		
Rice		1

Number 147.

Office 11.

Please deliver the above to

Mr. S. Smith,

10, Guildford-street.

To be delivered

Nov. 18th, 1867.

John Giles, agent,
West-street.

The agent fills in the figures, address of buyer, date, and signature. Probably he will not be allowed to fill less than six tickets. Each page of his printed book is a ticket. One-third is given to the buyer, one-third sent to head-quarters, and one-third remains in the agent's book. In taking six tickets, then, it will be seen that the thirds of six pages are given to the buyer. If all the six dinners (or any number) ordered are delivered, the first ticket only need be filled in in full by the agent. The buyer of the tickets will give them to

by day to the conductors of the carts (when call with the food), who will file them on a on the top of his cart, and under shelter. He will in them at head-quarters as vouchers of delivery. portion of the page of the book sent to head-quarters the district agents will enable the secretary's clerks compile the demands on the commissariat stores, and kitchen generally.

This system might be much improved.

The kitchen superintendent will receive draughts, and will get his clerks to fill up printed draughts the purveyors of the raw material—uncooked provisions. There will be check and counter-check, to ensure precision; and, indeed, I may suggest that a military of exactness, trim, and fitness of apparatus, cleanliness and neatness throughout, will be indispensable, and easy if rules are rigidly laid down at first.

It is recommended that the buyers of dinner tickets be furnished by the district agents with boxes on the vedish caloric retaining principle, into which the jars, when delivered from the carts, can be at once placed. It is about a penny or three half-pence a foot. It is leged that in these wadded cases the food will keep hot r hours. Even one of the tea-pot covers recently introduced might suffice.

Any number of hot cases, or closets, might be filled with jars, despatched in a large, closed, furniture sort of an, with despatch across the metropolis, and then shifted on it and mounted on cart frames with the horses attached, miles away from the kitchens.

'Returned empties' may be called for each morning y carts, passed into the scalding-room, inverted, and laced on drainers.

The carving, weighing, and filling-in room may have wooden racks, in which, early each morning, shall be placed the jars or canisters only of the particular days' issue, according to the lists furnished by a clerk.

The puddings may be mixed by machine.

The building in which these several operations of storing, trimming, cooking, carving, and issue would take place, with the requisite offices, should, by preference, be a long structure, glazed in one wall from one end to the other, so that the public might freely inspect what was going on. Under restrictions, they should have free access to see, and to get information. Sausages would be eaten by people who never touch them, if they knew all about them, and had no reason to doubt. We are left in doubt about Dorset butter, now that the *Times*' correspondent says it is rancid butter mitigated by hog's lard. Is all the fruit sound used in the jam trade? Is mineral acid used for pickling? Is beer from the tavern pure? Is cheese reddened by carrot, and gin enlivened by cayenne? Not a tenth of the mustard sold is pure, I have excellent reason to believe. Would not such a project as this, if open as the day (as all things ought to be), assist in the health of the people? Many servants—this *en passant*—are not over clean. On a large scale of our operations cleanliness could be insured. At the risk of being prolix I will say that there is no reason why a factory of the sort our building should be, should not be as clean as a man-of-war. The public, our customers, would have a right to see, and unless they did so we should not soon get their confidence.

The remains of provisions might be sold to the soup-kitchens of the poor, or, if it could be afforded, it might well be a donation for this purpose.

It is believed that if this undertaking were carried out in a respectable manner, and on a sufficient scale, great public economy of fuel and of food would be the result. But, if time is money, there would be a saving in money in thousands of households, for the better education, nursing, or general care of children, time to take them out for air and exercise, which London children don't get enough of, time for duties of washing, mending, clothes-making, sewing-machine work, and self-culture or relaxation.

If this project is executed, may we most confidently

predict that many houses will be rendered happier, healthier, and morally better?

The project could not be kept too simple at first. The Glasgow system is a paying system. The good it must do is immense. Doubtless, at Glasgow, a great deal may be learnt in furtherance of this project, but I would at first be content with a much less variety of food for this project than is given there, or it might not pay.

I have had much to do practically with manufactories and processes, and a very slight alteration, I need hardly say, will sometimes require expenses and alterations all the way through an elaborate organization, even to the printing.

But, simply as we might commence, I see no reason why, eventually, a sort of portable (mobilised) civil commissariat should not become an institution of the country (and a better one than "Watling's Pork-pies," though that is good), even to feeding volunteers on distant review-fields, or gangs of thousands of sturdy navvies, with the aliment which is their strength.

Eventually, we might hope that soup might be provided for the poor, and delivered in the poorest districts in common earthen jars carried in carts; and the system of what I have (perhaps erroneously) denominated "civil commissariat" might extend upwards, so that at one-half Ring and Brymer's or Gunter's prices elaborate dishes of French or other cookery might find a large sale—the demand arising from the reduction of price, and the public becoming used to our system.

To go to the other end of the scale, one word about the very poor. In the depth of winter in London, as early as the dawn, I think it would be a great boon if oatmeal porridge could be delivered to the poor for a little over cost price. The bread and rank butter, and the chicory mixture, called coffee, sold at the stalls, is not a comforting meal compared with porridge made of Scotch coarse oatmeal, milk, water, and molasses, or coarse sugar. The porridge can be made in ten minutes. Children devour it with avidity. In the casual wards it is preferred—according to the testimony of the newspapers. Seven pounds of oatmeal cost about a shilling. and, with the other ingredients, hot penny rations might be sold, for the want of which hot meal thousands sink under calamity. Peas soup is an excellent thing, but hardly a suitable meal to begin a day on, and especially for those suffering from extreme debility and disease, and who are not so much less human than ourselves as some of us seem to imagine.

I will conclude this with one remark, which must be obvious in its truth:—if we wish in these troubled times to prevent political agitation on the part of the people—the great *unfed* as well as the great *unwashed*—we cannot do better than assist them to hot food with the money they earn. Millions of people are almost homeless. There are other Arabs than those of the sandy desert. To feed the people wisely is a matter worthy of Reformers who wish to promote content. A man, like a hungry child, will not cry out when he is filled. To feed the people is to promote good government and the cause of Order.—I am, &c., W. RIDDLE.

10, Larkhall-lane, S., November 9th, 1867.

PARIS EXHIBITION.

Now that the Exhibition is closed, and the general results are pretty well known, it is natural that comparisons should be made between this and the former universal exhibition held in Paris; from such a comparative report, which, though not official, is, we believe, correct, we extract the following memoranda:—

The Exhibition of 1855 occupied 152,052 square metres of space, of which 18,726 were uncovered; the number of exhibitors amounted to 2,175 in fine arts, and 21,779 in agriculture and manufactures; the value of the entire contents of the Exhibition was estimated at 75,000,000 francs (£3,000,000); the expenses amounted to 11,836,522

frances, and the sum received for tickets and admissions to 3,202,485 francs.

The space occupied by the Exhibition of 1867, not including the annex of Billancourt, was forty-four hectares, equal to about 110 English acres, of which the main building covered 148,990 square mètres, or very nearly as much as the whole of the ground covered by the former Exhibition and its annexes; the number of exhibitors was double that of 1855, including 3,721 in the fine art sections alone. The expenses are taken at the original estimate of twenty millions of francs (£800,000), and the receipts at half that sum. It may be mentioned that the means for carrying out the Exhibition were subscribed in the following manner:—Six millions of francs by the government, six millions by the state, and eight millions guaranteed by an association, whose subscriptions are said to have amounted to more than ten millions. The total number of persons, French and foreign, who visited the Exhibition, is stated at twelve millions, but as it was quite impossible to tell how many visits each person made, this total, if correct, must represent not the actual number of persons but of visits to the Exhibition.

According to report, there is a considerable balance in favour of the account of the Exhibition, but as several claims are yet undecided, the announcement of any positive sum must, at least, be premature.

PARIS CENTRAL SCHOOL OF ARCHITECTURE.

This is the youngest of the new schools established in Paris for technical education; it was opened in November, 1865. It was founded by a society, under the new law of limited responsibility, with a capital equivalent to the sum of £16,000, and therefore, although having the support of the Ministers of Public Instruction and of the Beaux Arts and other authorities, is, in fact, a private institution. The school is situated in the Rue d'Enfer, in what was formerly the Hôtel de Chaulnes. The number of pupils admitted at the opening was 54, and in consequence, apparently, of the greater strictness exercised, the number was not increased in the following year; the third session commenced with 78 pupils.

The following extracts from the printed *Programme des conditions* will indicate the constitution and system of the establishment:—

"The school is open to foreigners as well as natives. The fee for the annual course is 850 francs (£34), payable in three instalments, namely, 400 fr. on admission, 225 fr. on the 10th of February, and the remainder on the 10th of May following. In addition to this each pupil is bound to deposit 40 fr., to cover any losses or injury occasioned by his fault. The examination for admission may take place, at the desire of the candidate, either at the school itself, in a provincial town, or before a professor of a foreign university. Each pupil must provide himself with drawing instruments, boards, portfolios, and colours. Those pupils who, in the course of instruction, do not exhibit sufficient aptitude or assiduity for success, are not allowed to continue in the school; and during the first year 19 out of the 54 youths admitted were found incompetent.

Candidates for admission, if examined in Paris, are required to send in a drawing of an ornament in bas-relief; the plan, section, and elevation of a building; and a written composition; these are replaced, in the case of provincials or foreigners, by certificates of local architects. In all cases the candidates are examined orally in the following branches of knowledge:—Arithmetic, including fractions, decimals, the metrical system, roots and powers; algebra, including simple equations, negative quantities, the symbols $\frac{0}{0}$, $\infty \times 0$, $\frac{m}{0}$, roots and

powers of algebraic expressions, radicals of the second degree, and equations of the second degree, and questions relating to compound interest and annuities;

geometry, plane and spherical, with problems; trigonometry; descriptive geometry, conic sections, curved surfaces, and plane sections; geography, distribution of sea and land, zones, elements of ethnography, political geography of Asia, explaining the revolutions which have successively changed the geography of China, Tartary, India, the Greek and Mussulman dominations in India, the Assyrian, Persian, Macedonian, Roman, Arab, and Ottoman empires in Western Asia, Phœnicia, Judea, and Egypt; political geography of Europe; revolutions which have changed the distribution of nationalities in the West; maps of Greece and of her colonies in the time of Pericles, of the empire of Alexander, of the Roman empire under Augustus, and of the empire of Charlemagne; Mussulman domination during the khalifat of Cordova; and, lastly, Europe in 1453, 1648, and 1865. In addition to all this those candidates who have already made some progress in architectural studies are invited to submit their drawings or compositions to the examiners, who will take them into consideration as evidence of capacity.

It will be seen that the above requirements are severe, the object of the school being to supply a sound practical training, in place, or rather in aid of, existing institutions, which teach little more than the artistic portion of an architect's education.

The Minister of the Beaux Arts has created four scholarships and four half-scholarships to be competed for by the pupils of the school; the Princess Mathilde and M. Caubert have founded annual prizes, and the ministers, architects, and publishers have made donations of technical publications, which are valued at £340.

During the last session a petition was presented to the Senate in favour of official diplomas for architects; the commission appointed to inquire into the subject decided against the views entertained in the petition, and in favour of the freedom of architecture, and called attention to the new school in the following terms:—"A school bearing the title of the Central School of Architecture was formed two years since; it is based upon the plan of the Central School of Arts and Manufactures, which was created 36 years before, for the training of civil engineers, and which now occupies so important a position in the scientific world. The new school is intended to form architects who study their art in a serious manner, and offers the guarantees which the petitioner asks for.

This school may be said to complete the series of establishments for technical education for which Paris has so long been celebrated.

The inaugural meeting of the session 1867-8 took place on the 11th instant, under the presidency of Henry Cole, Esq., C.B. Mr. Cole attributed the honour which had been conferred upon him, of presiding at the meeting, to the existence of a certain analogy between the Paris School and the Kensington Museum; the latter putting into practice the principles taught at the former. After touching upon the question of construction and ornamentation, Mr. Cole said:—"The arrangements of a public museum differ from those of a religious temple, be it Egyptian, Greek, or Roman; they differ from those of a cathedral or church, reformed or not reformed; they are not those of a fortress, of a crenelated tower, of an imperial palace, or of a feudal castle. A museum is a kind of modern socialist building, where the level is the same for all; there is neither dais nor reserved places, and the architecture of past times aids us but little. Mr. Cole then referred to the fact that the specimens in brick and terra-cotta, illustrative of the new buildings at Kensington, lately exhibited in the Champ de Mars, had been presented to the Conservatoire des Arts-et-Métiers, and would be erected in the garden of that establishment. The architecture of our day, said Mr. Cole, is not studied in cloisters, for the erection of cathedrals, fortresses for nobles, or numerous palaces for kings; it is required to supply the wants of a civilized democracy all over the world, and can only make progress by relying on common sense, directed by science and inspired by art;

therefore to this task architecture ought to apply in all humility. Mr. Cole concluded with the announcement that he had asked and obtained permission to offer a prize to be awarded to the most efficient pupil of the school in figure drawing.

COMMERCIAL SCHOOL OF PARIS.

The commercial school, founded by the Chamber of Commerce of Paris, with the aid of the Ministry of Public Instruction, of which the annual distribution of prizes took place not long since, is a novel establishment, which deserves attention. The view of the Council of the Chamber of Commerce in establishing this school is thus expressed in a printed circular:—"Seeing the development of international relations caused by railways, navigation, telegraphic communications, and new treaties, the Chamber felt that it would be well to found a school, in which youths should be prepared for the various careers of commerce." The period of study is fixed at three years, with a fourth year for improvement; and the course comprehends—moral and religious training, the ordinary elements of education, commercial geography and history, technology, book-keeping, exchange, foreign moneys, weights and measures, commercial correspondence, commercial law, the English, German, and Spanish languages, and drawing. The school is open from eight in the morning till five in the evening, and pupils, who are all out-door scholars, are received from the age of twelve years, and after passing a satisfactory examination in elementary education. Lads under twelve may, however, be admitted to a preparatory course of study in the school. Each scholar pays twenty francs (16s.) per month, in advance, which covers all expenses, with the single exception of books. At the end of the third year of study pupils are examined, and, if qualified, receive certificates of capacity; and at the end of the fourth year the Chamber of Commerce delivers diplomas to those scholars who have given proofs, during that year, of real information and solid instruction; so that, in fact, the school awards two grades of degrees. At the late distribution six pupils received diplomas and quitted the school, and eleven others obtained certificates at the expiration of the ordinary course of three years, and a considerable number of prizes were awarded to junior scholars. Amongst the special prizes was the two *prix d'honneur*, given by the Minister of Public Instruction and the Chamber of Commerce; a third year prize of excellence, and a special prize for book-keeping and accounts, offered by the *Chambre Syndicale*, of Paris. The number of pupils to whom honours were awarded exceeded thirty, and, considering that the establishment is only five years old, such a result promises well for the school.

Fine Arts.

ADDITIONS TO THE NATIONAL GALLERY.—During the vacation interesting and important additions have been made to our National Gallery. Eleven pictures have been acquired from the private collection of Sir Charles Eastlake, made while he was director of the gallery. One of these, a unique production of an artist known all but exclusively as a medallist, has been generously presented by Lady Eastlake. The valuable picture thus acquired, "St. Anthony and St. George," by Pisano, bears on the frame the following inscription:—"Presented to the National Gallery, August, 1867, by Lady Eastlake, in memory of Sir Charles Eastlake, P.R.A., first director of this Gallery." Pisano was a painter of the Veronese school, and belonging to the first half of the fifteenth century, his style is essentially pre-Raphaelite. The

work is delicate in handling as in colour; it is finished as a miniature; gold is used on an embossed surface, as in other pictures by archaic masters of northern Italy. These additions to the gallery belong rather to the early than to the middle or late epochs in Italian art; and they are of special value as giving still greater completeness to our national collection of rare pre-Raphaelite masters, through whom may be traced step by step sustained historic progress in the art of painting. There is a curiously interesting picture by Bono, pupil of the aforesaid Pisano; as late as 1461 this painter was engaged in the Cathedral of Siena, that museum of the middle ages. The subject of the picture is "St. Jerome in the Desert;" in its treatment may be observed a certain German detail, dryness, and literalness, not unfrequently found in the early masters of Northern Italy. The scarce school of Ferrara receives further elucidation in a portrait, striking for individuality, by Giovanui Oriolo. Yet another quattrocento painter of Ferrara, Cosimo Tura, still more amplifies a collection already rich. Mr. Wornum, in his "Epochs," designates Tura as "the Mantegna of Ferrara." The artist succeeded, as court painter, Piero della Francesca, of whom our gallery contains a magnificent example. Tura's "St. Jerome" is hard and dry; the figure, as frequently in these tentative northern schools, suffers as from emaciation of flesh. The second picture by this rare master is among the most attractive of the recent acquisitions; the subject, "The Madonna and Child," has received unusual amplification in a company of saints, playing on violins, &c. We now pass to another school—that of Venice in pre-Titian times. In the Venetian Academy there are few works of more interest, not to say singularity, than those which come from Murano, the island of glass manufacture celebrity. Among the collection in the Venetian Academy may be remembered pictures by Bartolommeo and Antonio Vivarini. Our National Gallery previously possessed a picture by the former; it now receives a production of the other brother, Antonio. In treatment the panel displays the detail, realism, and individual truth which belong to the nascent school of Venice. It is also signalled by the rich harmony of colour which from first to last marks the Venetian manner. In Mr. Wornum's "Epochs" will be found a just estimate of the works of the Brothers Vivarini, the famed painters of Murano. In Mrs. Jameson's "Memoirs of Italian Painters" is found the following passage:—"In the Island of Murano, at Venice, dwelt a family called the Vivarini, who had carried on the art of painting from generation to generation, and who had associated with them some of the early Flemings, thus it was that the painters of the first Venetian school became familiarised with a style of colouring more rich and vivid than was practised in any other part of Italy, and they were among the first who substituted oil painting for distemper." Yet the pictures of the Vivarini still adhere to the older method; indeed, all the works we have hitherto enumerated are in tempera or distemper on wood. It is not, however, on casual view very easy to distinguish between oil and tempera, because the tempera surface has usually received for protection varnish or some glossy coat. Yet another school of the quattrocento—that of Umbria—receives illustration in a picture of "St. Michael and the Dragon," by the Dominican friar, Fra Carnevale. The figure of the saint, which is nearly life-size, and drawn with a firm outline, has the smoothness, delicacy, and tenderness which mark this spiritual school of Umbria. We pass from easel to mural and fresco painting in two heads by Domenico Veneziano, who, nevertheless, ranks as one of the first painters in oil known in Italy; but the handling of these heads is manifestly that of fresco, yet, as often happens, the surface has lost its original aspect by preparations used to preserve the work from destruction. The number of frescoes that have reached England is necessarily small, and these two rare specimens of the process have value on many grounds. Again, we pass to another school, or

rather to another nationality, in an extremely choice panel picture by Vander Goes, of Ghent, a scholar and imitator of John Van Eyck, an artist who enjoyed a great reputation in the latter half of the fourteenth century. His works are scarce. Specially to be admired is the colour and the technical excellence of material and execution thus early perfected in Flanders. The pigments are unchanged and immovable as when first painted. This master-piece hangs as a pendant to the exquisite Memling already possessed by the Gallery. Furthermore, our all but unexampled collection of the works of Rembrandt receives a most important addition in "The Portrait of an Old Lady." This is one of the master's strongest and most characteristic heads; the paint is powerful in impasto, yet liquid. The master's oft-tried opposition between black dress, white frill, and rich-toned flesh has been turned to the utmost account. The head is amazing for individual character. We may, in conclusion, observe on the apparition among the old masters of Reynolds' portrait of Lord Heathfield. It is satisfactory to see how England's great colourist holds his own in competition with Rubens and Moroni. Gainsborough, under like trial, wins equal victory; that master work in landscape art, "The Watering Place," recently removed from Kensington, absolutely gains by juxtaposition with Claude and Poussin.

Manufactures.

FEAT OF A SHEFFIELD FILE MAKER.—The *Ironmonger* records that a few weeks since a file 19 in. long, 8 in. wide, and 1 in. thick, was cut at Messrs. Samuel Newbould and Co.'s, Bridgefield Works, Sheffield. The chisel used in cutting it was upwards of 12 in. in length, and had been made and was held by Samuel Brooks. The striker, with a hammer 22 lb. weight, was Richard Wilson, and not a foul stroke was given. The file is rough on one side, and bastard-cut on the other. Not one of the workmen, except the cutter, could be found to say that it was possible to cut so large a file in one row; but the success was most complete. The file was admired on account of its perfect truth and level. The novelty in the file is this, that, instead of being over-cut and up-cut in rows, one row suffices for over-cutting and one for the up-cut. It is, consequently, truer than it could have been by the other process.

FISH-HOOK MACHINERY.—The *New York Tribune* says:—"At New Haven, Connecticut, we were lately taken to a building in which some scores of men and women were making fish-hooks of various sizes, with machinery invented by Dr. C. O. Crosby, of that city. Into each of the machines, wire of a given size was rapidly passing from a reel, fashioned somewhat like the 'swifts' of our Yankee grandmothers, and being automatically cut into the requisite lengths, bent, flattened at one end, sharpened to a point at the other, bearded and dropped into a box under the machine, needing only to be tempered to make them as perfect, efficient fish-hooks as were ever seen—a single workman thus making 60,000 fish-hooks in a day of ten hours. We said he makes them, but that is inaccurate; he supplies the wire, and then looks on while the machine makes them, without a fault or a possibility of defect, as fast as shingle nails can be made, and equal to any ever used. That they are cheaper than any other need hardly be added. Hitherto we Americans have fished with British-made hooks; but that day is over. The European hooks have till now been made by hand—slowly, clumsily, expensively. We read recently in *The Working Man* (British) an account of the fish-hook manufacture in England, which seems, in the light of what we saw in New Haven, the description of some antediluvian process, invented by Tubal Cain. The wire

is first cut by shears, then heated, then rubbed, then bearded, then pointed by filing, then bent, then shanked, then scoured, then blued or japanned, when they are ready to be counted, papered, and labelled. Each of this is a distinct manual process; and the aggregate cost (not including the material) must be ten times that of making by the automatic Crosby process."

Commerce.

THE CHAMBERS OF COMMERCE OF FRANCE.—An incident has just occurred which can scarcely fail to have some beneficial effect on the commerce of France, and, indeed, of Europe; the Chamber of Commerce of Rouen addressed a circular to the other Chambers with the view of establishing full inquiry into the condition and wants of the commercial world, and received cordial replies to its applications from all sides, and which were published in the *Journal de Rouen*, with the view to draw forth more facts respecting the financial and commercial condition of the country. But it appeared, by an official warning given to the Rouen Chamber, that there exists a ministerial injunction, bearing date 1806, against the interchange of communication between Chambers of Commerce; and that, therefore, the publication of any such documents could not be permitted. The prohibition in question has naturally given rise to many comments, and it is scarcely to be doubted that a Government which has done so much for the improvement of industry and commerce will take the necessary measures not only to remove the prohibition in question, but also to aid the Chambers in collecting and promulgating all the facts and evidences which may be useful in solving commercial questions, and aiding the great industries of the country. This old prohibition may then be converted into a valuable instrument of commercial reform.

Colonies.

STATISTICS OF TASMANIA.—The estimated population of the colony was 97,368 on 31st December, 1866, showing an increase of 2,167 during the year. The general revenue receipts for the year were £245,421, and the expenditure £245,361 7s. 6d. The territorial receipts amounted to £88,342, and the expenditure was £106,740. The commissariat expenditure was £56,460. The total value of the exports was £834,606, against £880,965 in the previous year; and the value of the imports £942,107, against £762,375 in the preceding year. There were 643 vessels, with a tonnage of 10,793 tons, entered inwards, or an increase of 7,627 tons over last year. There are 11 steamers, of a tonnage of 2,944 tons, and 200 vessels, with a burden of 16,825 tons, belonging to the ports of Launceston and Hobart Town. Nine vessels were employed in the whale fishery, and the quantity of oil taken was 380 tons, valued at £33,000. In the year 1866 the quantity of land sold was 61,368 acres, realising £35,623; at the end of the year 2,251,071 acres were held under depasturing licenses, at a rental of £9,303 per annum. The total quantity of land in a state of cultivation was 279,022 acres, of which 111,156 acres were not under crop. The total acreage under wheat was 71,348; oats, 34,358; peas, 3,655; potatoes, 10,820; barley, 4,596; hay, 33,762; tobacco, 216. There is a large increase in oats, peas, potatoes, and tobacco. The total number of horned cattle in the colony was 88,370, 21,667 horses, 1,722,804 sheep, 2,486 goats, and 33,259 pigs.

THE IMPORTS OF AUSTRALIAN WOOL have increased very largely again this year, having attained an aggregate in the four months ended 30th April, of 32,708,929 lbs., against 21,934,222 lbs. in the corresponding period of 1866. In 1866 the total quantity of wool imported

3,772,694 lbs., against 109,734,261 lbs. in 1865; 616 lbs. in 1860, 47,489,650 lbs. in 1854, and 567 lbs. in 1848, so that in 20 years the imports of alien wool have thus increased more than fourfold.

Notes.

LEANING PRINTING TYPE.—The cleaning of metal and still more of wood blocks, is a matter of very importance, not only as regards the good printing, specially as respects the preservation of the blocks. *Leblanc Hardel*, a printer, of Caen, complained to a *list*, *M. Guerard Deslauniers*, of the ill-effects of *entine*, and that gentleman, after having made experiments, recommended the use of an essence of petroleum. The advice was followed, and after eighteen *hs'* experience, the report is, that the petroleum, *voling* rapidly, does not gum up the type, in fact *leaves* on the face of the metal but a little white powder which is easily removed by means of a soft brush—that it not injure blocks, has no effect in opening the pores of the wood, but on the contrary hardens the surface, *ters* the face of the wood peculiarly smooth and *con-*sequently increases the fineness of the work produced—*y*, the cost of the petroleum is less than half that of *entine*, and the rapidity with which it dries allows forms to be washed without removing them from press or machine.

NEW METHOD OF FEEDING SHEEP.—A grazier in the *de Calais*, named *Pentefort*, has introduced the following novel and clever method of economising his green *ps*: he places on the ground a rack or fence across the *ole* field, and the sheep feed between the bars. When animals have consumed all the herbage within their *ch*, the rack is moved forward so as to give them a *th* supply of forage. Of course, the rack is so made *at* the sheep cannot jump over it. It is evident that *gularity* in cropping and in the distribution of the *nure*, as well as great economy, must be the result of *a* novel system.

SCHOOL OF MINING AT ST. ETIENNE.—The Minister of *griculture*, Commerce, and Public Works has just *ued* a new programme for this useful school, the *condi-*tions contained therein to come into force next session. *ne* subjects required from candidates for admission are the French language, arithmetic, geometry, algebra, *ctilinear* trigonometry, and descriptive geometry, the *me* as are required for the examination of a bachelor *science*, with the exception of metallurgy, the *ements* of linear design, and ordinary drawing, and *ne* execution of problems in descriptive geometry. Candidates are received between the ages of sixteen and *wen-*ty-five, but soldiers and sailors, who have served *heir* time in the army or navy, are admitted up to the *go* of twenty-eight. Previous to the examination for *admission* to the school, candidates are required to *undergo* a preliminary examination before an engineer *of* mines, or of roads and bridges, except in the case of *pupils* of the Polytechnic School who have taken a *second-class* degree.

GREAT BALLOON AT THE CHAMP DE MARS.—The fine balloon constructed by *M. Giffard*, and to be seen at *M. Flond's* machine works, just without the limits of the International Exhibition, is attracting great attention, both in the scientific and fashionable world. The object of *M. Giffard* is to obtain a balloon capable of carrying a considerable weight, entirely under control, and able, if necessary, to remain in air during fifteen days or more. These desiderata are attained by the use of a peculiar material in the construction of the balloon itself, of pure hydrogen gas, and of powerful machinery, by means of which the balloon is rendered captive, and drawn down to earth at pleasure. It is said that the construction of the balloon is so perfect, that the loss of gas is

reduced to an insignificant quantity. The contents of the balloon are equal to five thousand cubic metres; its car carries thirteen persons, besides the two aeronauts, and it is attached to a steam-engine by means of a cable three hundred metres in length; the ascent and descent only occupies about ten minutes, and it makes thirty or forty voyages a day. The object of *M. Giffard* is scientific experiment, and especially with regard to the electrical phenomena of the atmosphere; the present ascents are merely preparatory, and with a view to obtain funds for future serious undertakings; many ladies, including the Empress, have made the ascent, and, with one exception, we have never heard of any terror being felt. The wind, of course, causes the balloon to deviate at times considerably from the straight line, but the steam machinery has it in complete command, and the movements of the gigantic pear-shaped body are singularly majestic.

SANITARY MEASURES AT HAVRE.—Since the establishment of a regular line of steamers between Havre and the United States, the Government has occupied itself constantly with the means of securing the town against the invasions of cholera, yellow fever, and other epidemics. At present every vessel that enters Havre is placed under the inspection of an officer of health, and any vessel having had deaths on board during her passage, or having any sick on board, is sent to quarantine at the lazaretto of *Tatihou*, in the *Manche*; the former of these precautions is, however, deemed insufficient, and the latter objectionable, especially in the winter season, as causing the sick to be submitted to an extra sea voyage, and the dangers of a difficult navigation. The subject having been inquired into it has been determined to create at Havre a sanitary establishment, like those which exist at *Marseilles*, and at the mouths of the *Gironde* and of the *Loire*. A large lazaretto is to be formed, but, pending the consideration of two proposed sites, a small establishment is at once to be prepared for the reception of passengers who cannot be at once admitted to free pratique. The lazaretto will consist of two parts, one for the sick and the other for those who are simply under the observation of the sanitary officers. The cost of this temporary place of quarantine is estimated at less than £3,000, and it is ordered to be carried into execution without delay.

MEETINGS FOR THE ENSUING WEEK.

Mon.....Entomological, 7.
Tues ...Anthropological, 8.
 Statistical, 8. Mr. Hyde Clarke, "On Public Instruction in Turkey."
Civil Engineers, 8. Renewed Discussion upon Mr. Byrne's paper, "On the Removal of Organic and Inorganic Substances in Water."
Wed ...Society of Arts, 8. Opening Address by the Chairman of Council.
Geological, 8. 1. Mr. N. Whitley, "On supposed Glacial markings in the Valley of the Exe." 2. Mr. S. V. Wood, jun., and the Rev. J. L. Romer, "On the Glacial and post-Glacial Structure of Lincolnshire and S.E. Yorkshire." 3. Mr. A. B. Wynne, "On Disturbance of the Level of the Land near Youghal."
Thurs ...Linnean, 8. 1. Dr. Hance, "On Chinese *Corylaceæ*." 2. Mr. Scott, "On *Isotria capularis*, R."
FriQuekett Microscopical Club, 8.

Patents.

From Commissioners of Patents' Journal, November 8th.

GRANTS OF PROVISIONAL PROTECTION.

Air-compressing apparatus—2978—F. Seller.
Alumina—2652—W. Croxson and T. C. Hutchinson.
Balloons—3038—M. Henry.
Boats, facilitating, ascending and descending rivers, &c.—3040—V. Cressalles.
Boilers—3000—W. and D. Flaken.
Boilers, &c., heating water for—2773—J. H. Nelson and T. Briggs.
Bolts and nuts—2954—C. D. Abel.

Bolts and nuts, securing—3054—J. Maddocks.
 Bottles, &c.—3018—L. Newton and T. Kershaw.
 Bottles, vases, &c., ornamenting—2570—S. Brown.
 Bottling apparatus—2994—S. Stackard.
 Bread, &c., ozonized—2978—T. Welton.
 Buffers, &c.—2992—J. Mitchell.
 Buildings, &c., ventilating—2968—J. White.
 Buildings, &c., ventilating—3060—A. V. Newton.
 Cartridge cases—2958—C. Duncombe.
 Cattle, &c., regulating the supply of food to—3010—P. Love.
 Cocks or valves for discharging water, &c.—3004—H. Wilson.
 Cornices, &c.—2938—F. W. Waide.
 Cotton, &c., cleaning—3048—J. H. Johnson.
 Croquet mallets—3024—J. Asser.
 Fans for ventilating mines, &c.—2984—T. Lemelle.
 Fibrous substances, spinning, &c.—2932—T. Whitehead.
 File blanks—2972—W. Gray.
 Files, cutting—2990—J. Dodge.
 Furnaces—3042—E. B. Wilson.
 Gas and coke—3032—J. Young.
 Gasellers, &c.—2970—H. W. Sambidge.
 Hats and bonnets—2927—E. T. Hughes.
 Horse ploughs—3052—W. H. A. Bowhay.
 Hydrocarbons, &c., burning the gases arising from the distillation of liquid—3014—G. and E. Dorsett and J. B. Blythe.
 Indicators—3012—J. A. Hopkinson and J. Hopkinson, jun.
 Iron—2957—J. Hargreaves.
 Knitting frames, circular—2628—H. M. Mellor.
 Manures and disinfectants—2994—F. Gerhartz.
 Meat, &c., preserving, curing, &c.—3006—W. R. Lake.
 Metallic screws, moulds for making—3038—W. Potts.
 Musical instruments—3044—J. Smyth and S. Kirby.
 Printing from metal plates and lithographic stones—3034—A. J., W. B., and S. H. Waterlow.
 Railway and other brakes—3026—A. M. Clark.
 Railways—2955—J. Hunter.
 Reaping and mowing machines—3022—C. E. Hall.
 Rice, &c., decorticating—2918—T. Bell and J. Richardson.
 Sewing machines—2962—T. Webb.
 Shuttle tongues—2974—J. Haddock.
 Spinning machinery—2996—J. H. Johnson.
 Urine, &c., treatment of—2998—R. Wear.
 Valves—2812—J. Goodfellow.
 Valves—2854—J. Withinslaw and J. E. Baker.
 Valves, &c.—2980—A. M. Clark.
 Vegetable fibre, bleaching—2623—W. W. Burdon.
 Webbing or gasket for packing, &c.—3046—J. T. Carter.
 Wheat, &c., grinding—2930—T. Kitchen.
 Wheels—2986—R. W. Thomson.
 Window blinds, rollers for—3002—L. Stockman.
 Wood, preparing—2904—W. E. Newton.
 Yarns—2660—A. L. Dickens and H. Heywood.
 Yeast, separating from liquid matters—2652—W. Hall.
